EVOLVE STUDY RESOURCES
FREE WITH NEW TEXTBOOK PURCHASE
EVOLVE.ELSEVIER.COM

YOU'VE JUST PURCHASED MORE THAN A TEXTBOOK!*

Evolve Student Resources for Silvestri: Saunders Comprehensive Review for the NCLEX-RN[®] Examination, Seventh Edition, include the following:

How to Use the Online Practice Questions:

Customize your study session for your time and your own unique needs.

- Pre-test of 75 questions evaluates your current knowledge. These results feed into a personalized Study Calendar to help guide you in your preparation for the NCLEX-RN examination.
- Study Mode: Receive immediate feedback after each question. Select questions by Client Needs, Integrated Process, Alternate Item Format Type, Priority Concept, or specific Content Area. The answer, rationale, test-taking strategy, question codes, priority concepts, and reference sources for further remediation appear immediately after you answer each question.
- Exam Mode: Take a practice exam, and receive your results and feedback at the end. Select questions by Client Needs, Integrated Process, Alternate Item Format Type, Priority Concept, or specific Content Area. Then select the number of questions you'd like to take in your exam—10, 25, 50, or 100. When you've finished the exam, the percentage of questions you answered correctly will be shown in a table, and you can go back to review the correct answers—as well as rationales, test-taking strategies, question codes, priority concepts, and reference(s)—for each question.
- Post-test of 75 questions simulating the NCLEX Client Needs percentages helps you evaluate your progress.

Priority Nursing Action List, Back of Inside Cover

To my parents—

To my mother, Frances Mary,
and in loving memory of my father, Arnold Lawrence,
who taught me to always love, care,
and be the best that I could be.

To All Future Registered Nurses,

Congratulations to you!

You should be very proud and pleased with yourself on your most recent well-deserved accomplishment of completing your nursing program to become a registered nurse. I know that you have worked very hard to become successful and that you have proven to yourself that indeed you can achieve your goals.

In my opinion, you are about to enter the most wonderful and rewarding profession that exists. Your willingness, desire, and ability to assist those who need nursing care will bring great satisfaction to your life. In the profession of nursing, your learning will be a lifelong process. This aspect of the profession makes it stimulating and dynamic. Your learning process will continue to expand and grow as the profession continues to evolve. Your next very important endeavor will be the learning process involved to achieve success in your examination to become a registered nurse.

I am excited and pleased to be able to provide you with the Saunders Pyramid to Success products, which will help you prepare for your next important professional goal, becoming a registered nurse. I want to thank all of my former nursing students whom I have assisted in their studies for the NCLEX-RN[®] examination for their willingness to offer ideas regarding their needs in preparing for licensure. Student ideas have certainly added a special uniqueness to all of the products available in the Saunders Pyramid to Success.

Saunders Pyramid to Success products provide you with everything that you need to ready yourself for the NCLEX-RN examination. These products include material that is required for the NCLEX-RN examination for all nursing students regardless of educational background, specific strengths, areas in need of improvement, or clinical experience during the nursing program.

So let's get started and begin our journey through the Saunders Pyramid to Success, and welcome to the wonderful profession of nursing!

Sincerely,

Funda Anne Silvestri

About the Author

Linda Anne Silvestri, PhD, RN
(Photo by Laurent W. Valliere.)

As a child, I always dreamed of becoming either a nurse or a teacher. Initially I chose to become a nurse because I really wanted to help others, especially those who were ill. Then I realized that both of my dreams could come true; I could be both a nurse and a teacher. So I pursued my dreams.

I received my diploma in nursing at Cooley Dickinson Hospital School of Nursing in Northampton, Massachusetts. Afterward, I worked at Baystate Medical Center in Springfield, Massachusetts, where I cared for clients in acute medical-surgical units, the intensive care unit, the emergency department, pediatric units, and other acute care units. Later I received an associate degree from Holyoke Community College in Holyoke, Massachusetts; my BSN from American International College in Springfield, Massachusetts; and my MSN from Anna Maria College in Paxton, Massachusetts, with a dual major in Nursing Management and Patient Education. I received my PhD in Nursing from the University of Nevada, Las Vegas, and conducted research on self-efficacy and the predictors of NCLEX[®] success. I am also a member of the Honor Society of Nursing, Sigma Theta Tau International, Phi Kappa Phi, the American Nurses Association, the National League for Nursing, the Western Institute of Nursing, the Eastern Nursing Research Society, and the Golden Key International Honour Society. In addition, I received the 2012 Alumna of the Year/Nurse of the Year Award from the University of Nevada, Las Vegas, School of Nursing.

As a native of Springfield, Massachusetts, I began my teaching career as an instructor of medical-surgical nursing and leadership-management nursing in 1981 at Baystate Medical Center School of Nursing. In 1989,

I relocated to Rhode Island and began teaching advanced medical-surgical nursing and psychiatric nursing to RN and LPN students at the Community College of Rhode Island. While teaching there, a group of students approached me for assistance in preparing for the NCLEX examination. I have always had a very special interest in test success for nursing students because of my own personal experiences with testing. Taking tests was never easy for me, and as a student I needed to find methods and strategies that would bring success. My own difficult experiences, desire, and dedication to assist nursing students to overcome the obstacles associated with testing inspired me to develop and write the many products that would foster success with testing. My experiences as a student, nursing educator, and item writer for the NCLEX examinations aided me as I developed a comprehensive review course to prepare nursing graduates for the NCLEX examination.

Later, in 1994, I began teaching medical-surgical nursing at Salve Regina University in Newport, Rhode Island, and I remain there as an adjunct faculty member. I also prepare nursing students at Salve Regina University for the NCLEX-RN examination.

I established Professional Nursing Seminars, Inc. in 1991 and Nursing Reviews, Inc. in 2000. These companies are located in Charlestown, Rhode Island. In 2012, I established an additional company, Nursing Reviews, Inc. in Henderson, Nevada. Both companies are dedicated to helping nursing graduates achieve their goals of becoming registered nurses, licensed practical/vocational nurses, or both.

Today, I am the successful author of numerous review products. Also, I serve as an Elsevier consultant for HESI Live Reviews, the review courses for the NCLEX examinations conducted throughout the country. I am so pleased that you have decided to join me on your journey to success in testing for nursing examinations and for the NCLEX-RN examination!

Preface

“To laugh often and much, to appreciate beauty, to find the best in others, to leave the world a bit better, to know that even one life has breathed easier because you have lived, this is to have succeeded.”

—Ralph Waldo Emerson

Welcome to Saunders Pyramid to Success!

An Essential Resource for Test Success

Saunders Comprehensive Review for the NCLEX-RN® Examination is one in a series of products designed to assist you in achieving your goal of becoming a registered nurse. This text will provide you with a comprehensive review of all nursing content areas specifically related to the new 2016 test plan for the NCLEX-RN examination, which is implemented by the National Council of State Boards of Nursing. This resource will help you achieve success on your nursing examinations during nursing school and on the NCLEX-RN examination.

Organization

This book contains 20 units and 72 chapters. The chapters are designed to identify specific components of nursing content. They contain practice questions, including a critical thinking question, and both multiple-choice and alternate item formats that reflect the chapter content and the 2016 test plan for the NCLEX-RN examination. The final unit contains a 75-question Comprehensive Test. All questions in the book and on the Evolve site are presented in NCLEX-style format.

The new test plan identifies a framework based on Client Needs. These Client Needs categories include Safe and Effective Care Environment, Health Promotion and Maintenance, Psychosocial Integrity, and Physiological Integrity. Integrated Processes are also identified as a component of the test plan. These include Caring, Communication and Documentation, Culture and Spirituality, Nursing Process, and Teaching and Learning. All chapters address the components of the test plan framework.

Special Features of the Book

Pyramid Terms

Pyramid Terms are important to the discussion of the content in the chapters in each unit. Therefore, they are in

bold **green** type throughout the content section of each chapter. The definitions can be found in the Glossary at the end of the book.

Pyramid to Success

The Pyramid to Success, a featured part of each unit introduction, provides you with an overview, guidance, and direction regarding the focus of review in the particular content area, as well as the content area's relative importance to the 2016 test plan for the NCLEX-RN examination. The Pyramid to Success reviews the Client Needs and provides learning objectives as they pertain to the content in that unit. These learning objectives identify the specific components to keep in mind as you review each chapter.

Priority Concepts

Each chapter identifies two Priority Concepts reflective of its content. These Priority Concepts will assist you to focus on the important aspects of the content and associated nursing interventions.

Pyramid Points

Pyramid Points (▲) are placed next to specific content throughout the chapters. The Pyramid Points highlight content that is important for preparing for the NCLEX-RN examination and identify content that is likely to appear on the NCLEX-RN examination.

Pyramid Alerts

Pyramid Alerts are the **red** text found throughout the chapters that alert you to important information about nursing concepts. These alerts identify content that typically appears on the NCLEX-RN examination.

Priority Nursing Actions

Numerous Priority Nursing Actions boxes have been placed throughout the chapters. These boxes present a clinical nursing situation and the priority actions to take in the event of its occurrence. A rationale is provided that explains the correct order of action, along with a reference for additional research. A list of these boxes can be found in the backmatter of the book for easier location.

Critical Thinking: What Should You Do? Questions

Each chapter contains a Critical Thinking: What Should You Do? question. These questions provide a brief clinical scenario related to the content of the chapter and ask you what you should do about the client situation presented. A narrative answer is provided along with a reference source for researching further information.

Special Features Found on Evolve

Pretest and Study Calendar

The accompanying Evolve site contains a 75-question pretest that provides you with feedback on your strengths and weaknesses. The results of your pretest will generate an individualized study calendar to guide you in your preparation for the NCLEX-RN examination.

Heart, Lung, and Bowel Sound Questions

The accompanying Evolve site contains Audio Questions representative of content addressed in the 2016 test plan for the NCLEX-RN examination. Each question presents an audio clip as a component of the question.

Video Questions

The accompanying Evolve site contains Video Questions representative of content addressed in the 2016 test plan for the NCLEX-RN examination. Each question presents a video clip as a component of the question.

Testlet Questions

The accompanying Evolve site contains testlet questions. These question types include a client scenario and several accompanying practice questions that relate to the content of the scenario.

Audio Review Summaries and Animations

The companion Evolve site includes three Audio Review Summaries that cover challenging subject areas addressed in the 2016 test plan for the NCLEX-RN examination, including Pharmacology, Acid-Base Balance, and Fluids and Electrolytes. Animations that present various content areas are also available for viewing.

Practice Questions

While preparing for the NCLEX-RN examination, it is crucial for students to practice taking test questions. This book contains 996 NCLEX-style multiple-choice and alternate item format questions. The accompanying software includes all questions from the book plus additional Evolve questions for a total of more than 5200 questions.

Multiple-Choice and Alternate Item Format Questions

Starting with Unit II, each chapter is followed by a practice test. Each practice test contains several questions reflective of those presented on the NCLEX-RN examination. These questions provide you with practice in

prioritizing, decision-making, and critical thinking skills. **Chapter 1** of this book provides a description of each question type and the answer section. The answer section includes the correct answer, rationale, test-taking strategy, question categories, and reference.

In each practice question, the specific test-taking strategy that will assist you in answering the question correctly is highlighted in bold **blue** type. Specific suggestions for review are identified in the test-taking strategy and are highlighted in bold **magenta** type to provide you with direction for locating the specific content in this book. This highlighting of the specific test-taking strategies and specific content areas in the practice questions will provide you with guidance on what topics to review for further remediation in both Saunders Strategies for Test Success: Passing Nursing School and the NCLEX[®] Exam and Saunders Comprehensive Review for the NCLEX-RN[®] Examination.

The categories identified in each practice question include Level of Cognitive Ability, Client Needs, Integrated Process, Priority Concepts, and the specific nursing Content Area. Every question on the accompanying Evolve site is organized by these question codes, so you can customize your study session to be as specific or as generic as you need. Additionally, normal laboratory reference intervals are provided with each laboratory question.

Pharmacology and Medication Calculations Review

Students consistently state that pharmacology is an area with which they need assistance. The 2016 NCLEX-RN test plan continues to incorporate pharmacology in the examination, but only the generic drug names will be included. Therefore, pharmacology chapters have been included for your review and practice. This book includes 13 pharmacology chapters, a medication and intravenous calculation chapter, and a pediatric medication calculation chapter. Each of these chapters is followed by a practice test that uses the same question format described earlier. This book contains numerous pharmacology questions. Additionally, more than 900 pharmacology questions can be found on the accompanying Evolve site.

How to Use This Book

Saunders Comprehensive Review for the NCLEX-RN[®] Examination is especially designed to help you with your successful journey to the peak of the Saunders Pyramid to Success: becoming a registered nurse! As you begin your journey through this book, you will be introduced to all of the important points regarding the 2016 NCLEX-RN examination, the process of testing, and unique and special tips regarding how to prepare yourself for this very important examination.

You should begin your process through the Saunders Pyramid to Success by reading all of Unit I in this book

and becoming familiar with the central points regarding the NCLEX-RN examination. Read [Chapter 3](#), written by a nursing graduate who recently passed the examination, and note what she has to say about the testing experience. [Chapter 4](#) will provide you with the critical testing strategies that will guide you in selecting the correct option or assist you in selecting an answer to a question if you must guess. Keep these strategies in mind as you proceed through this book. Continue by studying the specific content areas addressed in Units II through XIX. Review the definitions of the Pyramid Terms located in the Glossary and the Pyramid to Success notes, and identify the Client Needs and Learning Objectives specific to the test plan in each area. Read through the chapters and focus on the Pyramid Points and Pyramid Alerts that identify the areas most likely to be tested on the NCLEX-RN examination. Pay particular attention to the Priority Nursing Actions boxes because they provide information about the steps you will take in clinical situations requiring prioritization.

As you read each chapter, identify your areas of strength and those in need of further review. Highlight these areas and test your abilities by answering the Critical Thinking: What Should You Do? question and taking all practice tests provided at the end of the chapters. Be sure to review all rationales and test-taking strategies.

After reviewing all chapters in the book, turn to Unit XX, the Comprehensive Test. Take this examination and then review each question, answer, and rationale. Identify any areas requiring further review; then take the time to review those areas in both the book and the companion Evolve site. In preparation for the NCLEX-RN examination, be sure to take the pretest and generate your study calendar. Follow the calendar for your review because the calendar represents your pretest results and the best study path to follow based on your strong and weak content areas. Also, be sure to access the Testlets and the Audio Review Summaries as part of your preparation for the NCLEX-RN examination.

Climbing the Pyramid to Success

The purpose of this book is to provide a comprehensive review of the nursing content you will be tested on during the NCLEX-RN examination. However, Saunders Comprehensive Review for the NCLEX-RN[®] Examination is intended to do more than simply prepare you for the rigors of the NCLEX-RN examination; this book is also meant to serve as a valuable study tool that you can refer to throughout your nursing program, with customizable Evolve site selections to help identify and reinforce key content areas.

After using this book for comprehensive content review, your next step on the Pyramid to Success is to get additional practice with a Q&A review product. Saunders Q&A Review for the NCLEX-RN[®] Examination offers more than 6000 unique practice questions in the book and on the companion Evolve site. The questions are focused on the Client Needs and Integrated Processes of the NCLEX-RN test plan, making it easy to access your study area of choice. For on-the-go Q&A review, you can pick up Saunders Q&A Review Cards for the NCLEX-RN[®] Examination.

Your final step on the Pyramid to Success is to master the online review. Saunders Online Review for the NCLEX-RN[®] Examination provides an interactive and individualized platform to get you ready for your final licensure exam. This online course provides 10 high-level content modules, supplemented with instructional videos, animations, audio, illustrations, testlets, and several subject matter exams. End-of-module practice tests are provided along with several Crossing the Finish Line practice tests. In addition, you can assess your progress with a pretest, Test Yourself quizzes, and a comprehensive exam in a computerized environment that prepares you for the actual NCLEX-RN examination.

At the base of the Pyramid to Success are my test-taking strategies, which provide a foundation for understanding and unpacking the complexities of NCLEX-RN examination questions, including alternate item formats. Saunders Strategies for Test Success: Passing Nursing School and the NCLEX[®] Exam takes a detailed look at all of the test-taking strategies you will need to know in order to pass any nursing examination, including the NCLEX-RN. Special tips are integrated for nursing students, and there are more than 1200 practice questions included so you can apply the testing strategies.

Good luck with your journey through the Saunders Pyramid to Success. I wish you continued success throughout your new career as a registered nurse!

Linda Anne Silvestri

Acknowledgments

Sincere appreciation and warmest thanks are extended to the many individuals who in their own ways have contributed to the publication of this book.

First, I want to thank all of my nursing students at the Community College of Rhode Island in Warwick who approached me in 1991 and persuaded me to help them prepare to take the NCLEX-RN[®] examination. Their enthusiasm and inspiration led to the commencement of my professional endeavors in conducting review courses for the NCLEX-RN examination for nursing students. I also thank the numerous nursing students who have attended my review courses for their willingness to share their needs and ideas. Their input has certainly added a special uniqueness to this publication.

I wish to acknowledge all of the nursing faculty who taught in my review courses for the NCLEX-RN examination. Their commitment, dedication, and expertise have certainly helped nursing students to achieve success with the exam.

I want to extend a very special thank you to my niece Dr. Angela Silvestri-Elmore, who functioned as my “super-editor” for this book. In my eyes she is definitely “super,” and her tremendous theoretical and clinical knowledge and expertise and her consistent ideas and input certainly added to the excellent quality of this product. Thank you Angela!

I also wish to offer a very special acknowledgment and thank you to Jane Tyerman for reviewing this entire book to ensure that it included Canadian nursing practice and standards. Thank you, Jane!

I want to acknowledge and sincerely thank my husband, Laurent W. Valliere, or Larry, for his contribution to this publication, for teaching in my review courses for the NCLEX-RN examination, and for his commitment and dedication in helping my nursing students prepare for the NCLEX-RN examination from a nonacademic point of view. Larry has supported my many professional endeavors and was so loyal and loving to me each and every moment as I worked to achieve my professional goals. Larry, thank you so much!

And, a special thank you also goes to Jaskaranjeet Bhullar, RN, BSN, for writing a chapter for this book about her experiences preparing for and taking the NCLEX-RN examination.

I sincerely acknowledge and thank many very important individuals from Elsevier who are so dedicated to my work in creating NCLEX products for nursing students. I thank Yvonne Alexopoulos, Senior Content Strategist, for her continuous assistance, enthusiasm, support, and expert professional guidance as I prepared this publication, and Laurie Gower, Content Development Manager, for her expert ideas as we planned the project and for her continuous support throughout the production process.

And, a special and sincere thank you to Laura Goodrich, Content Development Specialist, for her tremendous amount of support and assistance, for prioritizing for me to keep me on track, for her ideas for the product, and for her professional and expert skills in organizing and maintaining an enormous amount of manuscript for production. I could not have completed this project without Laura—thank you, Laura! I also want to acknowledge Jamie Randall, Content Strategist for all of her assistance in completing this project—thank you, Jamie!

I thank Elodia Dianne Fiorentino for researching content and preparing references for each practice question; Nicholas Silvestri for editing, formatting, and organizing manuscript files for me; James Guilbault for researching and updating medications; and my personal team who participated in reviewing the Evolve site that accompanies this product. A special thank you to all of you for providing continuous support and dedication to my work in preparing this publication and maintaining its excellent quality.

I want to acknowledge all of the staff at Elsevier for their tremendous assistance throughout the preparation and production of this publication and all of the Elsevier staff involved in the publication of previous editions of this outstanding NCLEX review product. A special thank you to all of them. I thank all of the important people in the production and marketing department, including Bill Drone, Book Production Specialist; Danielle LeCompte, Marketing Manager; Jeff Patterson, Publishing Services Manager; Amy Simpson, Multimedia Producer; and Renee Duenow, Designer.

And a special thank you to Loren Wilson, former Senior Vice President, for her years of expert guidance

and continuous support for all of the products in the Pyramid to Success.

I would also like to acknowledge Patricia Mieg, former educational sales representative, who encouraged me to submit my ideas and initial work for the first edition of this book to the W.B. Saunders Company.

A very special and heartfelt thank you goes to my parents, who opened the door of opportunity in education for me. I thank my mother, Frances Mary, for all of her love, support, and assistance as I continuously worked to achieve my professional goals. I thank my father, Arnold Lawrence, who always provided insightful words of encouragement. My memories of his love and support will always remain in my heart. I am certain that he would be very proud of my professional accomplishments.

I also thank my entire family for being continuously supportive, giving, and helpful during my research and preparation of this publication.

I want to especially acknowledge each and every individual who contributed to this publication—the reviewers, contributors, item writers, and updaters—for their expert input and ideas. I also thank the many faculty and student reviewers of the manuscript for

their thoughts and ideas. A very special thank you to all of you!

I also need to thank Salve Regina University for the opportunity to educate nursing students in the baccalaureate nursing program and for its support during my research and writing of this publication. I would like to especially acknowledge my colleagues Dr. Eileen Gray, Dr. Ellen McCarty, and Dr. Bethany Sykes for all of their encouragement and support.

I wish to acknowledge the Community College of Rhode Island, which provided me with the opportunity to educate nursing students in the Associate Degree of Nursing Program. A special thank you goes to Patricia Miller, MSN, RN, and Michelina McClellan, MS, RN, from Baystate Medical Center, School of Nursing, in Springfield, Massachusetts, who were my first mentors in nursing education.

Finally, a very special thank you to all of my nursing students—past, present, and future. All of you light up my life! Your love and dedication to the profession of nursing and your commitment to providing health care will bring never-ending rewards!

Linda Anne Silvestri

UNIT I

NCLEX-RN[®] Exam Preparation

The NCLEX-RN[®] Examination

The Pyramid to Success

Welcome to the Pyramid to Success

Saunders Comprehensive Review for the NCLEX-RN[®] Examination

Saunders Comprehensive Review for the NCLEX-RN[®] Examination is specially designed to help you begin your successful journey to the peak of the pyramid, becoming a registered nurse. As you begin your journey, you will be introduced to all of the important points regarding the NCLEX-RN examination and the process of testing, and to the unique and special tips regarding how to prepare yourself for this important examination. You will read what a nursing graduate who recently passed the NCLEX-RN examination has to say about the test. Important test-taking strategies are detailed. These details will guide you in selecting the correct option or assist you in selecting an answer to a question at which you must guess.

Each unit in this book begins with the Pyramid to Success. The Pyramid to Success addresses specific points related to the NCLEX-RN examination. Client Needs as identified in the test plan framework for the examination are listed as well as learning objectives for the unit. Pyramid Terms are key words that are defined in the glossary at the end of the book and set in color throughout each chapter to direct your attention to significant points for the examination.

Throughout each chapter, you will find Pyramid Point bullets that identify areas most likely to be tested on the NCLEX-RN examination. Read each chapter, and identify your strengths and areas that are in need of further review. Test your strengths and abilities by taking all practice tests provided in this book and on the accompanying Evolve site. Be sure to read all of the rationales and test-taking strategies. The rationale provides you with significant information regarding the correct and incorrect options. The test-taking strategy provides you with the logical path to selecting the correct option. The test-taking strategy also identifies the content area to review, if required. The reference source and page number are provided so that you can easily find the information that you need to review. Each question is coded on the basis of the Level of Cognitive Ability, the Client

Needs category, the Integrated Process, Priority Concepts, and the nursing content area.

Saunders Q&A Review for the NCLEX-RN[®] Examination

Following the completion of your comprehensive review in this book, continue on your journey through the Pyramid to Success with the companion book, Saunders Q&A Review for the NCLEX-RN[®] Examination. This book provides you with more than 6000 practice questions in the multiple-choice and alternate item formats, including audio and video questions. The book is designed based on the NCLEX-RN examination test plan framework, with a specific focus on Client Needs and Integrated Processes. In addition, each practice question in this book includes a Priority Nursing Tip, which provides you with an important piece of information that will be helpful to answer questions. Then, you will be ready for HESI/Saunders Online Review for the NCLEX-RN[®] Examination. Additional products in Saunders Pyramid to Success include Saunders Strategies for Test Success: Passing Nursing School and the NCLEX[®] Exam and Saunders Q&A Review Cards for the NCLEX-RN[®] Exam. These products are described next.

HESI/Saunders Online Review for the NCLEX-RN[®] Examination

This product addresses all areas of the test plan identified by the National Council of State Boards of Nursing (NCSBN). The course contains a pretest that provides feedback regarding your strengths and weaknesses and generates an individualized study schedule in a calendar format. Content review is in an outline format and includes self-check practice questions and testlets (case studies), figures and illustrations, a glossary, and animations and videos. Numerous online exams are included. There are 2500 practice questions; the types of questions in this course include multiple-choice and alternate item formats.

Saunders Strategies for Test Success: Passing Nursing School and the NCLEX[®] Exam

This product focuses on the test-taking strategies that will help you to pass your nursing examinations while in nursing school and will prepare you for the NCLEX-RN

examination. The chapters describe various test-taking strategies and include sample questions that illustrate how to use the strategies. Also included in this book is information on cultural characteristics and practices, pharmacology strategies, medication and intravenous calculations, laboratory values, positioning guidelines, and therapeutic diets. This book has more than 1200 practice questions, and each question provides a tip for the beginning nursing student. The practice questions reflect the framework and the content identified in the NCLEX-RN test plan and include multiple-choice and alternate item format questions, including audio and video questions.

Saunders Q&A Review Cards for the NCLEX-RN® Exam

This product is organized by content area and the framework of the NCLEX-RN test plan. It provides you with 1200 unique practice test questions on portable and easy-to-use cards. The cards have the question on the front of the card, and the answer, rationale, and test-taking strategy are on the back of the card. This product includes multiple-choice questions and alternate item format questions, including fill-in-the-blank, multiple-response, ordered-response, figure, and chart/exhibit questions.

Saunders RNertainment for the NCLEX-RN® Exam

RNertainment: The NCLEX® Review Game, 2nd Edition is a revolutionary board game that offers nursing students a fun and challenging change of pace from standard review options. 800 clinical questions and scenarios cover all the major nursing categories on the NCLEX® test plan—including Health Promotion and Maintenance, Physiological Integrity, Psychosocial Integrity, and Safe and Effective Care Environment. This completely redesigned second edition also features new alternate item formats, test-taking tips and test-taking traps covering helpful test taking strategies and techniques, and a rationales booklet that provides justification for correct answers.

All products in the Saunders Pyramid to Success can be obtained online by visiting <http://elsevierhealth.com> or by calling 800-545-2522.

Let's begin our journey through the Pyramid to Success.

Examination Process

An important step in the Pyramid to Success is to become as familiar as possible with the examination process. Candidates facing the challenge of this examination can experience significant anxiety. Knowing what the examination is all about and knowing what you will encounter during the process of testing will assist in alleviating fear and anxiety. The information contained in this chapter was obtained from the NCSBN Web site

(<http://www.ncsbn.org>) and from the NCSBN 2016 test plan for the NCLEX-RN and includes some procedures related to registering for the exam, testing procedures, and the answers to the questions most commonly asked by nursing students and graduates preparing to take the NCLEX. You can obtain additional information regarding the test and its development by accessing the NCSBN Web site and clicking on the NCLEX Exam tab or by writing to the National Council of State Boards of Nursing, 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. You are encouraged to access the NCSBN Web site because this site provides you with valuable information about the NCLEX and other resources available to an NCLEX candidate.

Computer Adaptive Testing

The acronym CAT stands for computer adaptive test, which means that the examination is created as the test-taker answers each question. All the test questions are categorized on the basis of the test plan structure and the level of difficulty of the question. As you answer a question, the computer determines your competency based on the answer you selected. If you selected a correct answer, the computer scans the question bank and selects a more difficult question. If you selected an incorrect answer, the computer scans the question bank and selects an easier question. This process continues until all test plan requirements are met and a reliable pass-or-fail decision is made.

When taking a CAT, once an answer is recorded, all subsequent questions administered depend, to an extent, on the answer selected for that question. Skipping and returning to earlier questions are not compatible with the logical methodology of a CAT. The inability to skip questions or go back to change previous answers will not be a disadvantage to you; you will not fall into that “trap” of changing a correct answer to an incorrect one with the CAT system.

If you are faced with a question that contains unfamiliar content, you may need to guess at the answer. There is no penalty for guessing but you need to make an educated guess. With most of the questions, the answer will be right there in front of you. If you need to guess, use your nursing knowledge and clinical experiences to their fullest extent and all of the test-taking strategies you have practiced in this review program.

You do not need any computer experience to take this examination. A keyboard tutorial is provided and administered to all test-takers at the start of the examination. The tutorial will instruct you on the use of the on-screen optional calculator, the use of the mouse, and how to record an answer. The tutorial provides instructions on how to respond to all question types on this examination. This tutorial is provided on the NCSBN Web site, and you are encouraged to view the tutorial

when you are preparing for the NCLEX examination. In addition, at the testing site, a test administrator is present to assist in explaining the use of the computer to ensure your full understanding of how to proceed.

Development of the Test Plan

The test plan for the NCLEX-RN examination is developed by the NCSBN. The examination is a national examination; the NCSBN considers the legal scope of nursing practice as governed by state laws and regulations, including the Nurse Practice Act, and uses these laws to define the areas on the examination that will assess the competence of the test-taker for licensure.

The NCSBN also conducts an important study every 3 years, known as a practice analysis study, to determine the framework for the test plan for the examination. The participants in this study include newly licensed registered nurses from all types of basic nursing education programs. From a list of nursing care activities provided, the participants are asked about the frequency and importance of performing them in relation to client safety and the setting in which they are performed. A panel of content experts at the NCSBN analyzes the results of the study and makes decisions regarding the test plan framework. The results of this recently conducted study provided the structure for the test plan implemented in April 2016.

Test Plan

The content of the NCLEX-RN examination reflects the activities identified in the practice analysis study conducted by the NCSBN. The questions are written to address Level of Cognitive Ability, Client Needs, and Integrated Processes as identified in the test plan developed by the NCSBN.

Level of Cognitive Ability

Levels of cognitive ability include knowledge, understanding, applying, analyzing, synthesizing, evaluating, and creating. The practice of nursing requires complex thought processing and critical thinking in decision making. Therefore, you will not encounter any knowledge or understanding questions on the NCLEX. Questions on this examination are written at the applying level or at higher Levels of Cognitive Ability. [Box 1-1](#) presents an example of a question that requires you to apply data.

Client Needs

The NCSBN identifies a test plan framework based on Client Needs, which includes 4 major categories. Some of these categories are divided further into subcategories. The Client Needs categories are Safe and Effective Care Environment, Health Promotion and Maintenance,

BOX 1-1 Level of Cognitive Ability: Applying

The nurse notes blanching, coolness, and edema at the peripheral intravenous (IV) site. On the basis of these findings, the nurse should implement which action?

1. Remove the IV.
2. Apply a warm compress.
3. Check for a blood return.
4. Measure the area of infiltration.

Answer: 1

This question requires that you focus on the data in the question and determine that the client is experiencing an infiltration. Next, you need to consider the harmful effects of infiltration and determine the action to implement. Because infiltration can be damaging to the surrounding tissue, the appropriate action is to remove the IV to prevent any further damage.

TABLE 1-1 Client Needs Categories and Percentage of Questions on the NCLEX-RN Examination

Client Needs Category	Percentage of Questions
Safe and Effective Care Environment	
Management of Care	17-23
Safety and Infection Control	9-15
Health Promotion and Maintenance	6-12
Psychosocial Integrity	6-12
Physiological Integrity	
Basic Care and Comfort	6-12
Pharmacological and Parenteral Therapies	12-18
Reduction of Risk Potential	9-15
Physiological Adaptation	11-17

Psychosocial Integrity, and Physiological Integrity ([Table 1-1](#)).

Safe and Effective Care Environment

The Safe and Effective Care Environment category includes 2 subcategories: Management of Care, and Safety and Infection Control. According to the NCSBN, Management of Care (17% to 23% of questions) addresses prioritizing content and content that will ensure a safe care delivery setting to protect clients, families, significant others, visitors, and health care personnel. The NCSBN indicates that Safety and Infection Control (9% to 15% of questions) addresses content that will protect clients, families, significant others, visitors, and health care personnel from health and environmental hazards within health care facilities and in community settings. [Box 1-2](#) presents examples of questions that address these 2 subcategories.

BOX 1-2 Safe and Effective Care Environment**Management of Care**

The nurse has received the client assignment for the day. Which client should the nurse assess first?

1. The client who needs to receive subcutaneous insulin before breakfast
2. The client who has a nasogastric tube attached to intermittent suction
3. The client who is 2 days postoperative and is complaining of incisional pain
4. The client who has a blood glucose level of 50 mg/dL (2.8 mmol/L) and complaints of blurred vision

Answer: 4

This question addresses the subcategory Management of Care in the Client Needs category Safe and Effective Care Environment. Note the **strategic word**, first, so you need to establish priorities by comparing the needs of each client and deciding which need is urgent. The client described in the correct option has a low blood glucose level and symptoms reflective of hypoglycemia. This client should be assessed first so that treatment can be implemented. Although the clients in options 1, 2, and 3 have needs that require assessment, their assessments can wait until the client in the correct option is stabilized.

Safety and Infection Control

The nurse prepares to care for a client on contact precautions who has a hospital-acquired infection caused by methicillin-resistant *Staphylococcus aureus* (MRSA). The client has an abdominal wound that requires irrigation and has a tracheostomy attached to a mechanical ventilator, which requires frequent suctioning. The nurse should assemble which necessary protective items before entering the client's room?

1. Gloves and gown
2. Gloves and face shield
3. Gloves, gown, and face shield
4. Gloves, gown, and shoe protectors

Answer: 3

This question addresses the subcategory Safety and Infection Control in the Client Needs category Safe and Effective Care Environment. It addresses content related to protecting oneself from contracting an infection and requires that you consider the methods of possible transmission of infection, based on the client's condition. Because splashes of infective material can occur during the wound irrigation or suctioning of the tracheostomy, option 3 is correct.

Health Promotion and Maintenance

The Health Promotion and Maintenance category (6% to 12% of questions) addresses the principles related to growth and development. According to the NCSBN, this Client Needs category also addresses content required to assist the client, family members, and significant others to prevent health problems; to recognize alterations in health; and to develop health practices that promote and support wellness. See **Box 1-3** for an example of a question in this Client Needs category.

BOX 1-3 Health Promotion and Maintenance

The nurse is choosing age-appropriate toys for a toddler. Which toy is the best choice for this age?

1. Puzzle
2. Toy soldiers
3. Large stacking blocks
4. A card game with large pictures

Answer: 3

This question addresses the Client Needs category Health Promotion and Maintenance and specifically relates to the principles of growth and development of a toddler. Note the **strategic word**, best. Toddlers like to master activities independently, such as stacking blocks. Because toddlers do not have the developmental ability to determine what could be harmful, toys that are safe need to be provided. A puzzle and toy soldiers provide objects that can be placed in the mouth and may be harmful for a toddler. A card game with large pictures may require cooperative play, which is more appropriate for a school-age child.

Psychosocial Integrity

The Psychosocial Integrity category (6% to 12% of questions) addresses content required to promote and support the ability of the client, client's family, and client's significant other to cope, adapt, and problem-solve during stressful events. The NCSBN also indicates that this Client Needs category addresses the emotional, mental, and social well-being of the client, family, or significant other, and care for the client with an acute or chronic mental illness. See **Box 1-4** for an example of a question in this Client Needs category.

Physiological Integrity

The Physiological Integrity category includes 4 subcategories: Basic Care and Comfort, Pharmacological and Parenteral Therapies, Reduction of Risk Potential, and

BOX 1-4 Psychosocial Integrity

A client with coronary artery disease has selected guided imagery to help cope with psychological stress. Which client statement indicates an understanding of this stress reduction measure?

1. "This will help only if I play music at the same time."
2. "This will work for me only if I am alone in a quiet area."
3. "I need to do this only when I lie down in case I fall asleep."
4. "The best thing about this is that I can use it anywhere, anytime."

Answer: 4

This question addresses the Client Needs category Psychosocial Integrity and the content addresses coping mechanisms. Guided imagery involves the client creating an image in the mind, concentrating on the image, and gradually becoming less aware of the offending stimulus. It can be done anytime and anywhere; some clients may use other relaxation techniques or play music with it.

Physiological Adaptation. The NCSBN describes these subcategories as follows. Basic Care and Comfort (6% to 12% of questions) addresses content for providing comfort and assistance to the client in the performance of activities of daily living. Pharmacological and Parenteral Therapies (12% to 18% of questions) addresses content for administering medications and parenteral therapies such as intravenous therapies and parenteral nutrition, and administering blood and blood products. Reduction of Risk Potential (9% to 15% of questions) addresses content for preventing complications or health problems related to the client's condition or

any prescribed treatments or procedures. Physiological Adaptation (11% to 17% of questions) addresses content for providing care to clients with acute, chronic, or life-threatening conditions. See [Box 1-5](#) for examples of questions in this Client Needs category.

Integrated Processes

The NCSBN identifies 5 processes in the test plan that are fundamental to the practice of nursing. These processes are incorporated throughout the major categories of Client Needs. The Integrated Process subcategories are Caring, Communication and Documentation, Nursing

BOX 1-5 Physiological Integrity

Basic Care and Comfort

A client with Parkinson's disease develops akinesia while ambulating, increasing the risk for falls. Which suggestion should the nurse provide to the client to alleviate this problem?

1. Use a wheelchair to move around.
2. Stand erect and use a cane to ambulate.
3. Keep the feet close together while ambulating and use a walker.
4. Consciously think about walking over imaginary lines on the floor.

Answer: 4

This question addresses the subcategory Basic Care and Comfort in the Client Needs category Physiological Integrity, and addresses client mobility and promoting assistance in an activity of daily living to maintain safety. Clients with Parkinson's disease can develop bradykinesia (slow movement) or akinesia (freezing or no movement). Having these clients imagine lines on the floor to walk over can keep them moving forward while remaining safe.

Pharmacological and Parenteral Therapies

The nurse monitors a client receiving digoxin for which early manifestation of digoxin toxicity?

1. Anorexia
2. Facial pain
3. Photophobia
4. Yellow color perception

Answer: 1

This question addresses the subcategory Pharmacological and Parenteral Therapies in the Client Needs category Physiological Integrity. Note the **strategic word**, early. Digoxin is a cardiac glycoside that is used to manage and treat heart failure and to control ventricular rates in clients with atrial fibrillation. The most common early manifestations of toxicity include gastrointestinal disturbances such as anorexia, nausea, and vomiting. Neurological abnormalities can also occur early and include fatigue, headache, depression, weakness, drowsiness, confusion, and nightmares. Facial pain, personality changes, and ocular disturbances (photophobia, diplopia, light flashes, halos around bright objects, yellow or green color perception) are also signs of toxicity, but are not early signs.

Reduction of Risk Potential

A magnetic resonance imaging (MRI) study is prescribed for a client with a suspected brain tumor. The nurse should implement which action to prepare the client for this test?

1. Shave the groin for insertion of a femoral catheter.
2. Remove all metal-containing objects from the client.
3. Keep the client NPO (nil per os; nothing by mouth) for 6 hours before the test.
4. Instruct the client in inhalation techniques for the administration of the radioisotope.

Answer: 2

This question addresses the subcategory Reduction of Risk Potential in the Client Needs category Physiological Integrity, and the nurse's responsibilities in preparing the client for the diagnostic test. In an MRI study, radiofrequency pulses in a magnetic field are converted into pictures. All metal objects, such as rings, bracelets, hairpins, and watches, should be removed. In addition, a history should be taken to ascertain whether the client has any internal metallic devices, such as orthopedic hardware, pacemakers, or shrapnel. NPO status is not necessary for an MRI study of the head. The groin may be shaved for an angiogram, and inhalation of the radioisotope may be prescribed with other types of scans but is not a part of the procedures for an MRI.

Physiological Adaptation

A client with renal insufficiency has a magnesium level of 3.5 mEq/L (1.75 mmol/L). On the basis of this laboratory result, the nurse interprets which sign as significant?

1. Hyperpnea
2. Drowsiness
3. Hypertension
4. Physical hyperactivity

Answer: 2

This question addresses the subcategory Physiological Adaptation in the Client Needs category Physiological Integrity. It addresses an alteration in body systems. The normal magnesium level is 1.5 to 2.5 mEq/L (0.75 to 1.25 mmol/L). A magnesium level of 3.5 mEq/L (1.75 mmol/L) indicates hypermagnesemia. Neurological manifestations begin to occur when magnesium levels are elevated and are noted as symptoms of neurological depression, such as drowsiness, sedation, lethargy, respiratory depression, muscle weakness, and areflexia. Bradycardia and hypotension also occur.

BOX 1-6 Integrated Processes

A client is scheduled for angioplasty. The client says to the nurse, “I’m so afraid that it will hurt and will make me worse off than I am.” Which response by the nurse is therapeutic?

1. “Can you tell me what you understand about the procedure?”
2. “Your fears are a sign that you really should have this procedure.”
3. “Those are very normal fears, but please be assured that everything will be okay.”
4. “Try not to worry. This is a well-known and easy procedure for the health care provider.”

Answer: 1

This question addresses the subcategory Caring in the category Integrated Processes. The correct option is a therapeutic communication technique that explores the client’s feelings, determines the level of client understanding about the procedure, and displays caring. Option 2 demeans the client and does not encourage further sharing by the client. Option 3 does not address the client’s fears, provides false reassurance, and puts the client’s feelings on hold. Option 4 diminishes the client’s feelings by directing attention away from the client and toward the health care provider’s importance.

Process (Assessment, Analysis, Planning, Implementation, and Evaluation), Culture and Spirituality, and Teaching and Learning. See [Box 1-6](#) for an example of a question that incorporates the Integrated Process of Caring.

Types of Questions on the Examination

The types of questions that may be administered on the examination include multiple-choice; fill-in-the-blank; multiple-response; ordered-response (also known as drag and drop); questions that contain a figure, chart/exhibit, or graphic option item; and audio or video item formats. Some questions may require you to use the mouse and cursor on the computer. For example, you may be presented with a picture that displays the arterial vessels of an adult client. In this picture, you may be asked to “point and click” (using the mouse) on the area (hot spot) where the dorsalis pedis pulse could be felt. In all types of questions, the answer is scored as either right or wrong. Credit is not given for a partially correct answer. In addition, all question types may include pictures, graphics, tables, charts, sound, or video. The NCSBN provides specific directions for you to follow with all question types to guide you in your process of testing. Be sure to read these directions as they appear on the computer screen. Examples of some of these types of questions are noted in this chapter. All question types are provided in this book and on the accompanying Evolve site.

Multiple-Choice Questions

Many of the questions that you will be asked to answer will be in the multiple-choice format. These questions

provide you with data about a client situation and 4 answers, or options.

Fill-in-the-Blank Questions

Fill-in-the-blank questions may ask you to perform a medication calculation, determine an intravenous flow rate, or calculate an intake or output record on a client. You will need to type only a number (your answer) in the answer box. If the question requires rounding the answer, this needs to be performed at the end of the calculation. The rules for rounding an answer are described in the tutorial provided by the NCSBN, and are also provided in the specific question on the computer screen. In addition, you must type in a decimal point if necessary. See [Box 1-7](#) for an example.

Multiple-Response Questions

For a multiple-response question, you will be asked to select or check all of the options, such as nursing interventions, that relate to the information in the question. In these question types, there may be 2 or more correct answers. No partial credit is given for correct selections. You need to do exactly as the question asks, which will be to select all of the options that apply. See [Box 1-8](#) for an example.

Ordered-Response Questions

In this type of question, you will be asked to use the computer mouse to drag and drop your nursing actions in order of priority. Information will be presented in a question and, based on the data, you need to determine what you will do first, second, third, and so forth. The unordered options will be located in boxes on the left side of the screen, and you need to move all options in order of priority to ordered-response boxes on the

BOX 1-7 Fill-in-the-Blank Question

A prescription reads: acetaminophen liquid, 650 mg orally every 4 hours PRN for pain. The medication label reads: 500 mg/15 mL. The nurse prepares how many milliliters to administer 1 dose? Fill in the blank. Record your answer using one decimal place.

Answer: 19.5 mL

Formula:

$$\frac{\text{Desired}}{\text{Available}} \hat{=} \text{volume } \frac{1}{4} \text{ mL}$$

$$\frac{650 \text{ mg}}{500 \text{ mg}} \hat{=} 15 \text{ mL } \frac{1}{4} 19.5 \text{ mL}$$

In this question, you need to use the formula for calculating a medication dose. When the dose is determined, you will need to type your numeric answer in the answer box. Always follow the specific directions noted on the computer screen. Also, remember that there will be an on-screen calculator on the computer for your use.

BOX 1-8 Multiple-Response Question

The emergency department nurse is caring for a child suspected of acute epiglottitis. Which interventions apply in the care of the child? Select all that apply.

- 1. Obtain a throat culture.
- 2. Ensure a patent airway.
- 3. Prepare the child for a chest x-ray.
- 4. Maintain the child in a supine position.
- 5. Obtain a pediatric-size tracheostomy tray.
- 6. Place the child on an oxygen saturation monitor.

In a multiple-response question, you will be asked to select or check all of the options, such as interventions, that relate to the information in the question. To answer this question, recall that acute epiglottitis is a serious obstructive inflammatory process that requires immediate intervention and that airway patency is a priority. Examination of the throat with a tongue depressor or attempting to obtain a throat culture is contraindicated because the examination can precipitate further obstruction. A lateral neck and chest x-ray is obtained to determine the degree of obstruction, if present. To reduce respiratory distress, the child should sit upright. The child is placed on an oxygen saturation monitor to monitor oxygenation status. Tracheostomy and intubation may be necessary if respiratory distress is severe. Remember to follow the specific directions given on the computer screen.

right side of the screen. Specific directions for moving the options are provided with the question. See [Figure 1-1](#) for an example. Examples of this question type are located on the accompanying Evolve site.

Figure Questions

A question with a picture or graphic will ask you to answer the question based on the picture or graphic. The question could contain a chart, a table, or a figure or illustration. You also may be asked to use the computer mouse to point and click on a specific area in the visual. A figure or illustration may appear in any type of question, including a multiple-choice question. See [Box 1-9](#) for an example.

Chart/Exhibit Questions

In this type of question, you will be presented with a problem and a chart or exhibit. You will be provided with 3 tabs or buttons that you need to click to obtain the information needed to answer the question. A prompt or message will appear that will indicate the need to click on a tab or button. See [Box 1-10](#) for an example.

Graphic Option Questions

In this type of question, the option selections will be pictures rather than text. Each option will be preceded by a circle, and you will need to use the computer mouse to click in the circle that represents your answer choice. See [Box 1-11](#) for an example.

Audio Questions

Audio questions will require listening to a sound to answer the question. These questions will prompt you to use the headset provided and to click on the sound icon. You will be able to click on the volume button to adjust the volume to your comfort level, and you will be able to listen to the

The screenshot shows the interface for a question in the Saunders Comprehensive Review for the NCLEX-RN Examination, 7th Edition. The question is titled "Question 1 of 42" and is in "Study Mode". The question text reads: "A client has a tracheostomy tube with a nondisposable inner cannula, and the nurse prepares to clean the tube. The nurse explains the procedure to the client, performs hand hygiene, and sets up a sterile field with appropriate equipment. **Arrange the actions in the order that they should be performed. All options must be used.**"

The actions to be ordered are listed in a left column:

- Dons sterile gloves and suctions the tracheostomy
- Documents the procedure and the client's response
- Dons sterile gloves, unlocks and removes the inner cannula
- Cleans the inner cannula, replaces it, and locks it into place
- Removes the dressing and discards it, and removes sterile gloves
- Cleans the tracheostomy site, changes the ties, and applies a dressing

On the right side, there are six numbered boxes (1 through 6) for the user to drag the actions into. The interface includes navigation buttons (Home, History, Study Mode, Calculator, Help, Bookmark, Stop) and a "Submit" button at the bottom.

FIGURE 1-1 Example of an ordered-response question.

BOX 1-9 Figure Question

A client who experienced a myocardial infarction is being monitored via cardiac telemetry. The nurse notes the sudden onset of this cardiac rhythm on the monitor (refer to figure) and immediately takes which action?

1. Takes the client's blood pressure
2. Initiates cardiopulmonary resuscitation (CPR)
3. Places a nitroglycerin tablet under the client's tongue
4. Continues to monitor the client and then contacts the health care provider (HCP)

Answer: 2

This question requires you to identify the cardiac rhythm, and then determine the priority nursing action. Note the **strategic word**, *immediately*. This cardiac rhythm identifies a coarse ventricular fibrillation (VF). The goals of treatment are to terminate VF promptly and to convert it to an organized rhythm. The HCP or an Advanced Cardiac Life Support (ACLS)-qualified nurse must immediately defibrillate the client. If a defibrillator is not readily available, CPR is initiated until the defibrillator arrives. Options 1, 3, and 4 are incorrect actions and delay life-saving treatment.

BOX 1-10 Chart/Exhibit Question

Client's Chart

History and physical	Medications	Diagnostic results
Item 1: Has renal calculi	Item 3: Multivitamin orally daily	Item 4: Electrocardiogram normal
Item 2: Had thrombophlebitis 1 year ago		

The nurse reviews the history and physical examination documented in the medical record of a client requesting a prescription for oral contraceptives. The nurse determines that oral contraceptives are contraindicated because of which documented item? Refer to chart.

Answer: 2

This chart/exhibit question provides you with data from the client's medical record and asks you to identify the item that is a contraindication to the use of oral contraceptives. Oral contraceptives are contraindicated in women with a history of any of the following: thrombophlebitis and thromboembolic disorders, cardiovascular or cerebrovascular diseases (including stroke), any estrogen-dependent cancer or breast cancer, benign or malignant liver tumors, impaired liver function, hypertension, and diabetes mellitus with vascular involvement. Adverse effects of oral contraceptives include increased risk of superficial and deep venous thrombosis, pulmonary embolism, thrombotic stroke (or other types of strokes), myocardial infarction, and accelerations of preexisting breast tumors.

sound as many times as necessary. Content examples include, but are not limited to, various lung sounds, heart sounds, or bowel sounds. Examples of this question type are located on the accompanying Evolve site (Fig. 1-2).

BOX 1-11 Graphic Options Question

The nurse should place the client in which position to administer an enema? (Refer to the figures in 1 to 4.)

- 1.
- 2.
- 3.
- 4.

Answer: 2

This question requires you to select the picture that represents your answer choice. To administer an enema, the nurse assists the client into the left side-lying (Sims') position with the right knee flexed. This position allows the enema solution to flow downward by gravity along the natural curve of the sigmoid colon and rectum, improving the retention of solution. Option 1 is a prone position. Option 3 is a dorsal recumbent position. Option 4 is a supine position.

Video Questions

Video questions will require viewing of an animation or video clip to answer the question. These questions will prompt you to click on the video icon. There may be sound associated with the animation and video, in which case you will be prompted to use the headset.

FIGURE 1-2 Example of an audio question.

Content examples include, but are not limited to, assessment techniques, nursing procedures, or communication skills. Examples of this question type are located on the accompanying Evolve site (Fig. 1-3).

Registering to Take the Examination

It is important to obtain an NCLEX Examination Candidate Bulletin from the NCSBN Web site at www.ncsbn.org because this bulletin provides all of the information you need to register for and schedule your examination. It also provides you with Web site and telephone information for NCLEX examination contacts. The initial step in the registration process is to submit an application to the state board of nursing in the state in which you intend to obtain licensure. You need to obtain information from the board of nursing regarding the specific registration process because the process may vary from state to state. Then, use the NCLEX Examination Candidate Bulletin as your guide to complete the registration process.

Following the registration instructions and completing the registration forms precisely and accurately are important. Registration forms not properly completed or not accompanied by the proper fees in the required method of payment will be returned to you and will delay testing. You must pay a fee for taking the examination; you also may have to pay additional fees to the board of nursing in the state in which you are applying.

Authorization to Test Form and Scheduling an Appointment

Once you are eligible to test, you will receive an Authorization to Test (ATT) form. You cannot make an appointment until you receive an ATT form. Note the validity dates on the ATT form, and schedule a testing date and time before the expiration date on the ATT form. The NCLEX Examination Candidate Bulletin provides you with the directions for scheduling an appointment and you do not have to take the examination in the same state in which you are seeking licensure.

The ATT form contains important information, including your test authorization number, candidate identification number, and validity date. You need to take your ATT form to the testing center on the day of your examination. You will not be admitted to the examination if you do not have it.

Changing Your Appointment

If for any reason you need to change your appointment to test, you can make the change on the candidate Web site or by calling candidate services. Refer to the NCLEX Examination Candidate Bulletin for this contact information and other important procedures for canceling and changing an appointment. If you fail to arrive for the examination

FIGURE 1-3 Example of a video question.

or fail to cancel your appointment to test without providing appropriate notice, you will forfeit your examination fee and your ATT form will be invalidated. This information will be reported to the board of nursing in the state in which you have applied for licensure, and you will be required to register and pay the testing fees again.

Day of the Examination

It is important that you arrive at the testing center at least 30 minutes before the test is scheduled. If you arrive late for the scheduled testing appointment, you may be required to forfeit your examination appointment. If it is necessary to forfeit your appointment, you will need to reregister for the examination and pay an additional fee. The board of nursing will be notified that you did not take the test. A few days before your scheduled date of testing, take the time to drive to the testing center to determine its exact location, the length of time required to arrive at that destination, and any potential obstacles that might delay you, such as road construction, traffic, or parking sites.

In addition to the ATT form, you must have proper identification (ID) such as a U.S. driver's license, passport, U.S. state ID, or U.S. military ID to be admitted to take the examination. All acceptable identification must be valid and not expired and contain a photograph and signature (in English). In addition, the first and last names on the ID must match the ATT form. According to the NCSBN guidelines, any name discrepancies require

legal documentation, such as a marriage license, divorce decree, or court action legal name change.

Testing Accommodations

If you require testing accommodations, you should contact the board of nursing before submitting a registration form. The board of nursing will provide the procedures for the request. The board of nursing must authorize testing accommodations. Following board of nursing approval, the NCSBN reviews the requested accommodations and must approve the request. If the request is approved, the candidate will be notified and provided the procedure for registering for and scheduling the examination.

Testing Center

The testing center is designed to ensure complete security of the testing process. Strict candidate identification requirements have been established. You will be asked to read the rules related to testing. A digital fingerprint and palm vein print will be taken. A digital signature and photograph will also be taken at the testing center. These identity confirmations will accompany the NCLEX exam results. In addition, if you leave the testing room for any reason, you may be required to perform these identity confirmation procedures again to be readmitted to the room.

Personal belongings are not allowed in the testing room; all electronic devices must be placed in a sealable

bag provided by the test administrator and kept in a locker. Any evidence of tampering with the bag could result in an incident and a result cancellation. A locker and locker key will be provided for you; however, storage space is limited, so you must plan accordingly. In addition, the testing center will not assume responsibility for your personal belongings. The testing waiting areas are generally small; friends or family members who accompany you are not permitted to wait in the testing center while you are taking the examination.

Once you have completed the admission process, the test administrator will escort you to the assigned computer. You will be seated at an individual workspace area that includes computer equipment, appropriate lighting, an erasable note board, and a marker. No items, including unauthorized scratch paper, are allowed into the testing room. Eating, drinking, or the use of tobacco is not allowed in the testing room. You will be observed at all times by the test administrator while taking the examination. In addition, video and audio recordings of all test sessions are made. The testing center has no control over the sounds made by typing on the computer by others. If these sounds are distracting, raise your hand to summon the test administrator. Earplugs are available on request.

You must follow the directions given by the testing center staff and must remain seated during the test except when authorized to leave. If you think that you have a problem with the computer, need a clean note board, need to take a break, or need the test administrator for any reason, you must raise your hand. You are also encouraged to access the NCSBN candidate Web site to obtain additional information about the physical environment of the testing center and to view a virtual tour of the testing center.

Testing Time

The maximum testing time is 6 hours; this period includes the tutorial, the sample items, all breaks, and the examination. All breaks are optional. The first optional break will be offered after 2 hours of testing. The second optional break is offered after 3.5 hours of testing. Remember that all breaks count against testing time. If you take a break, you must leave the testing room and, when you return, you may be required to perform identity confirmation procedures to be readmitted.

Length of the Examination

The minimum number of questions that you will need to answer is 75. Of these 75 questions, 60 will be operational (scored) questions and 15 will be pretest (unscored) questions. The maximum number of questions in the test is 265. Fifteen of the total number of questions that you need to answer will be pretest (unscored) questions.

The pretest questions are questions that may be presented as scored questions on future examinations.

These pretest questions are not identified as such. In other words, you do not know which questions are the pretest (unscored) questions; however, these pretest (unscored) questions will be administered among the first 75 questions in the test.

Pass-or-Fail Decisions

All examination questions are categorized by test plan area and level of difficulty. This is an important point to keep in mind when you consider how the computer makes a pass-or-fail decision because a pass-or-fail decision is not based on a percentage of correctly answered questions.

The NCSBN indicates that a pass-or-fail decision is governed by 3 different scenarios. The first scenario is the 95% Confidence Interval Rule, in which the computer stops administering test questions when it is 95% certain that the test-taker's ability is clearly above the passing standard or clearly below the passing standard. The second scenario is known as the Maximum-Length Exam, in which the final ability estimate of the test-taker is considered. If the final ability estimate is above the passing standard, the test-taker passes; if it is below the passing standard, the test-taker fails.

The third scenario is the Run-Out-Of-Time (R.O.O.T) Rule. If the examination ends because the test-taker ran out of time, the computer may not have enough information with 95% certainty to make a clear pass-or-fail decision. If this is the case, the computer will review the test-taker's performance during testing. If the test-taker has not answered the minimum number of required questions, the test-taker fails. If the test-taker's ability estimate was consistently above the passing standard on the last 60 questions, the test-taker passes. If the test-taker's ability estimate falls below the passing standard, even once, the test-taker fails. Additional information about pass-or-fail decisions can be found in the NCLEX Examination Candidate Bulletin located at www.ncsbn.org.

Completing the Examination

When the examination has ended, you will complete a brief computer-delivered questionnaire about your testing experience. After you complete this questionnaire, you need to raise your hand to summon the test administrator. The test administrator will collect and inventory all note boards and then permit you to leave.

Processing Results

Every computerized examination is scored twice, once by the computer at the testing center and again after the examination is transmitted to the test scoring center. No results are released at the testing center; testing center staff do not have access to examination results. The board of nursing receives your result and your result will

be mailed to you approximately 1 month after you take the examination. In some states, an unofficial result can be obtained via the Quick Results Service 2 business days after taking the examination. There is a fee for this service and information about obtaining your NCLEX result by this method can be obtained on the NCSBN Web site under candidate services.

Candidate Performance Report

A candidate performance report is provided to a test-taker who failed the examination. This report provides the test-taker with information about her or his strengths and weaknesses in relation to the test plan framework and provides a guide for studying and retaking the examination. If a retake is necessary, the candidate must wait 45 to 90 days between examination administration, depending on state procedures. Test-takers should refer to the state board of nursing in the state in which licensure is sought for procedures regarding when the examination can be taken again.

Interstate Endorsement

Because the NCLEX-RN examination is a national examination, you can apply to take the examination in any state. When licensure is received, you can apply for interstate endorsement, which is obtaining another license in another state to practice nursing in that state. The procedures and requirements for interstate endorsement may vary from state to state, and these procedures can be obtained from the state board of nursing in the state in which endorsement is sought.

Nurse Licensure Compact

It may be possible to practice nursing in another state under the mutual recognition model of nursing licensure if the state has enacted a Nurse Licensure Compact. To obtain information about the Nurse Licensure Compact and the states that are part of this interstate compact, access the NCSBN Web site at <http://www.ncsbn.org>.

The Foreign-Educated Nurse

An important first step in the process of obtaining information about becoming a registered nurse in the United States is to access the NCSBN Web site at <http://www.ncsbn.org> and obtain information provided for international nurses in the NCLEX Web site link. The NCSBN provides information about some of the documents you need to obtain as an international nurse seeking licensure in the United States and about credentialing agencies. Refer to [Box 1-12](#) for a listing of some of these

BOX 1-12 Foreign-Educated Nurse: Some Documents Needed to Obtain Licensure

1. Proof of citizenship or lawful alien status
2. Work visa
3. VisaScreen certificate
4. Commission on Graduates of Foreign Nursing Schools (CGFNS) certificate
5. Criminal background check documents
6. Official transcripts of educational credentials sent directly to credentialing agency or board of nursing from home country school of nursing
7. Validation of a comparable nursing education as that provided in U.S. nursing programs; this may include theoretical instruction and clinical practice in a variety of nursing areas, including, but not limited to, medical nursing, surgical nursing, pediatric nursing, maternity and newborn nursing, community and public health nursing, and mental health nursing
8. Validation of safe professional nursing practice in home country
9. Copy of nursing license or diploma or both
10. Proof of proficiency in the English language
11. Photograph(s)
12. Social Security number
13. Application and fees

documents. The NCSBN also provides information regarding the requirements for education and English proficiency, and immigration requirements such as visas and VisaScreen. You are encouraged to access the NCSBN Web site to obtain the most current information about seeking licensure as a registered nurse in the United States.

An important factor to consider as you pursue this process is that some requirements may vary from state to state. You need to contact the board of nursing in the state in which you are planning to obtain licensure to determine the specific requirements and documents that you need to submit.

Boards of nursing can decide either to use a credentialing agency to evaluate your documents or to review your documents at the specific state board, known as in-house evaluation. When you contact the board of nursing in the state in which you intend to work as a nurse, inform them that you were educated outside of the United States and ask that they send you an application to apply for licensure by examination. Be sure to specify that you are applying for registered nurse (RN) licensure. You should also ask about the specific documents needed to become eligible to take the NCLEX exam. You can obtain contact information for each state board of nursing through the NCSBN Web site at <http://www.ncsbn.org>. In addition, you can write to the NCSBN regarding the NCLEX exam. The address is 111 East Wacker Drive, Suite 2900, Chicago, IL 60601. The telephone number for the NCSBN is 1-866-293-9600; international telephone is 011 1 312 525 3600; the fax number is 1-312-279-1032.

Pathways to Success

Laurent W. Valliere, BS, DD

The Pyramid to Success

Preparing to take the NCLEX-RN[®] examination can produce a great deal of anxiety. You may be thinking that this exam is the most important one you will ever have to take and that it reflects the culmination of everything you have worked so hard for. This is an important examination because receiving your nursing license means that you can begin your career as a registered nurse. Your success on this exam involves getting rid of all thoughts that allow this examination to appear overwhelming and intimidating. Such thoughts can take complete control over your destiny. A strong positive attitude, a structured plan for preparation, and maintaining control in your pathway to success ensure reaching the peak of the Pyramid to Success (Fig. 2-1).

Pathways to Success (Box 2-1)

Foundation

The foundation of pathways to success begins with a strong positive attitude, the belief that you will achieve success, and developing control. It also includes developing a list of your personal short-term and long-term goals and a plan for preparation. Without these components, your pathway to success leads to nowhere and has no endpoint. You will expend energy and valuable time in your journey, lack control over where you are heading, and experience exhaustion without any accomplishment.

Where do you start? To begin, find a location that offers solitude. Sit or lie in a comfortable position, close your eyes, relax, inhale deeply, hold your breath to a count of 4, exhale slowly, and, again, relax. Repeat this breathing exercise several times until you feel relaxed, free from anxiety, and in control of your destiny. Allow your mind to become void of all mind chatter; now you are in control and your mind's eye can see for miles. Next, reflect on all that you have accomplished and the path that brought you to where you are today. Keep a journal of your reflections as you plan the order of your journey through the Pyramid to Success.

List

It is time to create the “List.” The List is your set of short-term and long-term goals. Begin by developing the goals that you wish to accomplish today, tomorrow, over the next month, and in the future. Allow yourself the opportunity to list all that is flowing from your mind. Write your goals in your personal journal. When the List is complete, put it away for 2 or 3 days. After that time, retrieve and review the List and begin the process of planning to prepare for the NCLEX-RN exam.

Plan for Preparation

Now that you have the List in order, look at the goals that relate to studying for the licensing exam. The first task is to decide what study pattern works best for you. Think about what has worked most successfully for you in the past. Questions that must be addressed to develop your plan for study are listed in Box 2-2.

The plan must include a schedule. Use a calendar to plan and document the daily times and nursing content areas for your study sessions. Establish a realistic schedule that includes your daily, weekly, and future goals, and stick to your plan of study. This consistency will provide advantages to you and the people supporting you. You will develop a rhythm that can enhance your retention and positive momentum. The people who are supporting you will share this rhythm and be able to schedule their activities and lives better when you are consistent with your study schedule.

The length of the study session depends on your ability to focus and concentrate. You need to think about quality rather than quantity when you are deciding on a realistic amount of time for each session. Plan to schedule at least 2 hours of quality study time daily. If you can spend more than 2 hours, by all means do so.

You may ask, “What do you mean by quality study time?” Quality study time means spending uninterrupted quiet time at your study session. This may mean that you have to isolate yourself for these study sessions. Think again about what has worked for you during nursing school when you studied for examinations; select a study place that has worked for you in the past. If you

FIGURE 2-1 Pyramid to Success.

BOX 2-1 Pathways to Success**Foundation**

Maintaining a strong positive attitude
 Thinking about short-term and long-term realistic goals
 Developing a plan for preparation
 Maintaining control

List

Writing short-term and long-term realistic goals in a journal

Plan for Preparation

Developing a study plan and schedule
 Deciding on the place to study
 Balancing personal and work obligations with the study schedule
 Sharing the study schedule and personal needs with others
 Implementing the study plan

Positive Pampering

Planning time for exercise and fun activities
 Establishing healthy eating habits
 Including activities in the schedule that provide positive mental stimulation

Final Preparation

Reviewing and identifying goals achieved
 Remaining focused to complete the plan of study
 Writing down the date and time of the examination and posting it next to your name with the letters “RN” following, and the word “YES!”
 Planning a test drive to the testing center
 Engaging in relaxing activities on the day before the examination

Day of the Examination

Grooming yourself for success
 Eating a nutritious breakfast
 Maintaining a confident and positive attitude
 Maintaining control—breathe and focus
 Meeting the challenges of the day
 Reaching the peak of the Pyramid to Success

BOX 2-2 Developing a Plan for Study

Do I work better alone or in a study group?
 If I work best in a group, how many study partners should I have?
 Who are these study partners?
 How long should my study sessions last?
 Does the time of day that I study make a difference?
 Do I retain more if I study in the morning?
 How does my work schedule affect my study pattern?
 How do I balance my family obligations with my need to study?
 Do I have a comfortable study area at home or should I find another environment that is conducive to my study needs?

have a special study room at home that you have always used, plan your study sessions in that special room. If you have always studied at a library, plan your study sessions at the library. Sometimes it is difficult to balance your study time with your family obligations and possibly a work schedule, but, if you can, plan your study time when you know that you will be at home alone. Try to eliminate anything that may be distracting during your study time. Silence your cellphone appropriately so that you will not be disturbed. If you have small children, plan your study time during their nap time or during their school hours.

Your plan must include how you will manage your study needs with your other obligations. Your family and friends are key players in your life and are going to become part of your Pyramid to Success. After you have established your study needs, communicate your needs and the importance of your study plan to your family and friends.

A difficult part of the plan may be how to deal with family members and friends who choose not to participate in your plan for success. For example, what do you do if a friend asks you to go to a movie and it is your scheduled study time? Your friend may say, “Take some time off. You have plenty of time to study. Study later when we get back!” You are faced with a decision. You must weigh all factors carefully. You must keep your goals in mind and remember that your need for positive momentum is critical. Your decision may not be an easy one, but it must be one that will ensure that your goal of becoming a registered nurse is achieved.

Positive Pampering

Positive pampering means that you must continue to care for yourself holistically. Positive momentum can be maintained only if you are properly balanced. Proper exercise, diet, and positive mental stimulation are crucial to achieving your goal of becoming a registered nurse. Just as you have developed a schedule for study, you should have a schedule that includes fun and physical

activity. It is your choice—aerobics, walking, weight lifting, bowling, or whatever makes you feel good about yourself. Time spent away from the hard study schedule and devoted to some fun and physical exercise pays you back a hundredfold. You will be more energetic with a schedule that includes these activities.

Establish healthy eating habits. Be sure to drink plenty of water, which will flush and clean your body cells. Stay away from fatty foods because they slow you down. Eat lighter meals and eat more frequently. Include complex carbohydrates such as oatmeal or whole grain foods in your diet for energy, and be careful not to include too much caffeine in your daily diet.

Take the time to pamper yourself with activities that make you feel even better about who you are. Make dinner reservations at your favorite restaurant with someone who is special and is supporting your goal. Take walks in a place that has a particular tranquility that enables you to reflect on the positive momentum that you have achieved and maintained. Whatever it is, wherever it takes you, allow yourself the time to do some positive pampering.

Final Preparation

You have established the foundation of your Pyramid to Success. You have developed your list of goals and your study plan, and you have maintained your positive momentum. You are moving forward, and in control. When you receive your date and time for the NCLEX-RN examination, you may immediately think, “I am not ready!” Stop! Reflect on all you have achieved. Think about your goal achievement and the organization of the positive life momentum with which you have surrounded yourself. Think about all of the people who love and support your effort to become a registered nurse. Believe that the challenge that awaits you is one that you have successfully prepared for and will lead you to your goal of becoming a registered nurse.

Take a deep breath and organize the remaining days so that they support your educational and personal needs. Support your positive momentum with a visual technique. Write your name in large letters, and write the letters “RN” after it. Post 1 or more of these visual reinforcements in areas that you frequent. This is a visual motivational technique that works for many nursing graduates preparing for this examination.

It is imperative that you not fall into the trap of expecting too much of yourself. The idea of perfection must not drive you to a point that causes your positive momentum to falter. You must believe and stay focused on your goal. The date and time are at hand. Write the date and time, and underneath write the word “YES!” Post this next to your name plus “RN.”

Ensure that you have command over how to get to the testing center. A test run is a must. Time the drive,

and allow for road construction or whatever might occur to slow traffic down. On the test run, when you arrive at the test facility, walk into it and become familiar with the lobby and the surroundings. This may help to alleviate some of the peripheral nervousness associated with entering an unknown building. Remember that you must do whatever it takes to keep yourself in control. If familiarizing yourself with the facility will help you to maintain positive momentum, by all means be sure to do so.

It is time to check your study plan and make the necessary adjustments now that a firm date and time are set. Adjust your review so that your study plan ends 2 days before the examination. The mind is like a muscle. If it is overworked, it has no strength or stamina. Your strategy is to rest the body and mind on the day before the examination. Your strategy is to stay in control and allow yourself the opportunity to be absolutely fresh and attentive on the day of the examination. This will help you to control the nervousness that is natural, achieve the clear thought processes required, and feel confident that you have done all that is necessary to prepare for and conquer this challenge. The day before the examination is to be one of pleasure. Treat yourself to what you enjoy the most.

Relax! Take a deep breath, hold to a count of 4, and exhale slowly. You have prepared yourself well for the challenge of tomorrow. Allow yourself a restful night’s sleep, and wake up on the day of the examination knowing that you are absolutely prepared to succeed. Look at your name with “RN” after it and the word “YES!”

Day of the Examination (Box 2-3)

Wake up believing in yourself and that all you have accomplished is about to propel you to the professional level of registered nurse. Allow yourself plenty of time, eat a nutritious breakfast, and groom yourself for success. You are ready to meet the challenges of the day and overcome any obstacle that may face you. Today will soon be history, and tomorrow will bring you the envelope on which you read your name with the words “Registered Nurse” after it.

Be proud and confident of your achievements. You have worked hard to achieve your goal of becoming a

BOX 2-3 Day of the Examination

Breathe: Inhale deeply, hold your breath to a count of 4, exhale slowly

Believe: Have positive thoughts today and keep those thoughts focused on your achievements

Control: You are in command

Believe: This is your day

Visualize: “RN” with your name

registered nurse. If you believe in yourself and your goals, no one person or obstacle can move you off the pathway that leads to success! Congratulations, and I wish you the very best in your career as a registered nurse!

This Is Not a Test

1. What are the factors needed to ensure a productive study environment? Select all that apply.
 1. Secure a location that offers solitude.
 2. Plan breaks during your study session.
 3. Establish a realistic study schedule that includes your goals.
 4. Continue with the study pattern that has worked best for you.

Answers: 1, 2, 3, 4

Rationale: A location of solitude helps to ensure concentration. Taking breaks during your study session helps to clear your mind and increase your ability to concentrate and focus. Establishing a realistic study pattern will keep you in control. Do not vary your study pattern. It has been successful for you, so why change now?

2. What are key factors in your final preparation? Select all that apply.
 1. Remain focused on the study plan.
 2. Visualize the “RN” after your name.
 3. Avoid studying on the day before the exam and relax.
 4. Know where the testing center is and how long it takes to get there.

Answers: 1, 2, 3, 4

Rationale: Focus on your plan of study and success will follow. Positive reinforcement: Write your name in large letters on a piece of paper with “RN” after your name and post it where you will see it often. Allow yourself a day of pampering before the test. Wake up on the day of the test refreshed and ready to succeed. Ensure that you know where the testing center is; map out your route and the average time it takes to arrive.

3. What key points do the “Pathways to Success” emphasize to help ensure your success? Select all that apply.
 1. A strong positive attitude
 2. Believing in your ability to succeed
 3. Being proud and confident in your achievements
 4. Maintaining control of your mind, surrounding environment, and physical being

Answers: 1, 2, 3, 4

Rationale: A strong positive attitude leads to success. Believe in who you are and the goals you have set for yourself. Be “proud and confident.” If you believe in yourself, you will achieve success. Maintain control and all of your goals are attainable.

Your grade: A+

Continue to “Believe” and you will succeed.

RN belongs to you!

The NCLEX-RN[®] Examination from a Graduate's Perspective

Jaskaranjeet “Jessica” Bhullar, BSN, RN

Graduating from nursing school is a huge accomplishment. After earning my Bachelor of Science in Nursing (BSN), I reflected on all of the work that had led to that moment. The past 16 months had been a whirlwind. Memories of preparing for simulations and late nights studying for exams and completing detailed care plans flooded my mind. Though I was done with school, I knew there was one more test I would have to pass before I could call myself a registered nurse. The NCLEX[®] is a national licensing exam that is administered to every nursing school graduate. Passing this exam gives graduates a license to practice. I knew it would be the most important exam of my life and I was determined to pass it.

In addition to studying, a few things must be done in preparation for the NCLEX. Approximately 1 month before I graduated, I submitted the required paperwork and fees to my State Board of Nursing. It is important to do this well in advance, as it can potentially take months for your state board to process the paperwork. Your school will notify the board once your degree is confirmed. Then it is a matter of waiting for your Authorization to Test (ATT). An ATT enables you to schedule your test date. Since I had done everything on my part to ensure that there would be no delays, I expected to receive my ATT within a few weeks after graduation. While I waited, I packed up my apartment and moved from Nevada to my home state of California. I also spent some time catching up with friends I had not seen in months. Within a few days of arriving home, I received my ATT. I wanted to take the exam as soon as possible, so I expanded my search for testing centers to neighboring cities. I did not mind driving a bit farther if it meant that I could take the exam sooner. I found that the earliest available test date was 3 weeks later in a city about 45 minutes away. The only available time was 2:00 p.m., which I gladly accepted as it meant I could get a good night's rest and avoid early morning traffic. I felt that I had a solid knowledge base from school, and 3 weeks would be more than enough time to review concepts and

practice more questions. You will need to assess your personal knowledge level and confidence to gauge how much time you require to study. It is recommended to take the exam within a maximum of 3 months to ensure that you are not losing the knowledge you learned while in school.

Now that I had a date marked in my calendar, I felt empowered to create a study plan. I chose to use 1 or 2 resources at the most in order to stay focused and master content realistically. Based on my research, I chose Saunders Comprehensive Review for the NCLEX-RN[®] Examination. I used this text in nursing school and knew it would benefit me during my NCLEX preparation. Be thoughtful and selective when choosing study tools and find what works best for you. What works for some people may not work for others. I set a goal to practice 150 to 200 questions a day. The NCLEX can ask as few as 75 questions and as many as 265. I wanted to build up my test-taking endurance, which is why I chose to practice so many questions. When I answered questions, I would read the entire rationales regardless of whether I answered correctly or not. A wealth of information is included in each rationale. You will gain a better understanding of not only content, but also why you selected an incorrect or correct answer. It is also important to read the Test-Taking Strategy, because this will provide you with a logical way of answering the question if you were not as confident in your mastery of the material as you would have liked. I prefer to study alone, and I spent most days practicing questions at home or in a nearby cafe. I made sure to take a break every hour to stretch and refresh my mind. Knowing that I had only a few weeks to study made me use my time more wisely. I knew it was only a matter of time before I would be done with the NCLEX, and I wanted to feel as if I had done everything I could to pass the exam.

If there is anything you can do to alleviate test anxiety, do it! Two days before the exam, I drove to the testing center. I left my house around the same time I planned to leave on the actual test day, so I could see

what traffic would be like and the parking availability. I found a market nearby where I planned to have lunch before taking the exam. Simply doing this dry run helped to calm my nerves. I could visualize what my test day would look like. The day before the NCLEX, I chose to relax my mind, so I didn't practice any questions. I made sure to put my ATT and identification (ID) aside because they are required at check-in and I didn't want to forget them. I spent the day with my family and went to bed early. Keep in mind that the exam can take as long as 6 hours, so adequate sleep is a must!

On the day of the NCLEX, I left my house a few hours early so I would have a chance to eat lunch and practice a few questions, just to get into test-taking mode. I believe that a positive mental attitude is important in life and especially in potentially stressful situations. I knew that in a matter of hours, the exam would be over. It does not matter at what question number your computer turns off, but rather that you answered each question thoughtfully and to the best of your ability. I arrived at the testing center 30 minutes early. I was aware that lockers are provided, but I brought as little as possible with me. The check-in process involves showing your ATT and ID, having your fingers and palms scanned, and having your photo taken. You will also be given a form with instructions about the exam, which you will be required to sign. It is all very straightforward. I was directed to a computer

in the testing room. I took a deep breath and began the exam. I treated each question as if it was the last one I had to answer. Before I knew it, I was on question number 75 and I clicked submit. The computer shut down and I felt a wave of relief. I was done with the NCLEX!

I left the testing center feeling confident. The questions had become difficult very quickly, and I took that as an indication that I was doing well. I replayed the questions in my mind on the drive home, and began to dwell on a couple I had been unsure about. I didn't allow myself to become consumed by self-doubt because the exam was over and there was nothing I could do but wait! A couple of days later, I found out I was officially a registered nurse! My lifelong dream was now a reality. I had worked so hard for this, and felt that now I could celebrate with my friends and family.

The NCLEX is the last hurdle you will have to jump over before you begin your professional career. It may be tempting to put off taking the test until you feel 100% prepared, but the longer you wait the more likely it is that you will forget content you learned during school. Believe in yourself and your education! Use your time wisely and reduce anxiety however you can. I hope these suggestions will benefit you. Congratulations for all you have and will accomplish, and the best of luck in your new career!

Test-Taking Strategies

If you would like to read more about test-taking strategies after completing this chapter, Saunders Strategies for Test Success: Passing Nursing School and the NCLEX[®] Exam focuses on the test-taking strategies that will help you to pass your nursing examinations while in nursing school and will prepare you for the NCLEX-RN[®] examination.

I. Key Test-Taking Strategies (Box 4-1)

II. How to Avoid Reading into the Question (Box 4-2)

A. Pyramid Points

1. Avoid asking yourself the forbidden words, “Well, what if...?” because this will lead you to the “forbidden” area: reading into the question.
2. Focus only on the data in the question, read every word, and make a decision about what the question is asking. Reread the question more than 1 time; ask yourself, “What is this question asking?” and “What content is this question testing?” (see Box 4-2).
3. Look for the strategic words in the question, such as immediate, initial, first, priority, initial, best, need for follow-up, or need for further teaching; strategic words make a difference regarding what the question is asking.
4. In multiple-choice questions, multiple-response questions, or questions that require you to arrange nursing interventions or other data in order of priority, read every choice or option presented before answering.
5. Always use the process of elimination when choices or options are presented; after you have eliminated options, reread the question before selecting your final choice or choices. Focus on the data in both the question and the options to assist in the process of elimination and directing you to the correct answer (see Box 4-2).
6. With questions that require you to fill in the blank, focus on the data in the question and determine what the question is asking; if the question requires you to calculate a medication dose, an intravenous flow rate, or intake and output amounts, recheck your work in calculating

and always use the on-screen calculator to verify the answer.

B. Ingredients of a question (Box 4-3)

1. The ingredients of a question include the event, which is a client or clinical situation; the event query; and the options or answers.
2. The event provides you with the content about the client or clinical situation that you need to think about when answering the question.
3. The event query asks something specific about the content of the event.
4. The options are all of the answers provided with the question.
5. In a multiple-choice question, there will be 4 options and you must select one; read every option carefully and think about the event and the event query as you use the process of elimination.
6. In a multiple-response question, there will be several options and you must select all options that apply to the event in the question. Each option provided is a true or false statement; choose the true statements. Also, visualize the event and use your nursing knowledge and clinical experiences to answer the question.
7. In an ordered-response (prioritizing)/drag-and-drop question, you will be required to arrange in order of priority nursing interventions or other data; visualize the event and use your nursing knowledge and clinical experiences to answer the question.
8. A fill-in-the-blank question will not contain options, and some figure/illustration questions and audio or video item formats may or may not contain options. A graphic option item will contain options in the form of a picture or graphic.
9. A chart/exhibit question will most likely contain options; read the question carefully and all of the information in the chart or exhibit before selecting an answer. In this question type, there will be information that is pertinent to how the question is answered, and there may also be information that is not pertinent. It is necessary to discern what information is important and what the “distractors” are.

BOX 4-1 Key Test-Taking Strategies

- The Question
 - Focus on the data, read every word, and make a decision about what the question is asking.
 - Note the subject and determine what content is being tested.
 - Visualize the event; note if an abnormality exists in the data provided.
 - Look for the strategic words; strategic words make a difference regarding what the question is asking about.
 - Determine if the question presents a positive or negative event query.
 - Avoid asking yourself, “Well, what if...?” because this will lead you to reading into the question.
- The Options
 - Always use the process of elimination when choices or options are presented and always read each option carefully; once you have eliminated options, reread the question before selecting your final choice or choices.
 - Look for comparable or alike options and eliminate these.
 - Determine if there is an umbrella option; if so, this could be the correct option.
 - Identify any closed-ended words; if present, the option is likely incorrect.
 - Use the ABCs, airway, breathing, and circulation, Maslow’s Hierarchy of Needs, and the steps of the Nursing Process to answer questions that require prioritizing.
 - Use therapeutic communication techniques to answer communication questions and remember to focus on the client’s thoughts, feelings, concerns, anxieties, and fears.
 - Use delegating and assignment-making guidelines to match the client’s needs with the scope of practice of the health care provider.
 - Use pharmacology guidelines to select the correct option if the question addresses a medication.
 - Determine whether the question is a positive or negative event query.

10. A Testlet is also known as a Case Study. Information about a client or event is presented in the testlet followed by several questions that relate to the information. These questions can be in a multiple choice format or an alternate item format. It is important to read all of the data in the question and look for abnormalities in the information presented before answering the accompanying questions.

III. Strategic Words (Boxes 4-4 and 4-5)

- A. Strategic words focus your attention on a critical point to consider when answering the question and will assist you in eliminating the incorrect options. These words can be located in either the event or the query of the question.

BOX 4-2 Practice Question: Avoiding the “What if ...?” Syndrome and Reading into the Question

The nurse is caring for a hospitalized client with a diagnosis of heart failure who suddenly complains of shortness of breath and dyspnea. The nurse should take which immediate action?

1. Administer oxygen to the client
2. Prepare to administer furosemide
3. Elevate the head of the client’s bed
4. Call the health care provider (HCP)

Answer: 3

Test-Taking Strategy: You may immediately think that the client has developed pulmonary edema, a complication of heart failure, and needs a diuretic. Although pulmonary edema is a complication of heart failure, the question does not specifically state that pulmonary edema has developed, and the client could be experiencing shortness of breath or dyspnea as a symptom of heart failure exacerbation. This is why it is important to base your answer only on the information presented, without assuming something else could be occurring. Read the question carefully. Note the **strategic word**, immediate, and **focus on the data in the question**, the client’s complaints. An HCP’s prescription is needed to administer oxygen. Although the HCP may need to be notified, this is not the immediate action. Furosemide is a diuretic and may or may not be prescribed for the client; further data would be needed in order to make this determination. Because there are no data in the question that indicate the presence of pulmonary edema, option 3 is correct. Additionally, **focus on what the question is asking**. The question is asking you for a nursing action, so that is what you need to look for as you eliminate the incorrect options. Use nursing knowledge and test-taking strategies to assist in answering the question. Remember to **focus on the data in the question**, **focus on what the question is asking**, and **avoid the “What if ...?” syndrome and reading into the question**.

BOX 4-3 Ingredients of a Question: Event, Event Query, and Options

Event: The nurse is caring for a client with terminal cancer.

Event Query: The nurse should consider which factor when planning opioid pain relief?

Options:

1. Not all pain is real.
2. Opioid analgesics are highly addictive.
3. Opioid analgesics can cause tachycardia.
4. Around-the-clock dosing gives better pain relief than as-needed dosing.

Answer: 4

Test-Taking Strategy: Focus on **what the question is asking** and consider the client’s diagnosis of terminal cancer. Around-the-clock dosing provides increased pain relief and decreases stressors associated with pain, such as anxiety and fear. Pain is what the client describes it as, and any indication of pain should be perceived as real for the client. Opioid analgesics may be addictive, but this is not a concern for a client with terminal cancer. Not all opioid analgesics cause tachycardia. Remember to focus on **what the question is asking**.

BOX 4-4 Common Strategic Words: Words That Indicate the Need to Prioritize and Words That Reflect Assessment

Words That Indicate the Need to Prioritize	Words That Reflect Assessment
Best	Ascertain
Early or late	Assess
Essential	Check
First	Collect
Highest priority	Determine
Immediate	Find out
Initial	Gather
Most	Identify
Most appropriate	Monitor
Most important	Observe
Most likely	Obtain information
Next	Recognize
Primary	
Vital	

BOX 4-5 Practice Question: Strategic Words

The nurse is caring for a client who just returned from the recovery room after undergoing abdominal surgery. The nurse should monitor for which early sign of hypovolemic shock?

1. Sleepiness
2. Increased pulse rate
3. Increased depth of respiration
4. Increased orientation to surroundings

Answer: 2

Test-Taking Strategy: Note the **strategic word**, early, in the query and the word just in the event. Think about the pathophysiology that occurs in hypovolemic shock to direct you to the correct option. Restlessness is one of the earliest signs followed by cardiovascular changes (increased heart rate and a decrease in blood pressure). Sleepiness is expected in a client who has just returned from surgery. Although increased depth of respirations occurs in hypovolemic shock, it is not an early sign. Rather, it occurs as the shock progresses. This is why it is important to recognize the **strategic word**, early, when you read the question. It requires the ability to discern between early and late signs of impending shock. Increased orientation to surroundings is expected and will occur as the effects of anesthesia resolve. Remember to look for **strategic words**, in both the event and the query of the question.

- B. Some strategic words may indicate that all options are correct and that it will be necessary to prioritize to select the correct option; words that reflect the process of assessment are also important to note (see **Box 4-4**). Words that reflect assessment usually indicate the need to look for an option that is a first step, since assessment is the first step in the nursing process.
- C. As you read the question, look for the strategic words; strategic words make a difference regarding the focus of the question. Throughout this book,

BOX 4-6 Practice Question: Subject of the Question

The nurse is teaching a client in skeletal leg traction about measures to increase bed mobility. Which item would be most helpful for this client?

1. Television
2. Fracture bedpan
3. Overhead trapeze
4. Reading materials

Answer: 3

Test-Taking Strategy: Focus on the **subject**, increasing bed mobility. Also note the **strategic word**, most. The use of an overhead trapeze is extremely helpful in assisting a client to move about in bed and to get on and off the bedpan. Television and reading materials are helpful in reducing boredom and providing distraction and a fracture bedpan is useful in reducing discomfort with elimination; these items are helpful for a client in traction, but they are not directly related to the subject of the question. Remember to focus on the **subject**.

strategic words presented in the question, such as those that indicate the need to prioritize, are bolded. If the test-taking strategy is to focus on strategic words, then strategic words is highlighted in **blue** where it appears in the test-taking strategy.

IV. Subject of the Question (Box 4-6)

- A. The subject of the question is the specific topic that the question is asking about.
- B. Identifying the subject of the question will assist in eliminating the incorrect options and direct you in selecting the correct option. Throughout this book, if the subject of the question is a specific strategy to use in answering the question correctly, it is highlighted in **blue** in the test-taking strategy. Also, the specific content area to review, such as heart failure, is bold in **magenta** where it appears in the test-taking strategy.
- C. The highlighting of the strategy and specific content areas will provide you with guidance on what strategies to review in Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam and the content areas in need of further remediation in Saunders Comprehensive Review for the NCLEX-RN® Examination.

V. Positive and Negative Event Queries (Boxes 4-7 and 4-8)

- A. A positive event query uses strategic words that ask you to select an option that is correct; for example, the event query may read, “Which statement by a client indicates an understanding of the side effects of the prescribed medication?”
- B. A negative event query uses strategic words that ask you to select an option that is an incorrect item or statement; for example, the event query may read,

BOX 4-7 Practice Question: Positive Event Query

The nurse provides medication instructions to a client about digoxin. Which statement by the client indicates an understanding of its adverse effects?

1. “Blurred vision is expected.”
2. “If I am nauseated or vomiting, I should stay on liquids and take some liquid antacids.”
3. “This medication may cause headache and weakness but that is nothing to worry about.”
4. “If my pulse rate drops below 60 beats per minute I should let my health care provider know.”

Answer: 4

Test-Taking Strategy: This question is an example of a positive event query question. Note the words indicates an understanding, and focus on the **subject**, adverse effects. Additionally, **focus on the data** provided in the options. Digoxin is a cardiac glycoside and works by increasing contractility of the heart. This medication has a narrow therapeutic range and a major concern is toxicity. Currently, it is considered second-line treatment for heart failure because of its narrow therapeutic range and potential for adverse effects. Adverse effects that indicate toxicity include gastrointestinal disturbances, neurological abnormalities, bradycardia or other cardiac irregularities, and ocular disturbances. If any of these occur, the health care provider (HCP) is notified. Additionally, the client should notify the HCP if the pulse rate drops below 60 beats per minute because serious dysrhythmias are another potential adverse effect of digoxin therapy. Remember to **focus on the data** provided and note positive event queries.

BOX 4-8 Practice Question: Negative Event Query

The nurse has reinforced discharge instructions to a client who has undergone a right mastectomy with axillary lymph node dissection. Which statement by the client indicates a need for further teaching regarding home care measures?

1. “I should use a straight razor to shave under my arms.”
2. “I need to be sure that I do not have blood pressures or blood drawn from my right arm.”
3. “I should inform all of my other health care providers that I have had this surgical procedure.”
4. “I need to be sure to wear thick mitt hand covers or use thick pot holders when I am cooking and touching hot pans.”

Answer: 1

Test-Taking Strategy: This question is an example of a **negative event query**. Note the **strategic words**, need for further teaching. These strategic words indicate that you need to select an option that identifies an incorrect client statement. Recall that edema and infection are concerns with this client due to the removal of lymph nodes in the surgical area. Lymphadenopathy can result and the client needs to be instructed in the measures that will avoid trauma to the affected arm. Recalling that trauma to the affected arm could potentially result in edema and/or infection will direct you to the correct option. Remember to watch for **negative event queries**.

“Which statement by a client indicates a need for further teaching about the side effects of the prescribed medication?”

VI. Questions That Require Prioritizing

- A. Many questions in the examination will require you to use the skill of prioritizing nursing actions.
- B. Look for the strategic words in the question that indicate the need to prioritize (see **Box 4-4**).
- C. Remember that when a question requires prioritization, all options may be correct and you need to determine the correct order of action.
- D. Strategies to use to prioritize include the ABCs (airway–breathing–circulation), Maslow’s Hierarchy of Needs theory, and the steps of the nursing process.
- E. The ABCs (**Box 4-9**)
 1. Use the ABCs—airway–breathing–circulation—when selecting an answer or determining the order of priority.
 2. Remember the order of priority: airway–breathing–circulation.
 3. Airway is always the first priority. Note that an exception occurs when cardiopulmonary resuscitation is performed; in this situation, the nurse follows the CAB (compressions–airway–breathing) guidelines.
- F. Maslow’s Hierarchy of Needs theory (**Box 4-10**; **Fig. 4-1**)
 1. According to Maslow’s Hierarchy of Needs theory, physiological needs are the priority, followed by safety and security needs, love and belonging needs, self-esteem needs, and, finally, self-actualization needs; select the option or determine the order of priority by addressing physiological needs first.

BOX 4-9 Practice Question: Use of the ABCs

A client with a diagnosis of cancer is receiving morphine sulfate for pain. The nurse should employ which priority action in the care of the client?

1. Monitor stools.
2. Encourage fluid intake.
3. Monitor urine output.
4. Encourage the client to cough and deep breathe.

Answer: 4

Test-Taking Strategy: Use the **ABCs—airway–breathing–circulation**—as a guide to direct you to the correct option and note the **strategic word**, priority. Recall that morphine sulfate suppresses the cough reflex and the respiratory reflex, and a common adverse effect is respiratory depression. Coughing and deep breathing can assist with ensuring adequate oxygenation since the number of respirations per minute can potentially be decreased in a client receiving this medication. Although options 1, 2, and 3 are components of the plan of care, the correct option addresses airway. Remember to use the **ABCs—airway–breathing–circulation**—to prioritize.

BOX 4-10 Practice Question: Maslow's Hierarchy of Needs Theory

The nurse caring for a client experiencing dystocia determines that the priority is which action?

1. Position changes and providing comfort measures
2. Explanations to family members about what is happening to the client
3. Monitoring for changes in the physical condition of the mother and fetus
4. Reinforcement of breathing techniques learned in child-birth preparatory classes

Answer: 3

Test-Taking Strategy: All the options are correct and would be implemented during the care of this client. Note the **strategic word**, priority, and use **Maslow's Hierarchy of Needs theory** to prioritize, remembering that physiological needs come first. Also, the correct option is the only one that addresses both the mother and the fetus. Remember to use **Maslow's Hierarchy of Needs theory** to prioritize.

FIGURE 4-1 Use Maslow's Hierarchy of Needs theory to establish priorities.

2. When a physiological need is not addressed in the question or noted in one of the options, continue to use Maslow's Hierarchy of Needs theory sequentially as a guide and look for the option that addresses safety.

G. Steps of the nursing process

1. Use the steps of the nursing process to prioritize.
2. The steps include assessment, analysis, planning, implementation, and evaluation (AAPIE) and are followed in this order.
3. Assessment
 - a. Assessment questions address the process of gathering subjective and objective data relative to the client, confirming the data, and communicating and documenting the data.
 - b. Remember that assessment is the first step in the nursing process.
 - c. When you are asked to select your first, immediate, or initial nursing action, follow the steps of the nursing process to prioritize when selecting the correct option.
 - d. Look for words in the options that reflect assessment (see **Box 4-4**).
 - e. If an option contains the concept of assessment or the collection of client data, the best choice is to select that option (**Box 4-11**).
 - f. If an assessment action is not one of the options, follow the steps of the nursing process as your guide to select your next best action.
 - g. Possible exception to the guideline—if the question presents an emergency situation, read carefully; in an emergency situation, an intervention may be the priority rather than taking the time to assess further.

BOX 4-11 Practice Question: The Nursing Process—Assessment

A client who had an application of a right arm cast complains of pain at the wrist when the arm is passively moved. What action should the nurse take first?

1. Elevate the arm.
2. Document the findings.
3. Medicate with an additional dose of an opioid.
4. Check for paresthesias and paralysis of the right arm.

Answer: 4

Test-Taking Strategy: Note the **strategic word**, first. Based on the **data in the question**, **determine if an abnormality exists**. The question event indicates that the client complains of pain at the wrist when the arm is passively moved. This could indicate an abnormality; therefore, further assessment or intervention is required. Use the **steps of the nursing process**, remembering that assessment is the first step. The only option that addresses assessment is the correct option. Options 1, 2, and 3 address the implementation step of the nursing process. Also, these options are inaccurate first actions. The arm in a cast should have already been elevated. The client may be experiencing compartment syndrome, a complication following trauma to the extremities and application of a cast. Additional data need to be collected to determine whether this complication is present. Remember that assessment is the first step in the **nursing process**.

BOX 4-12 Practice Question: The Nursing Process—Analysis

The nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45, Pco_2 30 mm Hg, and HCO_3 22 mEq/L (22 mmol/L). The nurse analyzes these results as indicating which condition?

1. Metabolic acidosis, compensated
2. Respiratory alkalosis, compensated
3. Metabolic alkalosis, uncompensated
4. Respiratory acidosis, uncompensated

Answer: 2

Test-Taking Strategy: Use the **steps of the nursing process** and analyze the values. The question does not require further assessment; therefore, it is appropriate to move to the next step in the nursing process, analysis. The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the Pco_2 . In this situation, the pH is at the high end of the normal value and the Pco_2 is low. So, you can eliminate options 1 and 3. In an alkalytic condition, the pH is elevated. The values identified indicate a respiratory alkalosis. Compensation occurs when the pH returns to a normal value. Because the pH is in the normal range at the high end, compensation has occurred. Remember that analysis is the second step in the **nursing process**.

4. Analysis (**Box 4-12**)
 - a. Analysis questions are the most difficult questions because they require understanding of the principles of physiological responses and require interpretation of the assessment data.
 - b. Analysis questions require critical thinking and determining the rationale for therapeutic prescriptions or interventions that may be addressed in the question.
 - c. Analysis questions may address the formulation of a statement that identifies a client need or problem. Analysis questions may also include the communication and documentation of the results from the process of the analysis.
 - d. Often, these types of questions require assimilation of more than one piece of information and application to a client scenario.
5. Planning (**Box 4-13**)
 - a. Planning questions require prioritizing client problems, determining goals and outcome criteria for goals of care, developing the plan of care, and communicating and documenting the plan of care.
 - b. Remember that actual client problems rather than potential client problems will most likely be the priority.
6. Implementation (**Box 4-14**)
 - a. Implementation questions address the process of organizing and managing care, counseling and teaching, providing care to

BOX 4-13 Practice Question: The Nursing Process—Planning

The nurse developing a plan of care for a client with a cataract understands that which problem is the priority?

1. Concern about the loss of eyesight
2. Altered vision due to opacity of the ocular lens
3. Difficulty moving around because of the need for glasses
4. Becoming lonely because of decreased community immersion

Answer: 2

Test-Taking Strategy: Note the **strategic word**, priority, and use the **steps of the nursing process**. This question relates to planning nursing care and asks you to identify the priority problem. Use **Maslow's Hierarchy of Needs theory** to answer the question, remembering that physiological needs are the priority. Concern and becoming lonely are psychosocial needs and would be the last priorities. Note that the correct option directly addresses the client's problem. Remember that planning is the third step of the **nursing process**.

BOX 4-14 Practice Question: The Nursing Process—Implementation

The nurse is caring for a hospitalized client with angina pectoris who begins to experience chest pain. The nurse administers a nitroglycerin tablet sublingually as prescribed, but the pain is unrelieved. The nurse should take which action next?

1. Reposition the client.
2. Call the client's family.
3. Contact the health care provider.
4. Administer another nitroglycerin tablet.

Answer: 4

Test-Taking Strategy: Note the **strategic word**, next, and use the **steps of the nursing process**. Implementation questions address the process of organizing and managing care. This question also requires that you prioritize nursing actions. Additionally, **focus on the data in the question** to assist in **avoiding reading into the question**. You may think it is necessary to check the blood pressure before administering another tablet, which is correct. However, there are no data in the question indicating that the blood pressure is abnormal and could not sustain normality if another tablet were given. In addition, checking the blood pressure is not one of the options. Recalling that the nurse would administer 3 nitroglycerin tablets 5 minutes apart from each other to relieve chest pain in a hospitalized client will assist in directing you to the correct option. Remember that implementation is the fourth step of the **nursing process**.

- achieve established goals, supervising and coordinating care, and communicating and documenting nursing interventions.
 - b. Focus on a nursing action rather than on a medical action when you are answering a question, unless the question is asking you what prescribed medical action is anticipated.

- c. On the NCLEX-RN exam, the only client that you need to be concerned about is the client in the question that you are answering; avoid the “What if ...?” syndrome and remember that the client in the question on the computer screen is your only assigned client.
 - d. Answer the question from a textbook and ideal point of view; remember that the nurse has all of the time and all of the equipment needed to care for the client readily available at the bedside; remember that you do not need to run to the supply room to obtain, for example, sterile gloves because the sterile gloves will be at the client’s bedside.
7. Evaluation (Box 4-15)
- a. Evaluation questions focus on comparing the actual outcomes of care with the expected outcomes and on communicating and documenting findings.
 - b. These questions focus on assisting in determining the client’s response to care and identifying factors that may interfere with achieving expected outcomes.

BOX 4-15 Practice Question: The Nursing Process—Evaluation

The nurse is evaluating the client’s response to treatment of a pleural effusion with a chest tube. The nurse notes a respiratory rate of 20 breaths per minute, fluctuation of the fluid level in the water seal chamber, and a decrease in the amount of drainage by 30 mL since the previous shift. Based on this information, which interpretation should the nurse make?

1. The client is responding well to treatment.
2. Suction should be decreased to the system.
3. The system should be assessed for an air leak.
4. Water should be added to the water seal chamber.

Answer: 1

Test-Taking Strategy: Use the **steps of the nursing process** and note that the nurse needs to evaluate the client’s response to treatment. Focus on the **subject** and the **data in the question**. Also, **determine if an abnormality exists** based on these data. Remember that fluctuation in the water seal chamber is a normal and expected finding with a chest tube. Since the client is being treated for a pleural effusion, it can be determined that he or she is responding well to treatment if the amount of drainage is gradually decreasing because the fluid from the pleural effusion is being effectively removed. If the drainage were to stop suddenly, the chest tube should be assessed for a kink or blockage. There is no indication based on the **data in the question** to decrease suction to the system; in fact, it is unclear as to whether the client is on suction at all. There are also no **data in the question** indicating an air leak. Lastly, there are no **data in the question** indicating the need to add water to the water seal chamber; again, it is unclear as to whether the client has this type of chest tube versus a dry suction chest tube. Remember that evaluation is the fifth step of the **nursing process**.

BOX 4-16 Practice Question: Determine If an Abnormality Exists

The nurse is caring for a client being admitted to the emergency department with a chief complaint of anorexia, nausea, and vomiting. The nurse asks the client about the home medications being taking. The nurse would be most concerned if the client stated that which medication was being taken at home?

1. Digoxin
2. Captopril
3. Losartan
4. Furosemide

Answer: 1

Test-Taking Strategy: Note the **strategic word**, most. The first step in approaching the answer to this question is to **determine if an abnormality exists**. The client is complaining of anorexia, nausea, and vomiting; therefore, an abnormality does exist. This tells you that this could be an adverse or toxic effect of one of the medications listed. Although gastrointestinal distress can occur as an expected side effect of many medications, anorexia, nausea, and vomiting are hallmark signs of digoxin toxicity. Therefore, the nurse would be most concerned with this medication if taken at home by the client. Remember to first **determine if an abnormality exists** in the event before choosing the correct option.

- c. In an evaluation question, watch for negative event queries because they are frequently used in evaluation-type questions.

H. Determine if an Abnormality Exists (Box 4-16)

1. In the event, the client scenario will be described. Use your nursing knowledge to determine if any of the information presented is indicating an abnormality.
2. If an abnormality exists, either further assessment or further intervention will be required. Therefore, continuing to monitor or documenting will not be a correct answer; don’t select these options if they are presented!

VII. Client Needs

A. Safe and Effective Care Environment

1. According to the National Council of State Boards of Nursing (NCSBN), these questions test the concepts of providing safe nursing care and collaborating with other health care team members to facilitate effective client care; these questions also focus on the protection of clients, significant others, and health care personnel from environmental hazards.
2. Focus on safety with these types of questions, and remember the importance of hand washing, call lights or bells, bed positioning, appropriate use of side rails, asepsis, use of standard and other precautions, triage, and emergency response planning.

B. Physiological Integrity

1. The NCSBN indicates that these questions test the concepts that the nurse provides care as it relates to comfort and assistance in the performance of activities of daily living as well as care related to the administration of medications and parenteral therapies.
2. These questions also address the nurse's ability to reduce the client's potential for developing complications or health problems related to treatments, procedures, or existing conditions and to provide care to clients with acute, chronic, or life-threatening physical health conditions.
3. Focus on Maslow's Hierarchy of Needs theory in these types of questions and remember that physiological needs are a priority and are addressed first.
4. Use the ABCs—airway—breathing—circulation—and the steps of the nursing process when selecting an option addressing Physiological Integrity.

C. Psychosocial Integrity

1. The NCSBN notes that these questions test the concepts of nursing care that promote and support the emotional, mental, and social well-being of the client and significant others.
2. Content addressed in these questions relates to supporting and promoting the client's or significant others' ability to cope, adapt, or problem-solve in situations such as illnesses; disabilities; or stressful events including abuse, neglect, or violence.
3. In this Client Needs category, you may be asked communication-type questions that relate to how you would respond to a client, a client's family member or significant other, or other health care team members.
4. Use therapeutic communication techniques to answer communication questions because of their effectiveness in the communication process.
5. Remember to select the option that focuses on the thoughts, feelings, concerns, anxieties, or fears of the client, client's family member, or significant other (Box 4-17).

D. Health Promotion and Maintenance

1. According to the NCSBN, these questions test the concepts that the nurse provides and assists in directing nursing care to promote and maintain health.
2. Content addressed in these questions relates to assisting the client and significant others during the normal expected stages of growth and development, and providing client care related to the prevention and early detection of health problems.
3. Use the Teaching and Learning theory if the question addresses client teaching, remembering that the client's willingness, desire, and readiness to learn is the first priority.

BOX 4-17 Practice Question: Communication

A client scheduled for bowel surgery states to the nurse, "I'm not sure if I should have this surgery." Which response by the nurse is appropriate?

1. "It's your decision."
2. "Don't worry. Everything will be fine."
3. "Why don't you want to have this surgery?"
4. "Tell me what concerns you have about the surgery."

Answer: 4

Test-Taking Strategy: Use **therapeutic communication techniques** to answer communication questions and remember to focus on the client's thoughts, feelings, concerns, anxieties, and fears. The correct option is the only one that addresses the client's concern. Additionally, asking the client about what specific concerns he or she has about the surgery will allow for further decisions in the treatment process to be made. Option 1 is a blunt response and does not address the client's concern. Option 2 provides false reassurance. Option 3 can make the client feel defensive and uses the nontherapeutic communication technique of asking "why." Remember to use **therapeutic communication techniques** and focus on the client.

4. Watch for negative event queries because they are frequently used in questions that address Health Promotion and Maintenance and client education.

VIII. Eliminate Comparable or Alike Options (Box 4-18)

- A. When reading the options in multiple-choice or multiple-response questions, look for options that are comparable or alike.
- B. Comparable or alike options can be eliminated as possible answers because it is not likely for both options to be correct.

BOX 4-18 Practice Question: Eliminate Comparable or Alike Options

The nurse is caring for a group of clients. On review of the clients' medical records, the nurse determines that which client is at risk for excess fluid volume?

1. The client taking diuretics
2. The client with an ileostomy
3. The client with kidney disease
4. The client undergoing gastrointestinal suctioning

Answer: 3

Test-Taking Strategy: Focus on the **subject**, the client at risk for excess fluid volume. Think about the pathophysiology associated with each condition identified in the options. The only client who retains fluid is the client with kidney disease. The client taking diuretics, the client with an ileostomy, and the client undergoing gastrointestinal suctioning all lose fluid; these are **comparable or alike** options. Remember to eliminate **comparable or alike** options.

IX. Eliminate Options Containing Closed-Ended Words (Box 4-19)

- A. Some closed-ended words are all, always, every, must, none, never, and only.
- B. Eliminate options that contain closed-ended words because these words imply a fixed or extreme meaning; these types of options are usually incorrect.
- C. Options that contain open-ended words, such as may, usually, normally, commonly, or generally, should be considered as possible correct options.

X. Look for the Umbrella Option (Box 4-20)

- A. When answering a question, look for the umbrella option.

BOX 4-19 Practice Question: Eliminate Options That Contain Closed-Ended Words

A client is to undergo a computed tomography (CT) scan of the abdomen with oral contrast, and the nurse provides pre-procedure instructions. The nurse instructs the client to take which action in the preprocedure period?

1. Avoid eating or drinking after midnight before the test.
2. Limit self to only 2 cigarettes on the morning of the test.
3. Have a clear liquid breakfast only on the morning of the test.
4. Take all routine medications with a glass of water on the morning of the test.

Answer: 1

Test-Taking Strategy: Note the **closed-ended words** only in options 2 and 3 and all in option 4. Eliminate options that contain **closed-ended words** because these options are usually incorrect. Also, note that options 2, 3, and 4 are **comparable or alike** options in that they all involve taking in something on the morning of the test. Remember to eliminate options that contain **closed-ended words**.

BOX 4-20 Practice Question: Look for the Umbrella Option

A client admitted to the hospital is diagnosed with urethritis caused by chlamydial infection. The nurse should implement which precaution to prevent contraction of the infection during care?

1. Enteric precautions
2. Contact precautions
3. Standard precautions
4. Wearing gloves and a mask

Answer: 3

Test-Taking Strategy: Focus on the client's diagnosis and recall that this infection is sexually transmitted. Also, note that the correct option is the **umbrella option**. Remember to look for the **umbrella option**, a broad or universal option that includes the concepts of the other options in it.

- B. The umbrella option is one that is a broad or universal statement and that usually contains the concepts of the other options within it.
- C. The umbrella option will be the correct answer.

XI. Use the Guidelines for Delegating and Assignment Making (Box 4-21)

- A. You may be asked a question that will require you to decide how you will delegate a task or assign clients to other health care providers (HCPs).
- B. Focus on the information in the question and what task or assignment is to be delegated.
- C. When you have determined what task or assignment is to be delegated, consider the client's needs and match the client's needs with the scope of practice of the HCPs identified in the question.
- D. The Nurse Practice Act and any practice limitations define which aspects of care can be delegated and which must be performed by a registered nurse. Use nursing scope of practice as a guide to assist in answering questions. Remember that the NCLEX is a national exam and national standards rather than agency-specific standards must be followed when delegating.
- E. In general, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to an unlicensed assistive personnel (UAP).
- F. A licensed practical nurse (LPN) can perform the tasks that a UAP can perform and can usually perform certain invasive tasks, such as dressings, suctioning, urinary catheterization, and administering medications orally or by the subcutaneous or

BOX 4-21 Practice Question: Use Guidelines for Delegating and Assignment Making

The nurse in charge of a long-term care facility is planning the client assignments for the day. Which client should be assigned to the unlicensed assistive personnel (UAP)?

1. A client on strict bed rest
2. A client with dyspnea who is receiving oxygen therapy
3. A client scheduled for transfer to the hospital for surgery
4. A client with a gastrostomy tube who requires tube feedings every 4 hours

Answer: 1

Test-Taking Strategy: Note the **subject** of the question, the assignment to be delegated to the UAP. When asked questions about delegation, think about the role description and scope of practice of the employee and the needs of the client. A client with dyspnea who is receiving oxygen therapy, a client scheduled for transfer to the hospital for surgery, or a client with a gastrostomy tube who requires tube feedings every 4 hours has both physiological and psychosocial needs that require care by a licensed nurse. The UAP has been trained to care for a client on bed rest. Remember to match the client's needs with the scope of practice of the health care provider.

intramuscular route; some selected piggyback intravenous medications may also be administered.

- G. A registered nurse can perform the tasks that an LPN can perform and is responsible for assessment and planning care, analyzing client data, implementing and evaluating client care, supervising care, initiating teaching, and administering medications intravenously.

XII. Answering Pharmacology Questions (Box 4-22)

- A. If you are familiar with the medication, use nursing knowledge to answer the question.
- B. Remember that the question will identify the generic name of the medication on most occasions.
- C. If the question identifies a medical diagnosis, try to form a relationship between the medication and the diagnosis; for example, you can determine that cyclophosphamide is an antineoplastic medication if the question refers to a client with breast cancer who is taking this medication.
- D. Try to determine the classification of the medication being addressed to assist in answering the question. Identifying the classification will assist in determining a medication's action or side effects or both.
- E. Recognize the common side effects and adverse effects associated with each medication classification and relate the appropriate nursing interventions to each effect; for example, if a side effect is hypertension, the associated nursing intervention would be to monitor the blood pressure.
- F. Focus on what the question is asking or the subject of the question; for example: intended effect, side effect, adverse effect, or toxic effect.
- G. Learn medications that belong to a classification by commonalities in their medication names; for example, medications that act as beta blockers end with “-lol” (e.g., atenolol).
- H. If the question requires a medication calculation, remember that a calculator is available on the computer; talk yourself through each step to be sure the answer makes sense, and recheck the calculation before answering the question, particularly if the answer seems like an unusual dosage.
- I. Pharmacology: Pyramid Points to remember
1. In general, the client should not take an antacid with medication because the antacid will affect the absorption of the medication.

BOX 4-22 Practice Question: Answering Pharmacology Questions

Quinapril hydrochloride is prescribed as adjunctive therapy in the treatment of heart failure. After administering the first dose, the nurse should monitor which item as the priority?

1. Weight
2. Urine output
3. Lung sounds
4. Blood pressure

Answer: 4

Test-Taking Strategy: Focus on the name of the medication and note the **strategic word**, priority. Recall that the medication names of most angiotensin-converting enzyme (ACE) inhibitors end with “-pril” and one of the indications for use of these medications is hypertension. Excessive hypotension (“first-dose syncope”) can occur in clients with heart failure or in clients who are severely sodium-depleted or volume-depleted. Although weight, urine output, and lung sounds would be monitored, monitoring the blood pressure is the priority. Remember to use pharmacology guidelines to assist in answering questions about medications and note the **strategic words**.

2. Enteric-coated and sustained-release tablets should not be crushed; also, capsules should not be opened.
3. The client should never adjust or change a medication dose or abruptly stop taking a medication.
4. The nurse never adjusts or changes the client's medication dosage and never discontinues a medication.
5. The client needs to avoid taking any over-the-counter medications or any other medications, such as herbal preparations, unless they are approved for use by the HCP.
6. The client needs to avoid consuming alcohol.
7. Medications are never administered if the prescription is difficult to read, is unclear, or identifies a medication dose that is not a normal one.
8. Additional strategies for answering pharmacology questions are presented in Saunders Strategies for Test Success: Passing Nursing School and the NCLEX® Exam.

UNIT II

Professional Standards in Nursing

Pyramid to Success

Nurses often care for clients who come from ethnic, cultural, or religious backgrounds that are different from their own. In the past 10 years, the Hispanic population in the United States has increased by 43%, the African American population by 12.3%, and the Asian population by 43% (U.S. Census Bureau, 2010). It is projected that minority groups will make up a majority of the U.S. population by 2042 (U.S. Department of State, 2008). Awareness of and sensitivity to the unique health and illness beliefs and practices of people of different backgrounds are essential for the delivery of safe and effective care. Acknowledgment and acceptance of cultural differences with a nonjudgmental attitude are essential to providing culturally sensitive care. The NCLEX-RN® exam test plan is unique and individualized to the client's culture and beliefs. The nurse needs to avoid stereotyping and needs to be aware that there are several subcultures within cultures and there are several dialects within languages. In nursing practice, the nurse should assess the client's perceived needs before planning and implementing a plan of care.

Across all settings in the practice of nursing, nurses frequently are confronted with ethical and legal issues related to client care. The professional nurse has the responsibility to be aware of the ethical principles, laws, and guidelines related to providing safe and quality care to clients. In the Pyramid to Success, focus on ethical practices; the Nurse Practice Act and clients' rights, particularly confidentiality, information security and confidentiality, and informed consent; advocacy, documentation, and advance directives; and cultural, religious, and spiritual issues. Knowledgeable use of information technology, such as an electronic health record, is also an important role of the nurse.

The National Council of State Boards of Nursing (NCSBN) defines management of care as the nurse

directing nursing care to enhance the care delivery setting to protect the client and health care personnel. As described in the NCLEX-RN exam test plan, a professional nurse needs to provide integrated, cost-effective care to clients by coordinating, supervising, and collaborating or consulting with members of the interprofessional health care team. A primary Pyramid Point focuses on the skills required to prioritize client care activities. Pyramid Points also focus on concepts of leadership and management, the process of delegation, emergency response planning, and triaging clients.

Client Needs: Learning Objectives

Safe and Effective Care Environment

- Acting as a client advocate
- Integrating advance directives into the plan of care
- Becoming familiar with the emergency response plan
- Delegating client care activities and providing continuity of care
- Ensuring that ethical practices are implemented
- Ensuring that informed consent has been obtained
- Ensuring that legal rights and responsibilities are maintained
- Collaborating with interprofessional teams
- Establishing priorities related to client care activities
- Instituting quality improvement procedures
- Integrating case management concepts
- Maintaining confidentiality and information security issues related to the client's health care
- Supervising the delivery of client care
- Triaging clients
- Upholding client rights
- Using information technology in a confidential manner
- Using leadership and management skills effectively

Health Promotion and Maintenance

- Considering cultural and spiritual issues related to family systems and family planning
- Identifying changes related to the aging process
- Identifying high-risk behaviors of the client
- Performing physical assessment techniques
- Promoting health and preventing disease
- Promoting the client's ability to perform self-care
- Providing health screening and health promotion programs
- Respecting cultural preferences and lifestyle choices

Psychosocial Integrity

- Addressing end-of-life care based on the client's preferences and beliefs
- Assessing the use of effective coping mechanisms
- Becoming aware of cultural and spiritual preferences and incorporating these preferences when planning and implementing care
- Identifying abuse and neglect issues
- Identifying clients who do not speak or understand English and determining how language needs will be met by the use of agency-approved interpreters
- Identifying end-of-life care issues
- Identifying family dynamics as they relate to the client's culture

- Identifying support systems for the client
- Providing a therapeutic environment and building a relationship based on trust
- Respecting religious and spiritual influences on health (see [Box 5-1](#))

Physiological Integrity

- Ensuring that emergencies are handled using a prioritization procedure
- Identifying cultural and spiritual differences for providing holistic client care
- Identifying cultural issues related to alternative and complementary therapies
- Identifying cultural issues related to receiving blood and blood products
- Implementing therapeutic procedures considering cultural preferences
- Providing nonpharmacological comfort interventions
- Providing nutrition and oral hydration, considering cultural preferences (see [Box 5-1](#))
- Ensuring that palliative and comfort care is provided to the client
- Monitoring for alterations in body systems or unexpected responses to therapy

CHAPTER 5

Cultural Awareness and Health Practices

PRIORITY CONCEPTS Culture; Health Promotion

CRITICAL THINKING What Should You Do?

The nurse is preparing a client for an echocardiogram and notes that the client is wearing a religious medal on a chain around the neck. What should the nurse do with regard to removing this personal item from the client?

Answer located on p. 40.

For reference throughout the chapter, see [Figure 5-1](#) and [Box 5-1](#).

! Cultural awareness includes learning about the cultures of clients with whom you will be working; also, ask clients about their health care practices and preferences.

I. African Americans

A. Description: Citizens or residents of the United States who may have origins in any of the black populations in Africa.

B. Communication

1. Members are competent in standard English.
2. Head nodding does not always mean agreement.
3. Prolonged eye contact may be interpreted as rudeness or aggressive behavior.
4. Nonverbal communication may be important.
5. Personal questions asked on initial contact with a person may be viewed as intrusive.

C. Time orientation and personal space preferences

1. Time orientation varies according to age, socio-economics, and subcultures and may include past, present, or future orientation.
2. Members may be late for an appointment because relationships and events that are occurring may be deemed more important than being on time.
3. Members are comfortable with close personal space when interacting with family and friends.

D. Social roles

1. Large extended-family networks are important; older adults are respected.

2. Many households may be headed by a single-parent woman.
3. Religious beliefs and church affiliation are sources of strength.

E. Health and illness

1. Religious beliefs profoundly affect ideas about health and illness.
2. Food preferences include such items as fried foods, chicken, pork, greens such as collard greens, and rice; some pregnant African American women engage in pica.

F. Health risks

1. Sickle cell anemia
2. Hypertension
3. Heart disease
4. Cancer
5. Lactose intolerance
6. Diabetes mellitus
7. Obesity

G. Interventions

1. Assess the meaning of the client's verbal and nonverbal behavior.
2. Be flexible and avoid rigidity in scheduling care.
3. Encourage family involvement.
4. Alternative modes of healing include herbs, prayer, and laying on of hands practices.

! Assess each individual for cultural preferences because there are many individual and subculture variations.

II. Amish

A. Description

1. The Amish are known for simple living, plain dress, and reluctance to adopt modern convenience and can be considered a distinct ethnic group; the various Amish church fellowships are Christian religious denominations that form a very traditional subgrouping of Mennonite churches.
2. Cultural beliefs and preferences vary depending on specific Amish community membership.

FIGURE 5-1 Giger and Davidhizar's Transcultural Assessment Model.

BOX 5-1 Religions and Dietary Preferences**Buddhism**

Alcohol is usually prohibited.
 Many are lacto-ovo vegetarians.
 Some eat fish, and some avoid only beef.

Church of Jesus Christ of Latter-day Saints (Mormon)

Alcohol, coffee, and tea are usually prohibited.
 Consumption of meat is limited.
 The first Sunday of the month is optional for fasting.

Eastern Orthodox

During Lent, all animal products, including dairy products, are forbidden.
 Fasting occurs during Advent.
 Exceptions from fasting include illness and pregnancy; children may also be exempt.

Hinduism

Many are vegetarians; those who eat meat do not eat beef or pork.
 Fasting rituals vary.
 Children are not allowed to participate in fasting.

Islam

Pork, birds of prey, alcohol, and any meat product not ritually slaughtered are prohibited.
 During the month of Ramadan, fasting occurs during the daytime; some individuals, such as pregnant women, may be exempt from fasting.

Jehovah's Witnesses

Any foods to which blood has been added are prohibited.
 They can eat animal flesh that has been drained.

Judaism

Orthodox believers need to adhere to dietary kosher laws:

- Meats allowed include animals that are vegetable eaters, cloven-hoofed animals (deer, cattle, goats, sheep), and animals that are ritually slaughtered.
- Fish that have scales and fins are allowed.
- Any combination of meat and milk is prohibited; fish and milk are not eaten together.

During Yom Kippur, 24-hour fasting is observed.

Pregnant women, children, and ill individuals are exempt from fasting.

During Passover, only unleavened bread is eaten.

Pentecostal (Assembly of God)

Alcohol is usually prohibited.
 Members avoid consumption of anything to which blood has been added.
 Some individuals avoid pork.

Roman Catholicism

They avoid meat on Ash Wednesday and Fridays of Lent.
 They practice optional fasting during Lent season.
 Children, pregnant women, and ill individuals are exempt from fasting.

Seventh-Day Adventist (Church of God)

Alcohol and caffeinated beverages are usually prohibited.
 Many are lacto-ovo vegetarians; those who eat meat avoid pork.
 Overeating is prohibited; 5 to 6 hours between meals without snacking is practiced.

3. In general, they have fewer risk factors for disease than the general population because of their practice of manual labor, diet, and rare use of tobacco and alcohol; risk of certain genetic disorders is increased because of intermarriage (sexual abuse of women is a problem in some communities).
 4. Diabetes mellitus can become a health issue later in life and is related to the obesity that can occur.
- B. Communication: Usually speak a German dialect called Pennsylvania Dutch; German language is usually used during worship and English is usually learned in school.
- C. Time orientation and personal space preferences
1. Members generally remain separate from other communities, physically and socially.
 2. They often work as farmers, builders, quilters, and homemakers.
- D. Social roles
1. Women are not allowed to hold positions of power in the congregational organization.
 2. Roles of women are considered equally important to those of men but are very unequal in terms of authority.
 3. Family life has a patriarchal structure.
 4. Marriage outside the faith is not usually allowed; unmarried women remain under the authority of their fathers.
- E. Health and illness
1. Most Amish need to have church (bishop and community) permission to be hospitalized because the community will come together to help pay the costs.
 2. Usually, Amish do not have health insurance because it is a “worldly product” and may show a lack of faith in God.
 3. Some of the barriers to modern health care include distance, lack of transportation, cost, and language (most do not understand scientific jargon).
- F. Health risks
1. Genetic disorders because of intermarriage (inbreeding)
 2. Nonimmunization
 3. Sexual abuse of women
- G. Interventions
1. Speak to both the husband and the wife or the unmarried woman and her father regarding health care decisions.
 2. Health instructions must be given in simple, clear language.
 3. Teaching should be focused on health implications associated with nonimmunization, intermarriage, and sexual abuse issues.

 Be alert to cues regarding eye contact, personal space, time concepts, and understanding of the recommended plan of care.

III. Asian Americans

- A. Description: Americans of Asian descent; can include ethnic groups such as Chinese Americans, Filipino Americans, Indian Americans, Vietnamese Americans, Korean Americans, Japanese Americans, and others whose national origin is the Asian continent.
- B. Communication
1. Languages include Chinese, Japanese, Korean, Filipino, Vietnamese, and English.
 2. Silence is valued.
 3. Eye contact may be considered inappropriate or disrespectful (some Asian cultures interpret direct eye contact as a sexual invitation).
 4. Criticism or disagreement is not expressed verbally.
 5. Head nodding does not always mean agreement.
 6. The word “no” may be interpreted as disrespect for others.
- C. Time orientation and personal space preferences
1. Time orientation reflects respect for the past, but includes emphasis on the present and future.
 2. Formal personal space is preferred, except with family and close friends.
 3. Members usually do not touch others during conversation.
 4. For some cultures, touching is unacceptable between members of the opposite sex.
 5. The head is considered to be sacred in some cultures; touching someone on the head may be disrespectful.
- D. Social roles
1. Members are devoted to tradition.
 2. Large extended-family networks are common.
 3. Loyalty to immediate and extended family and honor are valued.
 4. The family unit is structured and hierarchical.
 5. Men have the power and authority, and women are expected to be obedient.
 6. Education is viewed as important.
 7. Religions include Taoism, Buddhism, Confucianism, Shintoism, Hinduism, Islam, and Christianity.
 8. Social organizations are strong within the community.
- E. Health and illness
1. Health is a state of physical and spiritual harmony with nature and a balance between positive and negative energy forces (yin and yang).
 2. A healthy body may be viewed as a gift from the ancestors.
 3. Illness may be viewed as an imbalance between yin and yang.
 4. Illness may also be attributed to prolonged sitting or lying or to overexertion.
 5. Food preferences include raw fish, rice, and vegetables.

 Yin foods are cold and yang foods are hot; one eats cold foods when one has a hot illness, and one eats hot foods when one has a cold illness.

 F. Health risks

1. Hypertension
2. Heart disease
3. Cancer
4. Lactose intolerance
5. Thalassemia

 G. Interventions

1. Be aware of and respect physical boundaries; request permission to touch the client before doing so.
2. Limit eye contact.
3. Avoid gesturing with hands.
4. A female client usually prefers a female health care provider (HCP).
5. Clarify responses to questions and expectations of the HCP.
6. Be flexible and avoid rigidity in scheduling care.
7. Encourage family involvement.
8. Alternative modes of healing include herbs, acupuncture, restoration of balance with foods, massage, and offering of prayers and incense.

 If health care recommendations, interventions, or treatments do not fit within the client's cultural values, they will not be followed.

 IV. Hispanic and Latino Americans

A. Description: Americans of origins in Latin countries; Mexican Americans, Cuban Americans, Colombian Americans, Dominican Americans, Puerto Rican Americans, Spanish Americans, and Salvadoran Americans are some Hispanic and Latino American subgroups.

 B. Communication

1. Languages include primarily English and Spanish.
2. Members tend to be verbally expressive, yet **confidentiality** is important.
3. Avoiding eye contact with a person in authority may indicate respect and attentiveness.
4. Direct confrontation is usually disrespectful and the expression of negative feelings may be impolite.
5. Dramatic body language, such as gestures or facial expressions, may be used to express emotion or pain.

C. Time orientation and personal space preferences

1. Members are usually oriented more to the present.
2. Members may be late for an appointment because relationships and events that are occurring are valued more than being on time.
3. Members are comfortable in close proximity with family, friends, and acquaintances.

4. Members are very tactile and use embraces and handshakes.
5. Members value the physical presence of others.
6. Politeness and modesty are important.

D. Social roles

1. The nuclear family is the basic unit; also, large extended-family networks are common.
2. The extended family is highly regarded.
3. Needs of the family take precedence over the needs of an individual family member.
4. Depending on age and **acculturation** factors, men are usually the decision makers and wage earners, and women are the caretakers and homemakers.
5. Religion is usually Catholicism, but may vary depending on origin.
6. Members usually have strong church affiliations.
7. Social organizations are strong within the community.

E. Health and illness

1. Health may be viewed as a reward from God or a result of good luck.
2. Some members believe that health results from a state of physical and emotional balance.
3. Illness may be viewed by some members to be a result of God's punishment for sins.
4. Some members may adhere to nontraditional health measures such as folk medicine.
5. Food preferences include beans, fried foods, and spicy foods.

F. Health risks

1. Hypertension
2. Heart disease
3. Diabetes mellitus
4. Obesity
5. Lactose intolerance
6. Parasites

G. Interventions

1. Allow time for the client to discuss treatment options with family members.
2. Protect privacy.
3. Offer to call clergy because of the significance of religious preferences related to illnesses.
4. Ask permission before touching a child when planning to examine or care for him or her; some believe that touching the child is important when speaking to the child to prevent "evil-eye."
5. Be flexible regarding time of arrival for appointments and avoid rigidity in scheduling care.
6. Alternative modes of healing include herbs, consultation with lay healers, restoration of balance with hot or cold foods, prayer, and religious medals.

 Treat each client and individuals accompanying the client with respect and be aware of the differences and diversity of beliefs about health, illness, and treatment modalities.

V. Native Americans

A. Description: Term that the U.S. government uses to describe indigenous peoples from the regions of North America encompassed by the continental United States, including parts of Alaska, and the island state of Hawaii; comprises a large number of distinct tribes, states, and **ethnic groups**, many of which survive as intact political communities.

B. Communication

1. There is much linguistic diversity, depending on origin.
2. Use of a professional interpreter is important because of privacy concerns and because accuracy of communication is made clearer.
3. Silence indicates respect for the speaker for some groups.
4. Some members may speak in a low tone of voice and expect others to be attentive.
5. Eye contact may be viewed as a sign of disrespect.
6. Body language is important.

C. Time orientation and personal space preferences

1. Members are oriented primarily to the present.
2. Personal space is important.
3. Members may lightly touch another person's hand during greetings.
4. Massage may be used for the newborn to promote bonding between the infant and mother.
5. Some groups may prohibit touching of a dead body.

D. Social roles

1. Members are family oriented.
2. The basic family unit is the extended family, which often includes persons from several households.
3. In some groups, grandparents are viewed as family leaders.
4. Elders are honored.
5. Children are taught to respect traditions.
6. The father usually does all work outside the home, and the mother assumes responsibility for domestic duties.
7. Sacred myths and legends provide spiritual guidance for some groups.
8. Most members adhere to some form of Christianity, and religion and healing practices are usually integrated.
9. Community social organizations are important.

E. Health and illness

1. Health is usually considered a state of harmony between the individual, family, and environment.
2. Some groups believe that illness is caused by supernatural forces and disequilibrium between the person and environment.
3. Traditional health and illness beliefs may continue to be observed by some groups, including natural and religious folk medicine tradition.

4. For some groups, food preferences include corn-meal, fish, game, fruits, and berries.

F. Health risks

1. Alcohol abuse
2. Obesity
3. Heart disease
4. Diabetes mellitus
5. Tuberculosis
6. Arthritis
7. Lactose intolerance
8. Gallbladder disease

G. Interventions

1. Clarify communication.
2. Understand that the client may be attentive, even when eye contact is absent.
3. Be attentive to your own use of body language when caring for the client or family.
4. Obtain input from members of the extended family.
5. Encourage the client to personalize space in which health care is delivered; for example, encourage the client to bring personal items or objects to the hospital.
6. In the home, assess for the availability of running water, and modify infection control and hygiene practices as necessary.
7. Alternative modes of healing include herbs, restoration of balance between the person and the universe, and consultation with traditional healers.

! If language barriers pose a problem, seek a qualified medical interpreter; avoid using ancillary staff or family members as interpreters.

VI. White Americans

A. Description: Term used to include U.S. citizens or residents having origins in any of the original people of Europe, the Middle East, or North Africa; the term is interchangeable with Caucasian American.

B. Communication

1. Languages include language of origin (e.g., Italian, Polish, French, Russian) and English.
2. Silence can be used to show respect or disrespect for another, depending on the situation.
3. Eye contact is usually viewed as indicating trustworthiness in most origins.

C. Time orientation and personal space preferences

1. Members are usually future oriented.
2. Time is valued; members tend to be on time and to be impatient with people who are not on time.
3. Some members may tend to avoid close physical contact.
4. Handshakes are usually used for formal greetings.

D. Social roles

1. The nuclear family is the basic unit; the extended family is also important.

2. The man is usually the dominant figure, but a variation of gender roles exists within families and relationships.
 3. Religions are varied, depending on origin.
 4. Community social organizations are important.
- E. Health and illness
1. Health is usually viewed as an absence of disease or illness.
 2. Many members usually have a tendency to be stoic when expressing physical concerns.
 3. Members usually rely primarily on the modern Western health care delivery system.
 4. Food preferences are based on origin; many members prefer foods containing carbohydrates and meat items.
- F. Health risks
1. Cancer
 2. Heart disease
 3. Diabetes mellitus
 4. Obesity
 5. Hypertension
 6. Thalassemia

- G. Interventions
1. Assess the meaning of the client's verbal and nonverbal behavior.
 2. Respect the client's personal space and time.
 3. Be flexible and avoid rigidity in scheduling care.
 4. Encourage family involvement.

 Some cultures believe that eye contact gives the other person an opening to see into, or to take, the soul.

VII. End-of-Life Care (Box 5-2)

- A. People in the Jewish faith generally oppose prolonging life after irreversible brain damage.
- B. Some members of Eastern Orthodox religions, Muslims, and Orthodox Jews may prohibit, oppose, or discourage autopsy.
- C. Muslims permit organ transplant for the purpose of saving human life.
- D. The Amish permit organ donation with the exception of heart transplants (the heart is the soul of the body).
- E. Buddhists in the United States encourage organ donation and consider it an act of mercy.

BOX 5-2 Religion and End-of-Life Care

Christianity

Amish

Funerals are conducted in the home without a eulogy, flower decorations, or any other display; caskets are plain and simple, without adornment.

At death, a woman is usually buried in her bridal dress.

One is believed to live on after death, with either eternal reward in heaven or punishment in hell.

Catholic and Orthodox

A priest anoints the sick.

Other sacraments before death include reconciliation and Holy Communion.

Church of Jesus Christ of Latter-day Saints (Mormons)

A sacrament may be administered if the client requests it.

Protestant

No last rites are provided (anointing of the sick is accepted by some groups).

Prayers are given to offer comfort and support.

Jehovah's Witnesses

Members are not allowed to receive a blood transfusion.

Members believe that the soul cannot live after the body has died.

Islam

Second-degree male relatives such as cousins or uncles should be the contact people and determine whether the client or family should be given information about the client.

The client may choose to face Mecca (west or southwest in the United States).

The head should be elevated above the body.

Discussions about death usually are not welcomed.

Stopping medical treatment is against the will of Allah (Arabic word for God).

Grief may be expressed through slapping or hitting the body.

If possible, only a same-sex Muslim should handle the body after death; if not possible, non-Muslims should wear gloves so as not to touch the body.

Judaism

A client placed on life support should remain so until death.

A dying person should not be left alone (a rabbi's presence is desired).

Autopsy and cremation are usually not allowed.

Hinduism

Rituals include tying a thread around the neck or wrist of the dying person, sprinkling the person with special water, and placing a leaf of basil on the person's tongue.

After death, the sacred threads are not removed, and the body is not washed.

Buddhism

A shrine to Buddha may be placed in the client's room.

Time for meditation at the shrine is important and should be respected.

Clients may refuse medications that may alter their awareness (e.g., opioids).

After death, a monk may recite prayers for 1 hour (need not be done in the presence of the body).

- F. Some members of Mormon, Eastern Orthodox, Islamic, and Jewish (Conservative and Orthodox) faiths discourage, oppose, or prohibit cremation.
- G. Hindus usually prefer cremation and desire to cast the ashes in a holy river.
- H. African Americans
 1. Members discuss issues with the spouse or older family member (elders are held in high respect).
 2. Family is highly valued and is central to the care of terminally ill members.
 3. Open displays of emotion are common and accepted.
 4. Members prefer to die at home.
- I. Asian Americans
 1. Family members may make decisions about care and often do not tell the client the diagnosis or prognosis.
 2. Dying at home may be considered bad luck.
 3. Organ donation may not be allowed in some ethnic groups.
- J. Hispanic and Latino groups
 1. The family generally makes decisions and may request to withhold the diagnosis or prognosis from the client.
 2. Extended-family members often are involved in end-of-life care (pregnant women may be prohibited from caring for dying clients or attending funerals).
 3. Several family members may be at the dying client's bedside.
 4. Vocal expression of grief and mourning is acceptable and expected.
 5. Members may refuse procedures that alter the body, such as autopsy.
 6. Dying at home may be considered bad luck.
- K. Native Americans
 1. Family meetings may be held to make decisions about end-of-life care and the type of treatments that should be pursued.
 2. Some groups avoid contact with the dying (may prefer to die in the hospital).

Provide individualized end-of-life care to the client and families.

VIII. Complementary and Alternative Medicine (CAM)

A. Description

1. Therapies are used in addition to conventional treatment to provide healing resources and focus on the mind-body connection.
2. High-risk therapies (therapies that are invasive) and low-risk therapies (those that are noninvasive) are included in CAM.
3. The National Center for Complementary and Alternative Medicine (NCCAM) has proposed a classification system that includes 5 categories of complementary and alternative types of therapy (Box 5-3).

BOX 5-3 Categories of Complementary and Alternative Medicine

- Whole medical systems
- Mind-body medicine
- Biologically based practices
- Manipulative and body-based practices
- Energy medicine

B. Whole medical systems

1. Traditional Chinese medicine (TCM): Focuses on restoring and maintaining a balanced flow of vital energy; interventions include acupressure, acupuncture, herbal therapies, diet, meditation, tai chi, and qigong (exercise that focuses on breathing, visualization, and movement).
2. Ayurveda: Focuses on the balance of mind, body, and spirit; interventions include diet, medicinal herbs, detoxification, massage, breathing exercises, meditation, and yoga.
3. Homeopathy: Focuses on healing and interventions consisting of small doses of specially prepared plant and mineral extracts that assist in the innate healing process of the body.
4. Naturopathy: Focuses on enhancing the natural healing responses of the body; interventions include nutrition, herbology, hydrotherapy, acupuncture, physical therapies, and counseling.

C. Mind-body medicine

1. Mind-body medicine focuses on the interactions among the brain, mind, body, and behavior and on the powerful ways in which emotional, mental, social, spiritual, and behavioral factors can directly affect health.
2. Interventions include biofeedback, hypnosis, relaxation therapy, meditation, visual imagery, yoga, tai chi, qigong, cognitive-behavioral therapies, group supports, autogenic training, and spirituality.

D. Biologically based practices (Box 5-4)

1. Biologically based therapies in CAM use substances found in nature, such as herbs, foods, and vitamins.
2. Therapies include botanicals, prebiotics and probiotics, whole-food diets, functional foods, animal-derived extracts, vitamins, minerals, fatty acids, amino acids, and proteins.

E. Manipulative and body-based practices

1. Interventions involve manipulation and movement of the body by a therapist.
2. Interventions include practices such as chiropractic and osteopathic manipulation, massage therapy, and reflexology.

F. Energy medicine

1. Energy therapies focus on energy originating within the body or on energy from other sources.

BOX 5-4 Biologically Based Practices**Aromatherapy**

The use of topical or inhaled oils (plant extracts) that promote and maintain health

Herbal Therapies

The use of herbs derived mostly from plant sources that maintain and restore balance and health

Macrobiotic Diet

Diet high in whole-grain cereals, vegetables, beans, sea vegetables, and vegetarian soups

Elimination of meat, animal fat, eggs, poultry, dairy products, sugars, and artificially produced food from the diet

Orthomolecular Therapy

Focus on nutritional balance, including use of vitamins, essential amino acids, essential fats, and minerals

2. Interventions include sound energy therapy, light therapy, acupuncture, qigong, Reiki and Johre, therapeutic touch, intercessory prayer, whole medical systems, and magnetic therapy.

IX. Herbal Therapies (Box 5-5)

- A. Herbal therapy is the use of herbs (plant or a plant part) for their therapeutic value in promoting health.
- B. Some herbs have been determined to be safe, but some herbs, even in small amounts, can be toxic.
- C. If the client is taking prescription medications, the client should consult with the HCP regarding the use of herbs because serious herb-medication interactions can occur.
- D. Client teaching points
 1. Discuss herbal therapies with the HCP before use.
 2. Contact the HCP if any side effects of the herbal substance occur.

3. Contact the HCP before stopping the use of a prescription medication.
4. Avoid using herbs to treat a serious medical condition, such as heart disease.
5. Avoid taking herbs if pregnant or attempting to get pregnant or if nursing.
6. Do not give herbs to infants or young children.
7. Purchase herbal supplements only from a reputable manufacturer; the label should contain the scientific name of the herb, name and address of the manufacturer, batch or lot number, date of manufacture, and expiration date.
8. Adhere to the recommended dose; if herbal preparations are taken in high doses, they can be toxic.
9. Moisture, sunlight, and heat may alter the components of herbal preparations.
10. If surgery is planned, the herbal therapy may need to be discontinued 2 to 3 weeks before surgery.

 Some herbs have been determined to be safe, but some herbs, even in small amounts, can be toxic. Ask the client to discuss herbal therapies with the HCP before use.

X. Low-Risk Therapies

- A. Low-risk therapies are therapies that have no adverse effects and, when implementing care, can be used by the nurse who has training and experience in their use.
- B. Common low-risk therapies
 1. Meditation
 2. Relaxation techniques
 3. Imagery
 4. Music therapy
 5. Massage
 6. Touch
 7. Laughter and humor
 8. Spiritual measures, such as prayer

BOX 5-5 Commonly Used Herbs and Health Products

Aloe: Antiinflammatory and antimicrobial effect; accelerates wound healing

Black cohosh: Produces estrogen-like effects

Chamomile: Antispasmodic and antiinflammatory; produces mild sedative effect

Dehydroepiandrosterone (DHEA): Converts to androgens and estrogen; slows the effects of aging; used for erectile dysfunction

Echinacea: Stimulates the immune system

Garlic: Antioxidant; used to lower cholesterol levels

Ginger: Antiemetic; used for nausea and vomiting

Ginkgo biloba: Antioxidant; used to improve memory

Ginseng: Increases physical endurance and stamina; used for stress and fatigue

Glucosamine: Amino acid that assists in the synthesis of cartilage

Melatonin: A hormone that regulates sleep; used for insomnia

Milk thistle: Antioxidant; stimulates the production of new liver cells, reduces liver inflammation; used for liver and gallbladder disease

Peppermint oil: Antispasmodic; used for irritable bowel syndrome

Saw palmetto: Antiestrogen activity; used for urinary tract infections and benign prostatic hypertrophy

St. John's wort: Antibacterial, antiviral, antidepressant

Valerian: Used to treat nervous disorders such as anxiety, restlessness, and insomnia

CRITICAL THINKING What Should You Do?

Answer: Before certain diagnostic procedures, it is typical to have a client remove personal objects that are worn on the body. The nurse should ask the client about the significance of such an item and its removal because it may have cultural or spiritual significance. The nurse should also determine whether the item will compromise client safety or the test results. If so, the nurse should ask the client if the item can be either removed temporarily or placed on another part of the body during the procedure.

Reference: Lewis et al. (2014), p. 25.

PRACTICE QUESTIONS

1. The ambulatory care nurse is discussing preoperative procedures with a Japanese American client who is scheduled for surgery the following week. During the discussion, the client continually smiles and nods the head. How should the nurse interpret this nonverbal behavior?
 1. Reflecting a cultural value
 2. An acceptance of the treatment
 3. Client agreement to the required procedures
 4. Client understanding of the preoperative procedures
2. When communicating with a client who speaks a different language, which best practice should the nurse implement?
 1. Speak loudly and slowly.
 2. Arrange for an interpreter to translate.
 3. Speak to the client and family together.
 4. Stand close to the client and speak loudly.
3. The nurse educator is providing in-service education to the nursing staff regarding transcultural nursing care; a staff member asks the nurse educator to provide an example of the concept of acculturation. The nurse educator should make which most appropriate response?
 1. “A group of individuals identifying as a part of the Iroquois tribe among Native Americans.”
 2. “A person who moves from China to the United States (U.S.) and learns about and adapts to the culture in the U.S.”
 3. “A group of individuals living in the Azores that identify autonomously but are a part of the larger population of Portugal.”
 4. “A person who has grown up in the Philippines and chooses to stay there because of the sense of belonging to his or her cultural group.”
4. The nurse is providing discharge instructions to a Chinese American client regarding prescribed dietary modifications. During the teaching session, the client continuously turns away from the nurse. The nurse should implement which best action?
 1. Continue with the instructions, verifying client understanding.
 2. Walk around the client so that the nurse constantly faces the client.
 3. Give the client a dietary booklet and return later to continue with the instructions.
 4. Tell the client about the importance of the instructions for the maintenance of health care.
5. A critically ill Hispanic client tells the nurse through an interpreter that she is Roman Catholic and firmly believes in the rituals and traditions of the Catholic faith. Based on the client’s statements, which actions by the nurse demonstrate cultural sensitivity and spiritual support? Select all that apply.
 1. Ensures that a close kin stays with the client.
 2. Makes a referral for a Catholic priest to visit the client.
 3. Removes the crucifix from the wall in the client’s room.
 4. Administers the sacrament of the sick to the client if death is imminent.
 5. Offers to provide a means for praying the rosary if the client wishes.
 6. Reminds the dietary department that meals served on Fridays during Lent do not contain meat.
6. Which clients have a high risk of obesity and diabetes mellitus? Select all that apply.
 1. Latino American man
 2. Native American man
 3. Asian American woman
 4. Hispanic American man
 5. African American woman
7. The nurse is preparing a plan of care for a client, and is asking the client about religious preferences. The nurse considers the client’s religious preferences as being characteristic of a Jehovah’s Witness if which client statement is made?
 1. “I cannot have surgery.”
 2. “I cannot have any medicine.”
 3. “I believe the soul lives on after death.”
 4. “I cannot have any food containing or prepared with blood.”
8. Which meal tray should the nurse deliver to a client of Orthodox Judaism faith who follows a kosher diet?
 1. Pork roast, rice, vegetables, mixed fruit, milk
 2. Crab salad on a croissant, vegetables with dip, potato salad, milk
 3. Sweet and sour chicken with rice and vegetables, mixed fruit, juice
 4. Noodles and cream sauce with shrimp and vegetables, salad, mixed fruit, iced tea

9. An Asian American client is experiencing a fever. The nurse plans care so that the client can self-treat the disorder using which method?
 1. Prayer
 2. Magnetic therapy
 3. Foods considered to be yin
 4. Foods considered to be yang
10. Which is the best nursing intervention regarding complementary and alternative medicine?
 1. Advising the client about “good” versus “bad” therapies
 2. Discouraging the client from using any alternative therapies
 3. Educating the client about therapies that he or she is using or is interested in using
 4. Identifying herbal remedies that the client should request from the health care provider
11. An antihypertensive medication has been prescribed for a client with hypertension. The client tells the clinic nurse that he would like to take an herbal substance to help lower his blood pressure. The nurse should take which action?
 1. Advise the client to read the labels of herbal therapies closely.
 2. Tell the client that herbal substances are not safe and should never be used.
 3. Encourage the client to discuss the use of an herbal substance with the health care provider (HCP).
 4. Tell the client that if he takes the herbal substance he will need to have his blood pressure checked frequently.
12. The nurse educator asks a student to list the 5 main categories of complementary and alternative medicine (CAM), developed by the National Center for Complementary and Alternative Medicine. Which statement, if made by the nursing student, indicates a need for further teaching regarding CAM categories?
 1. “CAM includes biologically based practices.”
 2. “Whole medical systems are a component of CAM.”
 3. “Mind-body medicine is part of the CAM approach.”
 4. “Magnetic therapy and massage therapy are a focus of CAM.”

ANSWERS

1. 1

Rationale: Nodding or smiling by a Japanese American client may reflect only the cultural value of interpersonal harmony. This nonverbal behavior may not be an indication of acceptance of the treatment, agreement with the speaker, or understanding of the procedure.

Test-Taking Strategy: Eliminate options 2 and 3 first because they are **comparable or alike** and are incorrect. From the remaining options, note that the client is Japanese American and think about the characteristics of this group. This will direct you to option 1. In addition, option 4 is an incorrect interpretation of the client’s nonverbal behavior.

Review: The cultural characteristics of **Asian Americans**

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Communication; Culture

References: Giger (2013), p. 317; Jarvis (2016), p. 35.

2. 2

Rationale: Arranging for an interpreter would be the best practice when communicating with a client who speaks a different language. Options 1 and 4 are inappropriate and ineffective ways to communicate. Option 3 is inappropriate because it violates privacy and does not ensure correct translation.

Test-Taking Strategy: Note the **strategic word**, best, in the question and note the **subject**, communicating with a client of a different culture. Eliminate option 3 first because this action can constitute a violation of the client’s right to privacy, and does not represent best practice. Next, eliminate options 1

and 4, noting the word loudly in these options and because they are nontherapeutic actions and also are not best practices.

Review: **Communication techniques** for a client who speaks a different language

Client Needs: Psychosocial Integrity

Integrated Process: Communication and Documentation

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Communication; Culture

Reference: Jarvis (2016), pp. 45–46.

3. 2

Rationale: Acculturation is a process of learning a different culture to adapt to a new or changing environment. Options 1 and 3 describe a subculture. Option 4 describes ethnic identity.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **subject**, acculturation. Note the words a person who moves and adapts in the correct option and relate this to the definition of acculturation.

Review: The definition of **acculturation**

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Teaching and Learning

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Culture; Professionalism

Reference: Jarvis (2016), pp. 14–15.

4. 1

Rationale: Most Chinese Americans maintain a formal distance with others, which is a form of respect. Many Chinese Americans are uncomfortable with face-to-face communications, especially when eye contact is direct. If the client turns away from the nurse during a conversation, the best action is

to continue with the conversation. Walking around the client so that the nurse faces the client is in direct conflict with this cultural practice. The client may consider it a rude gesture if the nurse returns later to continue with the explanation. Telling the client about the importance of the instructions for the maintenance of health care may be viewed as degrading.

Test-Taking Strategy: Note the **strategic word**, best. Focus on the **subject**, the behavior of a Chinese American client. Eliminate options 3 and 4 first because these actions are nontherapeutic. To select from the remaining options, think about the cultural practices of Chinese Americans and recall that direct eye contact may be uncomfortable for the client.

Review: The communication practices of **Asian Americans**

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Client Education; Culture

Reference: Jarvis (2016), p. 36.

❖ 5. 1, 2, 5

Rationale: In times of illness, a Roman Catholic client may turn to prayer for spiritual support. This may include rosary prayers or visits from a priest, who is the spiritual leader in the Roman Catholic faith. Close family members usually want to stay with a dying family member in order to hear the wishes of the client, allowing the soul to leave in peace. A priest, not a nurse, would administer the sacrament of the sick. Roman Catholics would not ask for the crucifix to be removed. Members of other religious groups such as Islam or Judaism may request the removal of the crucifix. Dietary rituals are not a concern at this time.

Test-Taking Strategy: Focus on the **subject**, the Roman Catholic religion. Consider the role of the spiritual leader and family in the Catholic faith. This will assist in selecting options 2 and 5. For the remaining options, recall that the presence of family is a source of support.

Review: Spiritual and religious **Hispanic clients**

Level of Cognitive Ability: Analyzing

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Care Coordination; Culture

Reference: Potter et al. (2015), pp. 111–112, 702–703.

❖ 6. 1, 2, 4, 5

Rationale: Because of their health and dietary practices, Latino Americans, Native Americans, Hispanic Americans, and African Americans have a high risk of obesity and diabetes mellitus. Owing to dietary practices, Asian Americans have a lower risk for obesity and diabetes mellitus.

Test-Taking Strategy: Focus on the **subject**, those with a high risk for diabetes mellitus and obesity. Think about the health and dietary practices of each cultural group in the options to answer correctly.

Review: The **health risks** for various ethnic groups

Level of Cognitive Ability: Analyzing

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Culture; Health Promotion

Reference: Lewis et al. (2014), pp. 908, 1170.

7. 4

Rationale: Among Jehovah's Witnesses, surgery is not prohibited, but the administration of blood and blood products is forbidden. For a Jehovah's Witness, administration of medication is an acceptable practice except if the medication is derived from blood products. This religious group believes that the soul cannot live after death. Jehovah's Witnesses avoid foods prepared with or containing blood.

Test-Taking Strategy: Focus on the **subject**, beliefs of Jehovah's Witnesses. Remember that the administration of blood and any associated blood products is forbidden among Jehovah's Witnesses. Even foods prepared with blood or containing blood are avoided.

Review: The cultural preferences of **Jehovah's Witnesses**

Level of Cognitive Ability: Analyzing

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Care Coordination; Culture

Reference: Lewis et al. (2014), p. 677.

8. 3

Rationale: Members of Orthodox Judaism adhere to dietary kosher laws. In this religion, the dairy-meat combination is unacceptable. Only fish that have scales and fins are allowed; meats that are allowed include animals that are vegetable eaters, cloven hooved, and ritually slaughtered.

Test-Taking Strategy: Focus on the **subject**, dietary kosher laws, and recall that the dairy-meat combination is unacceptable in the Orthodox Judaism group. Eliminate option 1 because this option contains pork roast and milk. Next, eliminate options 2 and 4 because both options contain shellfish.

Review: The dietary rules of members of the **Orthodox Judaism** religious group

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concept: Culture; Nutrition

References: Giger (2013), pp. 516–517; Nix (2013), pp. 266–267.

9. 3

Rationale: In the Asian American culture, health is believed to be a state of physical and spiritual harmony with nature and a balance between positive and negative energy forces (yin and yang). Yin foods are cold and yang foods are hot. Cold foods are eaten when one has a hot illness (fever), and hot foods are eaten when one has a cold illness. Options 1 and 2 are not health practices specifically associated with the Asian American culture or the yin and yang theory.

Test-Taking Strategy: Focus on the **subject**, an Asian American, and the client's diagnosis, fever. Remember that cold foods (yin foods) are eaten when one has a hot illness, and hot foods (yang foods) are eaten when one has a cold illness.

Review: The health practices of the **Asian American** culture

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Planning

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concept: Culture; Thermoregulation

Reference: Jarvis (2016), pp. 18, 20.

10. 3

Rationale: Complementary and alternative therapies include a wide variety of treatment modalities that are used in addition to conventional therapy to treat a disease or illness. Educating the client about therapies that he or she uses or is interested in using is the nurse's role. Options 1, 2, and 4 are inappropriate actions for the nurse to take because they provide advice to the client.

Test-Taking Strategy: Note the **strategic word**, best. Use **therapeutic communication techniques**. Eliminate options 1, 2, and 4 because they are nontherapeutic. Also note that they are **comparable or alike** in that they provide advice to the client. Recommending an herbal remedy or discouraging a client from doing something is not within the role practices of the nurse. In addition, it is nontherapeutic to advise a client to do something.

Review: **Therapeutic communication techniques** and the nurse's role in educating clients about **complementary and alternative medicine**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Client Education; Culture

References: Lewis et al. (2014), pp. 85–86; Perry, Potter, Ostendorf (2014), p. 31.

11. 3

Rationale: Although herbal substances may have some beneficial effects, not all herbs are safe to use. Clients who are being treated with conventional medication therapy should be encouraged to avoid herbal substances because the combination may lead to an excessive reaction or to unknown

interaction effects. The nurse should advise the client to discuss the use of the herbal substance with the HCP. Therefore, options 1, 2, and 4 are inappropriate nursing actions.

Test-Taking Strategy: Eliminate option 2 first because of the **closed-ended word** never. Next, eliminate options 1 and 4 because they are **comparable or alike** and indicate acceptance of using an herbal substance.

Review: The limitations associated with the use of **herbal substances**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Cultural Awareness

Priority Concepts: Client Education; Safety

Reference: Lewis et al. (2014), pp. 81, 85–86.

12. 4

Rationale: The 5 main categories of CAM include whole medical systems, mind-body medicine, biologically based practices, manipulative and body-based practices, and energy medicine. Magnetic therapy and massage therapy are therapies within specific categories of CAM.

Test-Taking Strategy: Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and the need to select the incorrect option. Also, focus on the **subject** of the question, the 5 main categories of CAM. Noting that the question asks about main categories, not specific therapies, will assist in directing you to the correct option.

Review: The categories of **complementary and alternative medicine**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Ethical and Legal Issues

PRIORITY CONCEPTS Ethics; Health Care Law

CRITICAL THINKING What Should You Do?

While preparing a client for surgery scheduled in 1 hour, the client states to the nurse: "I have changed my mind. I don't want this surgery." What should the nurse do?

Answer located on p. 54.

I. Ethics

- A. Description: The branch of philosophy concerned with the distinction between right and wrong on the basis of a body of knowledge, not only on the basis of opinions
- B. **Morals**: Behavior in accordance with customs or tradition, usually reflecting personal or religious beliefs
- C. **Ethical principles**: Codes that direct or govern nursing actions (**Box 6-1**)
- D. Values: Beliefs and attitudes that may influence behavior and the process of decision making
- E. Values clarification: Process of analyzing one's own values to understand oneself more completely regarding what is truly important
- F. Ethical codes
 1. Ethical codes provide broad principles for determining and evaluating client care.
 2. These codes are not legally binding, but the board of nursing has authority in most states to reprimand nurses for unprofessional conduct that results from violation of the ethical codes.
 3. Specific ethical codes are as follows:
 - a. The Code of Ethics for Nurses developed by the International Council of Nurses; Web site: <http://www.icn.ch/about-icn/code-of-ethics-for-nurses/>.
 - b. The American Nurses Association Code of Ethics can be viewed on the American Nurses Association Web site: <http://www.nursingworld.org/codeofethics>.
- G. Ethical dilemma
 1. An ethical dilemma occurs when there is a conflict between 2 or more **ethical principles**.

2. No correct decision exists, and the nurse must make a choice between 2 alternatives that are equally unsatisfactory.
3. Such dilemmas may occur as a result of differences in cultural or religious beliefs.
4. Ethical reasoning is the process of thinking through what one should do in an orderly and systematic manner to provide justification for actions based on principles; the nurse should gather all information to determine whether an ethical dilemma exists, examine his or her own values, verbalize the problem, consider possible courses of action, negotiate the outcome, and evaluate the action taken.

H. Advocate

1. An advocate is a person who speaks up for or acts on the behalf of the client, protects the client's right to make his or her own decisions, and upholds the principle of **fidelity**.
2. An advocate represents the client's viewpoint to others.
3. An advocate avoids letting personal values influence **advocacy** for the client and supports the client's decision, even when it conflicts with the advocate's own preferences or choices.

I. Ethics committees

1. Ethics committees take an interprofessional approach to facilitate dialogue regarding ethical dilemmas.
2. These committees develop and establish policies and procedures to facilitate the prevention and resolution of dilemmas.

 **An important nursing responsibility is to act as a client advocate and protect the client's rights.**

II. Regulation of Nursing Practice

A. Nurse Practice Act

1. A nurse practice act is a series of statutes that have been enacted by each state legislature to regulate the practice of nursing in that state.
2. Nurse practice acts set educational requirements for the nurse, distinguish between nursing

BOX 6-1 Ethical Principles

Autonomy: Respect for an individual's right to self-determination

Nonmaleficence: The obligation to do or cause no harm to another

Beneficence: The duty to do good to others and to maintain a balance between benefits and harms; paternalism is an undesirable outcome of beneficence, in which the health care provider decides what is best for the client and encourages the client to act against his or her own choices

Justice: The equitable distribution of potential benefits and tasks determining the order in which clients should be cared for

Veracity: The obligation to tell the truth

Fidelity: The duty to do what one has promised

practice and medical practice, and define the scope of nursing practice.

3. Additional issues covered by nurse practice acts include licensure requirements for protection of the public, grounds for disciplinary action, rights of the nurse licensee if a disciplinary action is taken, and related topics.
 4. All nurses are responsible for knowing the provisions of the act of the state or province in which they work.
- B. Standards of care**
1. Standards of care are guidelines that identify what the client can expect to receive in terms of nursing care.
 2. The guidelines determine whether nurses have performed duties in an appropriate manner.
 3. If the nurse does not perform duties within accepted standards of care, the nurse places himself or herself in jeopardy of legal action.
 4. If the nurse is named as a defendant in a **malpractice** lawsuit and proceedings show that the nurse followed neither the accepted standards of care outlined by the state or province nurse practice act nor the policies of the employing institution, the nurse's legal liability is clear; he or she is liable.
- C. Employee guidelines**
1. **Respondeat superior:** The employer is held liable for any negligent acts of an employee if the alleged negligent act occurred during the employment relationship and was within the scope of the employee's responsibilities.
 2. **Contracts**
 - a. Nurses are responsible for carrying out the terms of a contractual agreement with the employing agency and the client.
 - b. The nurse-employee relationship is governed by established employee handbooks and client care policies and procedures that create obligations, rights, and duties between those parties.

3. **Institutional policies**
 - a. Written policies and procedures of the employing institution detail how nurses are to perform their duties.
 - b. Policies and procedures are usually specific and describe the expected behavior on the part of the nurse.
 - c. Although policies are not laws, courts generally rule against nurses who violate policies.
 - d. If the nurse practices nursing according to client care policies and procedures established by the employer, functions within the job responsibility, and provides care consistently in a nonnegligent manner, the nurse minimizes the potential for liability.

 **The nurse must follow the guidelines identified in the Nurse Practice Act and agency policies and procedures when delivering client care.**

- D. Hospital staffing**
1. Charges of abandonment may be made against nurses who "walk out" when staffing is inadequate.
 2. Nurses in short staffing situations are obligated to make a report to the nursing administration.
- E. Floating**
1. Floating is an acceptable practice used by health care facilities to alleviate understaffing and overstaffing.
 2. Legally, the nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove lack of knowledge for the performance of assigned tasks.
 3. Nurses in a floating situation must not assume responsibility beyond their level of experience or qualification.
 4. Nurses who float should inform the supervisor of any lack of experience in caring for the type of clients on the new nursing unit.
 5. A resource nurse who is skilled in the care of clients on the unit should also be assigned to the float nurse; in addition, the float nurse should be given an orientation of the unit and the standards of care for the unit should be reviewed (the float nurse can care for "overflow" clients whose acuity level more closely match the nurses' experience).
- F. Disciplinary action**
1. Boards of nursing may deny, revoke, or suspend any license to practice as a registered nurse, according to their statutory authority.
 2. Some causes for disciplinary action are as follows:
 - a. Unprofessional conduct
 - b. Conduct that could affect the health and welfare of the public adversely

- c. Breach of client **confidentiality**
- d. Failure to use sufficient knowledge, skills, or nursing judgment
- e. Physically or verbally abusing a client
- f. Assuming duties without sufficient preparation
- g. Knowingly delegating to unlicensed personnel nursing care that places the client at risk for injury
- h. Failure to maintain an accurate record for each client
- i. Falsifying a client's record
- j. Leaving a nursing assignment without properly notifying appropriate personnel

III. Legal Liability

A. Laws

1. Nurses are governed by civil and criminal law in roles as providers of services, employees of institutions, and private citizens.
2. The nurse has a personal and legal obligation to provide a standard of client care expected of a reasonably competent professional nurse.
3. Professional nurses are held responsible (liable) for harm resulting from their negligent acts or their failure to act.

B. Types of laws (Box 6-2; Fig. 6-1)

C. Negligence and malpractice (Box 6-3)

1. Negligence is conduct that falls below the standard of care.
2. Negligence can include acts of commission and acts of omission.
3. The nurse who does not meet appropriate standards of care may be held liable.

BOX 6-2 Types of Law

Contract Law

Contract law is concerned with enforcement of agreements among private individuals.

Civil Law

Civil law is concerned with relationships among persons and the protection of a person's rights. Violation may cause harm to an individual or property, but no grave threat to society exists.

Criminal Law

Criminal law is concerned with relationships between individuals and governments, and with acts that threaten society and its order; a crime is an offense against society that violates a law and is defined as a misdemeanor (less serious nature) or felony (serious nature).

Tort Law

A tort is a civil wrong, other than a breach in contract, in which the law allows an injured person to seek damages from a person who caused the injury.

4. Malpractice is negligence on the part of the nurse.
5. Malpractice is determined if the nurse owed a duty to the client and did not carry out the duty and the client was injured because the nurse failed to perform the duty.
6. Proof of liability
 - a. Duty: At the time of injury, a duty existed between the plaintiff and the defendant.
 - b. Breach of duty: The defendant breached duty of care to the plaintiff.
 - c. Proximate cause: The breach of the duty was the legal cause of injury to the client.

FIGURE 6-1 Sources of law for nursing practice.

BOX 6-3 Examples of Negligent Acts

- Medication errors that result in injury to the client
- Intravenous administration errors, such as incorrect flow rates or failure to monitor a flow rate, that result in injury to the client
- Falls that occur as a result of failure to provide safety to the client
- Failure to use sterile technique when indicated
- Failure to check equipment for proper functioning
- Burns sustained by the client as a result of failure to monitor bath temperature or equipment
- Failure to monitor a client's condition
- Failure to report changes in the client's condition to the health care provider
- Failure to provide a complete report to the oncoming nursing staff

Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby.

- d. Damage or injury: The plaintiff experienced injury or damages or both and can be compensated by law.

 **The nurse must meet appropriate standards of care when delivering care to the client; otherwise the nurse would be held liable if the client is harmed.**

-  D. Professional liability insurance
1. Nurses need their own liability insurance for protection against malpractice lawsuits.
 2. Having their own insurance provides nurses protection as individuals; this allows the nurse to have an attorney, who has only the nurse's interests in mind, present if necessary.
- E. Good Samaritan laws
1. State legislatures pass Good Samaritan laws, which may vary from state to state.
 2. These laws encourage health care professionals to assist in emergency situations and limit liability and offer legal immunity for persons helping in an emergency, provided that they give reasonable care.
 3. Immunity from suit applies only when all conditions of the state law are met, such as that the health care provider (HCP) receives no compensation for the care provided and the care given is not intentionally negligent.
-  F. Controlled substances
1. The nurse should adhere to facility policies and procedures concerning administration of controlled substances, which are governed by federal and state laws.
 2. Controlled substances must be kept locked securely, and only authorized personnel should have access to them.
 3. Controlled substances must be properly signed out for administration and a correct inventory must be maintained.

IV. Collective Bargaining

- A. Collective bargaining is a formalized decision-making process between representatives of management and representatives of labor to negotiate wages and conditions of employment.
- B. When collective bargaining breaks down because the parties cannot reach an agreement, the employees may call a strike or take other work actions.
- C. Striking presents a **moral** dilemma to many nurses because nursing practice is a service to people.

V. Legal Risk Areas

- A. Assault
1. Assault occurs when a person puts another person in fear of a harmful or offensive contact.
 2. The victim fears and believes that harm will result because of the threat.
- B. Battery is an intentional touching of another's body without the other's **consent**.
- C. Invasion of privacy includes violating **confidentiality**, intruding on private client or family matters, and sharing client information with unauthorized persons.
- D. False imprisonment
1. False imprisonment occurs when a client is not allowed to leave a health care facility when there is no legal justification to detain the client.
 2. False imprisonment also occurs when restraining devices are used without an appropriate clinical need.
 3. A client can sign an Against Medical Advice form when the client refuses care and is competent to make decisions.
 4. The nurse should document circumstances in the medical record to avoid allegations by the client that cannot be defended.
- E. Defamation is a false communication that causes damage to someone's reputation, either in writing (libel) or verbally (slander).
- F. Fraud results from a deliberate deception intended to produce unlawful gains.
- G. There may be exceptions to certain legal risks areas, such as assault, battery, and false imprisonment, when caring for a client with a mental health disorder experiencing acute distress who poses a risk to himself or herself or others. In this situation, the nurse must assess the client to determine loss of control and intervene accordingly; the nurse should use the least restrictive methods initially, but then use interventions such as restraint if the client's behavior indicates the need for this intervention.

VI. Client's Rights

- A. Description
1. The client's rights document, also called the **Client's (Patient's) Bill of Rights**, reflects acknowledgment of a client's right to participate in her or his health care with an emphasis on client autonomy.

2. The document provides a list of the rights of the client and responsibilities that the hospital cannot violate (Box 6-4).
 3. The client's rights protect the client's ability to determine the level and type of care received; all health care agencies are required to have a **Client's Bill of Rights** posted in a visible area.
 4. Several laws and standards pertain to client's rights (Box 6-5).
- B. Rights for the mentally ill (Box 6-6)
1. The Mental Health Systems Act created rights for mentally ill people.
 2. The Joint Commission has developed policy statements on the rights of mentally ill people.

BOX 6-4 Client's Rights When Hospitalized

- Right to considerate and respectful care
- Right to be informed about diagnosis, possible treatments, and likely outcome, and to discuss this information with the health care provider
- Right to know the names and roles of the persons who are involved in care
- Right to consent or refuse a treatment
- Right to have an advance directive
- Right to privacy
- Right to expect that medical records are confidential
- Right to review the medical record and to have information explained
- Right to expect that the hospital will provide necessary health services
- Right to know if the hospital has relationships with outside parties that may influence treatment or care
- Right to consent or refuse to take part in research
- Right to be told of realistic care alternatives when hospital care is no longer appropriate
- Right to know about hospital rules that affect treatment, and about charges and payment methods

From Christensen B, Kockrow E: Foundations of nursing, ed 6, St. Louis, 2010, Mosby; and adapted from American Hospital Association: The patient care partnership: understanding expectations, rights and responsibilities. Available at www.aha.org/content/00-10/pcp_english_030730.pdf.

BOX 6-5 Laws and Standards

American Hospital Association

Issued Patient's Bill of Rights

American Nurses Association

Developed the Code of Ethics for Nurses, which defines the nurse's responsibility for upholding client's rights

Mental Health Systems Act

Developed rights for mentally ill clients

The Joint Commission

Developed policy statements on the rights of mentally ill individuals

BOX 6-6 Rights for the Mentally Ill

- Right to be treated with dignity and respect
- Right to communicate with persons outside the hospital
- Right to keep clothing and personal effects with them
- Right to religious freedom
- Right to be employed
- Right to manage property
- Right to execute wills
- Right to enter into contractual agreements
- Right to make purchases
- Right to education
- Right to habeas corpus (written request for release from the hospital)
- Right to an independent psychiatric examination
- Right to civil service status, including the right to vote
- Right to retain licenses, privileges, or permits
- Right to sue or be sued
- Right to marry or divorce
- Right to treatment in the least restrictive setting
- Right not to be subject to unnecessary restraints
- Right to privacy and confidentiality
- Right to informed consent
- Right to treatment and to refuse treatment
- Right to refuse participation in experimental treatments or research

Adapted from Stuart G: Principles and practice of psychiatric nursing, ed 10, St. Louis, 2013, Mosby.

3. Psychiatric facilities are required to have a Client's Bill of Rights posted in a visible area.
- C. Organ donation and transplantation
1. A client has the right to decide to become an organ donor and a right to refuse organ transplantation as a treatment option.
 2. An individual who is at least 18 years old may indicate a wish to become a donor on his or her driver's license (state-specific) or in an **advance directive**.
 3. The Uniform Anatomical Gift Act provides a list of individuals who can provide **informed consent** for the donation of a deceased individual's organs.
 4. The United Network for Organ Sharing sets the criteria for organ donations.
 5. Some organs, such as the heart, lungs, and liver, can be obtained only from a person who is on mechanical ventilation and has suffered brain death, whereas other organs or tissues can be removed several hours after death.
 6. A donor must be free of infectious disease and cancer.
 7. Requests to the deceased's family for organ donation usually are done by the HCP or nurse specially trained for making such requests.
 8. Donation of organs does not delay funeral arrangements; no obvious evidence that the organs were removed from the body shows when

the body is dressed; and the family incurs no cost for removal of the organs donated.

- D. Religious beliefs: Organ donation and transplantation
1. Catholic Church: Organ donation and transplants are acceptable.
 2. Orthodox Church: Church discourages organ donation.
 3. Islam (Muslim) beliefs: Body parts may not be removed or donated for transplantation.
 4. Jehovah's Witness: An organ transplant may be accepted, but the organ must be cleansed with a nonblood solution before transplantation.
 5. Orthodox Judaism
 - a. All body parts removed during autopsy must be buried with the body because it is believed that the entire body must be returned to the earth; organ donation may not be considered by family members.
 - b. Organ transplantation may be allowed with the rabbi's approval.
 6. Refer to [Chapter 5](#) for additional information regarding end-of-life care.

VII. Informed Consent

A. Description

1. Informed consent is the client's approval (or that of the client's legal representative) to have his or her body touched by a specific individual.
2. **Consents**, or releases, are legal documents that indicate the client's permission to perform surgery, perform a treatment or procedure, or give information to a third party.
3. There are different types of consents ([Box 6-7](#)).
4. Informed consent indicates the client's participation in the decision regarding health care.
5. The client must be informed, in understandable terms, of the risks and benefits of the surgery or treatment, what the consequences are for not having the surgery or procedure performed, treatment options, and the name of the health care provider performing the surgery or procedure.
6. A client's questions about the surgery or procedure must be answered before signing the consent.
7. A consent must be signed freely by the client without threat or pressure and must be witnessed (the witness must be an adult).
8. A client who has been medicated with sedating medications or any other medications that can affect the client's cognitive abilities must not be asked to sign a consent.
9. Legally, the client must be mentally and emotionally competent to give consent.
10. If a client is declared mentally or emotionally incompetent, the next of kin, appointed guardian (appointed by the court), or durable power

BOX 6-7 Types of Consents

Admission Agreement

Admission agreements are obtained at the time of admission and identify the health care agency's responsibility to the client.

Immunization Consent

An immunization consent may be required before the administration of certain immunizations; the consent indicates that the client was informed of the benefits and risks of the immunization.

Blood Transfusion Consent

A blood transfusion consent indicates that the client was informed of the benefits and risks of the transfusion. Some clients hold religious beliefs that would prohibit them from receiving a blood transfusion, even in a life-threatening situation.

Surgical Consent

Surgical consent is obtained for all surgical or invasive procedures or diagnostic tests that are invasive. The health care provider, surgeon, or anesthesiologist who performs the operative or other procedure is responsible for explaining the procedure, its risks and benefits, and possible alternative options.

Research Consent

The research consent obtains permission from the client regarding participation in a research study. The consent informs the client about the possible risks, consequences, and benefits of the research.

Special Consents

Special consents are required for the use of restraints, photographing the client, disposal of body parts during surgery, donating organs after death, or performing an autopsy.

BOX 6-8 Mentally or Emotionally Incompetent Clients

- Declared incompetent
- Unconscious
- Under the influence of chemical agents such as alcohol or drugs
- Chronic dementia or other mental deficiency that impairs thought processes and ability to make decisions

of attorney for health care has legal authority to give consent ([Box 6-8](#)).

11. A competent client 18 years of age or older must sign the consent.
12. In most states, when the nurse is involved in the informed consent process, the nurse is witnessing only the signature of the client on the informed consent form.

13. An informed consent can be waived for urgent medical or surgical intervention as long as institutional policy so indicates.
14. A client has the right to refuse information and waive the informed consent and undergo treatment, but this decision must be documented in the medical record.
15. A client may withdraw consent at any time.

 An informed consent is a legal document, and the client must be informed by the HCP (i.e., physician, surgeon), in understandable terms, of the risks and benefits of surgery, treatments, procedures, and plan of care. The client needs to be a participant in decisions regarding health care.

B. Minors

1. A minor is a client under legal age as defined by state statute (usually younger than 18 years).
2. A minor may not give legal consent, and consent must be obtained from a parent or the legal guardian; assent by the minor is important because it allows for communication of the minor's thoughts and feelings.
3. Parental or guardian consent should be obtained before treatment is initiated for a minor except in the following cases: in an emergency; in situations in which the consent of the minor is sufficient, including treatment related to substance abuse, treatment of a sexually transmitted infection, human immunodeficiency virus (HIV) testing and acquired immunodeficiency syndrome (AIDS) treatment, birth control services, pregnancy, or psychiatric services; the minor is an emancipated minor; or a court order or other legal authorization has been obtained. Refer to the Guttmacher Report on Public Policy for additional information: <http://www.guttmacher.org/pubs/tgr/03/4/gr030404.html>.

C. Emancipated minor

1. An emancipated minor has established independence from his or her parents through marriage, pregnancy, or service in the armed forces, or by a court order.
2. An emancipated minor is considered legally capable of signing an informed consent.

VIII. Health Insurance Portability and Accountability Act

A. Description

1. The Health Insurance Portability and Accountability Act (HIPAA) describes how personal health information (PHI) may be used and how the client can obtain access to the information.
2. PHI includes individually identifiable information that relates to the client's past, present, or future health; treatment; and payment for health care services.

3. The act requires health care agencies to keep PHI private, provides information to the client about the legal responsibilities regarding privacy, and explains the client's rights with respect to PHI.
4. The client has various rights as a consumer of health care under HIPAA, and any client requests may need to be placed in writing; a fee may be attached to certain client requests.
5. The client may file a complaint if the client believes that privacy rights have been violated.

B. Client's rights include the right to do the following:

1. Inspect a copy of PHI.
2. Ask the health care agency to amend the PHI that is contained in a record if the PHI is inaccurate.
3. Request a list of disclosures made regarding the PHI as specified by HIPAA.
4. Request to restrict how the health care agency uses or discloses PHI regarding treatment, payment, or health care services, unless information is needed to provide emergency treatment.
5. Request that the health care agency communicate with the client in a certain way or at a certain location; the request must specify how or where the client wishes to be contacted.
6. Request a paper copy of the HIPAA notice.

C. Health care agency use and disclosure of PHI

1. The health care agency obtains PHI in the course of providing or administering health insurance benefits.
2. Use or disclosure of PHI may be done for the following:
 - a. Health care payment purposes
 - b. Health care operations purposes
 - c. Treatment purposes
 - d. Providing information about health care services
 - e. Data aggregation purposes to make health care benefit decisions
 - f. Administering health care benefits
3. There are additional uses or disclosures of PHI (Box 6-9).

IX. Confidentiality/Information Security

A. Description

1. In the health care system, confidentiality/information security refers to the protection of privacy of the client's PHI.
2. Clients have a right to privacy in the health care system.
3. A special relationship exists between the client and nurse, in which information discussed is not shared with a third party who is not directly involved in the client's care.
4. Violations of privacy occur in various ways (Box 6-10).

BOX 6-9 Uses or Disclosures of Personal Health Information

- Compliance with legal proceedings or for limited law enforcement purposes
- To a family member or significant other in a medical emergency
- To a personal representative appointed by the client or designated by law
- For research purposes in limited circumstances
- To a coroner, medical examiner, or funeral director about a deceased person
- To an organ procurement organization in limited circumstances
- To avert a serious threat to the client's health or safety or the health or safety of others
- To a governmental agency authorized to oversee the health care system or government programs
- To the Department of Health and Human Services for the investigation of compliance with the Health Insurance Portability and Accountability Act or to fulfill another lawful request
- To federal officials for lawful intelligence or national security purposes
- To protect health authorities for public health purposes
- To appropriate military authorities if a client is a member of the armed forces
- In accordance with a valid authorization signed by the client

Adapted from U.S. Department of Health and Human Services Office for Civil Rights: Health information privacy. Available at <http://www.hhs.gov/ocr/privacy/>.

BOX 6-10 Violations and Invasion of Client Privacy

- Taking photographs of the client
- Release of medical information to an unauthorized person, such as a member of the press, family, friend, or neighbor of the client, without the client's permission
- Use of the client's name or picture for the health care agency's sole advantage
- Intrusion by the health care agency regarding the client's affairs
- Publication of information about the client or photographs of the client, including on a social networking site
- Publication of embarrassing facts
- Public disclosure of private information
- Leaving the curtains or room door open while a treatment or procedure is being performed
- Allowing individuals to observe a treatment or procedure without the client's consent
- Leaving a confused or agitated client sitting in the nursing unit hallway
- Interviewing a client in a room with only a curtain between clients or where conversation can be overheard
- Accessing medical records when unauthorized to do so

B. Nurse's responsibility

1. Nurses are bound to protect client **confidentiality** by most nurse practice acts, by **ethical principles** and standards, and by institutional and agency policies and procedures.
2. Disclosure of confidential information exposes the nurse to liability for invasion of the client's privacy.
3. The nurse needs to protect the client from indiscriminate disclosure of health care information that may cause harm (**Box 6-11**).

C. Social networks and health care (**Box 6-12**)

D. Medical records

1. Medical records are confidential.
2. The client has the right to read the medical record and have copies of the record.
3. Only staff members directly involved in care have legitimate access to a client's record; these may include HCPs and nurses caring for the client, technicians, therapists, social workers, unit secretaries, client advocates, and administrators (e.g., for statistical analysis, staffing, quality care review). Others must ask permission from the client to review a record.

BOX 6-11 Maintenance of Confidentiality

- Not discussing client issues with other clients or staff uninvolved in the client's care
- Not sharing health care information with others without the client's consent (includes family members or friends of the client and social networking sites)
- Keeping all information about a client private, and not revealing it to someone not directly involved in care
- Discussing client information only in private and secluded areas
- Protecting the medical record from all unauthorized readers

BOX 6-12 Social Networking and Health Care

- Specific social networking sites can be beneficial to health care providers (HCPs) and clients; misuse of social networking sites by the HCP can lead to Health Insurance Portability and Accountability Act (HIPAA) violations and subsequent termination of the employee.
- Nurses need to adhere to the code of ethics, confidentiality rules, and social media rules. Additional information about these codes and rules can be located at the American Nurses Association Web site at <http://www.nursingworld.org/FunctionalMenuCategories/AboutANA/Social-Media/Social-Networking-Principles-Toolkit>.
- Standards of professionalism need to be maintained and any information obtained through any nurse-client relationship cannot be shared in any way.
- The nurse is responsible for reporting any identified breach of privacy or confidentiality.

4. The medical record is stored in the records or the health information department after discharge of the client from the health care facility.
- E. Information technology/computerized medical records
1. Health care employees should have access only to the client's records in the nursing unit or work area.
 2. Confidentiality/information security can be protected by the use of special computer access codes to limit what employees have access to in computer systems.
 3. The use of a password or identification code is needed to enter and sign off a computer system.
 4. A password or identification code should never be shared with another person.
 5. Personal passwords should be changed periodically to prevent unauthorized computer access.
- F. When conducting research, any information provided by the client is not to be reported in any manner that identifies the client and is not to be made accessible to anyone outside the research team.

 **The nurse must always protect client confidentiality.**

X. Legal Safeguards

A. Risk management

1. Risk management is a planned method to identify, analyze, and evaluate risks, followed by a plan for reducing the frequency of accidents and injuries.
2. Programs are based on a systematic reporting system for incidents or unusual occurrences.

B. Incident reports (Box 6-13)

1. The incident report is used as a means of identifying risk situations and improving client care.
2. Follow specific documentation guidelines.
3. Fill out the report completely, accurately, and factually.
4. The report form should not be copied or placed in the client's record.
5. Make no reference to the incident report form in the client's record.

6. The report is not a substitute for a complete entry in the client's record regarding the incident.
 7. If a client injury or error in care occurred, assess the client frequently.
 8. The health care provider must be notified of incident and the client's condition.
- C. Safeguarding valuables
1. Client's valuables should be given to a family member or secured for safekeeping in a stored and locked designated location, such as the agency's safe; the location of the client's valuables should be documented per agency policy.
 2. Many health care agencies require a client to sign a release to free the agency of the responsibility for lost valuables.
 3. A client's wedding band can be taped in place unless a risk exists for swelling of the hands or fingers.
 4. Religious items, such as medals, may be pinned to the client's gown if allowed by agency policy.

D. HCP's prescriptions

1. The nurse is obligated to carry out an HCP's prescription except when the nurse believes a prescription to be inappropriate or inaccurate.
2. The nurse carrying out an inaccurate prescription may be legally responsible for any harm suffered by the client.
3. If no resolution occurs regarding the prescription in question, the nurse should contact the nurse manager or supervisor.
4. The nurse should follow specific guidelines for telephone prescriptions (Box 6-14).
5. The nurse should ensure that all components of a medication prescription are documented (Box 6-15).

 **The nurse should never carry out a prescription if it is unclear or inappropriate. The HCP should be contacted immediately.**

E. Documentation

1. Documentation is legally required by accrediting agencies, state licensing laws, and state nurse and medical practice acts.

BOX 6-13 Examples of Incidents That Need to Be Reported

- Accidental omission of prescribed therapies
- Circumstances that led to injury or a risk for client injury
- Client falls
- Medication administration errors
- Needle-stick injuries
- Procedure-related or equipment-related accidents
- A visitor injury that occurred on the health care agency premises
- A visitor who exhibits symptoms of a communicable disease

BOX 6-14 Telephone Prescription Guidelines

- Date and time the entry.
- Repeat the prescription to the health care provider (HCP), and record the prescription.
- Sign the prescription; begin with "t.o." (telephone order), write the HCP's name, and sign the prescription.
- If another nurse witnessed the prescription, that nurse's signature follows.
- The HCP needs to countersign the prescription within a timeframe according to agency policy.

BOX 6-15 Components of a Medication Prescription

- Date and time prescription was written
- Medication name
- Medication dosage
- Route of administration
- Frequency of administration
- Health care provider's signature

2. The nurse should follow agency guidelines and procedures (Box 6-16).
3. Refer to The Joint Commission Web site for acceptable abbreviations and documentation guidelines: http://www.jointcommission.org/standards_information/npsgs.aspx.

F. Client and family teaching

1. Provide complete instructions in a language that the client or family can understand.
2. Document client and family teaching, what was taught, evaluation of understanding, and who was present during the teaching.
3. Inform the client of what could happen if information shared during teaching is not followed.

BOX 6-16 Do's and Don'ts Documentation Guidelines: Narrative and Information Technology

- Use a black-colored ink pen for narrative documentation.
- Date and time entries.
- Provide objective, factual, and complete documentation.
- Document care, medications, treatments, and procedures as soon as possible after completion.
- Document client responses to interventions.
- Document consent for or refusal of treatments.
- Document calls made to other health care providers.
- Use quotes as appropriate for subjective data.
- Use correct spelling, grammar, and punctuation.
- Sign and title each entry.
- Follow agency policies when an error is made (i.e., draw 1 line through the error, initial, and date).
- Follow agency guidelines regarding late entries.
- Use only the user identification code, name, or password for computerized documentation.
- Maintain privacy and confidentiality of documented information printed from the computer.
- Do not document for others or change documentation for other individuals.
- Do not use unacceptable abbreviations.
- Do not use judgmental or evaluative statements, such as "uncooperative client."
- Do not leave blank spaces on documentation forms.
- Do not lend access identification computer codes to another person; change password at regular intervals.

XI. Advance Directives

A. Client (Patient) Self-Determination Act

1. The Client (Patient) Self-Determination Act is a law that indicates clients must be provided with information about their rights to identify written directions about the care that they wish to receive in the event that they become incapacitated and are unable to make health care decisions.
2. On admission to a health care facility, the client is asked about the existence of an advance directive, and if one exists, it must be documented and included as part of the medical record; if the client signs an advance directive at the time of admission, it must be documented in the client's medical record.
3. The 2 basic types of advance directives include instructional directives and durable power of attorney for health care.
 - a. Instructional directives: Lists the medical treatment that a client chooses to omit or refuse if the client becomes unable to make decisions and is terminally ill.
 - b. Durable power of attorney for health care: Appoints a person (health care proxy) chosen by the client to make health care decisions on the client's behalf when the client can no longer make decisions.

B. Do not resuscitate (DNR) orders

1. A DNR order should be written if the client and health care provider have made the decision that the client's health is deteriorating and the client chooses not to undergo cardiopulmonary resuscitation if needed.
2. The client or his or her legal representative must provide **informed consent** for the DNR status.
3. The DNR order must be defined clearly so that other treatment, not refused by the client, will be continued.
4. Some states offer DNR Comfort Care and DNR Comfort Care Arrest protocols; these protocols list specific actions that HCPs will take when providing cardiopulmonary resuscitation (CPR).
5. All health care personnel must know whether a client has a DNR order; if a client does not have a DNR order, HCPs need to make every effort to revive the client.
6. A DNR order needs to be reviewed regularly according to agency policy and may need to be changed if the client's status changes.
7. DNR protocols may vary from state to state, and it is important for the nurse to know his or her state's protocols.

C. The nurse's role

1. Discussing advance directives with the client opens the communication channel to establish what is important to the client and what the client may view as promoting life versus prolonging dying.

2. The nurse needs to ensure that the client has been provided with information about the right to identify written directions about the care that the client wishes to receive.
3. On admission to a health care facility, the nurse determines whether an advance directive exists and ensures that it is part of the medical record; the nurse also offers information about advance directives if the client indicates he or she wants more information.
4. The nurse ensures that the HCP is aware of the presence of an advance directive.
5. All health care workers need to follow the directions of an advance directive to be safe from liability.
6. Some agencies have specific policies that prohibit the nurse from signing as a witness to a legal document, such as an instructional directive.
7. If allowed by the agency, when the nurse acts as a witness to a legal document, the nurse must document the event and the factual circumstances surrounding the signing in the medical record; documentation as a witness should include who was present, any significant comments by the client, and the nurse's observations of the client's conduct during this process.

3. Follow agency policies and procedures to handle reporting a concern or complaint.

CRITICAL THINKING What Should You Do?

Answer: If the client indicates that he or she does not want a prescribed therapy, treatment, or procedure such as surgery, the nurse should further investigate the client's request. If the client indicates that he or she has changed his or her mind about surgery, the nurse should assess the client and explore with the client his or her concerns about not wanting the surgery. The nurse would then withhold further surgical preparation and contact the surgeon to report the client's request so that the surgeon can discuss the consequences of not having the surgery with the client. Under no circumstances would the nurse continue with surgical preparation if the client has indicated that he or she does not want the surgery. Further assessment and follow-up related to the client's request need to be done. In addition, it is the client's right to refuse treatment.

References: Lewis et al. (2014), p. 326. Perry, Potter, Ostendorf (2014), p. 882.

XII. Reporting Responsibilities

- A. Nurses are required to report certain communicable diseases or criminal activities such as child or elder abuse or domestic violence; dog bite or other animal bite, gunshot or stab wounds, assaults, and homicides; and suicides to the appropriate authorities.
- B. Impaired nurse
 1. If the nurse suspects that a co-worker is abusing chemicals and potentially jeopardizing a client's safety, the nurse must report the individual to the nursing supervisor/nursing administration in a confidential manner. (Client safety is always the first priority.)
 2. Nursing administration notifies the board of nursing regarding the nurse's behavior.
 3. Many institutions have policies that allow for drug testing if impairment is suspected.
- C. Occupational Safety and Health Act (OSHA)
 1. OSHA requires that an employer provide a safe workplace for employees according to regulations.
 2. Employees can confidentially report working conditions that violate regulations.
 3. An employee who reports unsafe working conditions cannot be retaliated against by the employer.
- D. Sexual harassment
 1. Sexual harassment is prohibited by state and federal laws.
 2. Sexual harassment includes unwelcome conduct of a sexual nature.

PRACTICE QUESTIONS

13. The nurse hears a client calling out for help, hurries down the hallway to the client's room, and finds the client lying on the floor. The nurse performs an assessment, assists the client back to bed, notifies the health care provider of the incident, and completes an incident report. Which statement should the nurse document on the incident report?
 1. The client fell out of bed.
 2. The client climbed over the side rails.
 3. The client was found lying on the floor.
 4. The client became restless and tried to get out of bed.
14. A client is brought to the emergency department by emergency medical services (EMS) after being hit by a car. The name of the client is unknown, and the client has sustained a severe head injury and multiple fractures and is unconscious. An emergency craniotomy is required. Regarding informed consent for the surgical procedure, which is the best action?
 1. Obtain a court order for the surgical procedure.
 2. Ask the EMS team to sign the informed consent.
 3. Transport the victim to the operating room for surgery.
 4. Call the police to identify the client and locate the family.
15. The nurse has just assisted a client back to bed after a fall. The nurse and health care provider have assessed the client and have determined that the client is not

injured. After completing the incident report, the nurse should implement which action next?

1. Reassess the client.
 2. Conduct a staff meeting to describe the fall.
 3. Document in the nurse's notes that an incident report was completed.
 4. Contact the nursing supervisor to update information regarding the fall.
16. The nurse arrives at work and is told to report (float) to the intensive care unit (ICU) for the day because the ICU is understaffed and needs additional nurses to care for the clients. The nurse has never worked in the ICU. The nurse should take which best action?
1. Refuse to float to the ICU based on lack of unit orientation.
 2. Clarify with the team leader to make a safe ICU client assignment.
 3. Ask the nursing supervisor to review the hospital policy on floating.
 4. Submit a written protest to nursing administration, and then call the hospital lawyer.
17. The nurse who works on the night shift enters the medication room and finds a co-worker with a tourniquet wrapped around the upper arm. The co-worker is about to insert a needle, attached to a syringe containing a clear liquid, into the antecubital area. Which is the most appropriate action by the nurse?
1. Call security.
 2. Call the police.
 3. Call the nursing supervisor.
 4. Lock the co-worker in the medication room until help is obtained.
18. A hospitalized client tells the nurse that an instructional directive is being prepared and that the lawyer will be bringing the document to the hospital today for witness signatures. The client asks the nurse for assistance in obtaining a witness to the will. Which is the most appropriate response to the client?
1. "I will sign as a witness to your signature."
 2. "You will need to find a witness on your own."
 3. "Whoever is available at the time will sign as a witness for you."
 4. "I will call the nursing supervisor to seek assistance regarding your request."
- ❖ 19. The nurse has made an error in a narrative documentation of an assessment finding on a client and obtains the client's record to correct the error. The nurse should take which actions to correct the error? Select all that apply.
- 1. Document a late entry in the client's record.
 - 2. Draw 1 line through the error, initialing and dating it.
 - 3. Try to erase the error for space to write in the correct data.
 - 4. Use whiteout to delete the error to write in the correct data.
 - 5. Write a concise statement to explain why the correction was needed.
 - 6. Document the correct information and end with the nurse's signature and title.
- ❖ 20. Which identifies accurate nursing documentation notations? Select all that apply.
- 1. The client slept through the night.
 - 2. Abdominal wound dressing is dry and intact without drainage.
 - 3. The client seemed angry when awakened for vital sign measurement.
 - 4. The client appears to become anxious when it is time for respiratory treatments.
 - 5. The client's left lower medial leg wound is 3 cm in length without redness, drainage, or edema.
21. A nursing instructor delivers a lecture to nursing students regarding the issue of client's rights and asks a nursing student to identify a situation that represents an example of invasion of client privacy. Which situation, if identified by the student, indicates an understanding of a violation of this client right?
1. Performing a procedure without consent
 2. Threatening to give a client a medication
 3. Telling the client that he or she cannot leave the hospital
 4. Observing care provided to the client without the client's permission
22. Nursing staff members are sitting in the lounge taking their morning break. An unlicensed assistive personnel (UAP) tells the group that she thinks that the unit secretary has acquired immunodeficiency syndrome (AIDS) and proceeds to tell the nursing staff that the secretary probably contracted the disease from her husband, who is supposedly a drug addict. The registered nurse should inform the UAP that making this accusation has violated which legal tort?
1. Libel
 2. Slander
 3. Assault
 4. Negligence
23. An 87-year-old woman is brought to the emergency department for treatment of a fractured arm. On physical assessment, the nurse notes old and new ecchymotic areas on the client's chest and legs and asks the client how the bruises were sustained. The client, although reluctant, tells the nurse in confidence that her son frequently hits her if supper is not prepared on time when he arrives home from

work. Which is the most appropriate nursing response?

1. “Oh, really? I will discuss this situation with your son.”
2. “Let’s talk about the ways you can manage your time to prevent this from happening.”
3. “Do you have any friends who can help you out until you resolve these important issues with your son?”
4. “As a nurse, I am legally bound to report abuse. I will stay with you while you give the report and help find a safe place for you to stay.”

24. The nurse calls the health care provider (HCP) regarding a new medication prescription because the dosage prescribed is higher than the recommended dosage. The nurse is unable to locate the HCP, and the medication is due to be administered. Which action should the nurse take?

1. Contact the nursing supervisor.
2. Administer the dose prescribed.
3. Hold the medication until the HCP can be contacted.
4. Administer the recommended dose until the HCP can be located.

25. The nurse employed in a hospital is waiting to receive a report from the laboratory via the facsimile (fax) machine. The fax machine activates and the nurse expects the report, but instead receives a sexually oriented photograph. Which is the most appropriate initial nursing action?

1. Call the police.
2. Cut up the photograph and throw it away.
3. Call the nursing supervisor and report the incident.
4. Call the laboratory and ask for the name of the individual who sent the photograph.

ANSWERS

13. 3

Rationale: The incident report should contain a factual description of the incident, any injuries experienced by those involved, and the outcome of the situation. The correct option is the only one that describes the facts as observed by the nurse. Options 1, 2, and 4 are interpretations of the situation and are not factual information as observed by the nurse.

Test-Taking Strategy: Focus on the **subject**, documentation of events, and note **the data in the question** to select the correct option. Remember to focus on factual information when documenting, and avoid including interpretations. This will direct you to the correct option.

Review: Documentation principles related to **incident reports**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Communication and Documentation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Communication; Health Care Law

Reference: Huber (2014), pp. 318–319.

14. 3

Rationale: In general, there are two situations in which informed consent of an adult client is not needed. One is when an emergency is present and delaying treatment for the purpose of obtaining informed consent would result in injury or death to the client. The second is when the client waives the right to give informed consent. Option 1 will delay emergency treatment, and option 2 is inappropriate. Although option 4 may be pursued, it is not the best action because it delays necessary emergency treatment.

Test-Taking Strategy: Note the **strategic word**, best. Recalling that when an emergency is present and a delay in treatment for the purpose of obtaining informed consent could result in injury or death will direct you to the correct option.

Review: The issues surrounding **informed consent**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Ethics; Health Care Law

References: Potter et al. (2013), pp. 302–303; Zerwekh, Zerwekh Garneau (2015), pp. 475–476.

15. 1

Rationale: After a client’s fall, the nurse must frequently reassess the client because potential complications do not always appear immediately after the fall. The client’s fall should be treated as private information and shared on a “need to know” basis. Communication regarding the event should involve only the individuals participating in the client’s care. An incident report is a problem-solving document; however, its completion is not documented in the nurse’s notes. If the nursing supervisor has been made aware of the incident, the supervisor will contact the nurse if status update is necessary.

Test-Taking Strategy: Note the **strategic word**, next. Using the **steps of the nursing process** will direct you to the correct option. Remember that assessment is the first step. Additionally, use **Maslow’s Hierarchy of Needs theory**, recalling that physiological needs are the priority. The correct option is the only option that addresses a potential physiological need of the client.

Review: Guidelines related to **incident reports** and care to the client after sustaining a **fall**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Communication; Safety

References: Lewis et al. (2014), p. 1682; Zerwekh, Zerwekh Garneau (2015), pp. 479–480.

16. 2

Rationale: Floating is an acceptable practice used by hospitals to solve understaffing problems. Legally, the nurse cannot refuse to float unless a union contract guarantees that nurses can work only in a specified area or the nurse can prove the lack of knowledge for the performance of assigned tasks. When encountering this situation, the nurse should set priorities and identify potential areas of harm to the client. That is why clarifying the client assignment with the team leader to ensure that it is a safe one is the best option. The nursing supervisor is called if the nurse is expected to perform tasks that he or she cannot safely perform. Submitting a written protest and calling the hospital lawyer is a premature action.

Test-Taking Strategy: Note the **strategic word**, best. Eliminate option 1 first because of the word refuse. Next, eliminate options 3 and 4 because they are premature actions.

Review: Nursing responsibilities related to **floating**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Care Coordination; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 589–591.

17. 3

Rationale: Nurse practice acts require reporting impaired nurses. The board of nursing has jurisdiction over the practice of nursing and may develop plans for treatment and supervision of the impaired nurse. This incident needs to be reported to the nursing supervisor, who will then report to the board of nursing and other authorities, such as the police, as required. The nurse may call security if a disturbance occurs, but no information in the question supports this need, and so this is not the appropriate action. Option 4 is an inappropriate and unsafe action.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Eliminate option 4 first because this is an inappropriate and unsafe action. Recall the lines of organizational structure to assist in directing you to the correct option.

Review: The nurse's responsibilities when dealing with an **impaired nurse**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Ethics; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 452–453.

18. 4

Rationale: Instructional directives (living wills) are required to be in writing and signed by the client. The client's signature must be witnessed by specified individuals or notarized. Laws and guidelines regarding instructional directives vary from state to state, and it is the responsibility of the nurse to know the laws. Many states prohibit any employee, including the nurse of a facility where the client is receiving care, from being a witness. Option 2 is nontherapeutic and not a helpful response. The nurse should seek the assistance of the nursing supervisor.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Options 1 and 3 are **comparable or alike** and should be

eliminated first. Option 2 is eliminated because it is a nontherapeutic response.

Review: Legal implications associated with **instructional directives**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Health Care Law; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 420, 476–477.

❖ 19. 2, 6

Rationale: If the nurse makes an error in narrative documentation in the client's record, the nurse should follow agency policies to correct the error. This includes drawing one line through the error, initialing and dating the line, and then documenting the correct information. A late entry is used to document additional information not remembered at the initial time of documentation, not to make a correction of an error. Documenting the correct information with the nurse's signature and title is correct. Erasing data from the client's record and the use of whiteout are prohibited. There is no need to write a statement to explain why the correction was necessary.

Test-Taking Strategy: Focus on the **subject**, correcting a documentation error, and use principles related to documentation. Recalling that alterations to a client's record are to be avoided will assist in eliminating options 3 and 4. From the remaining options, focusing on the **subject** of the question and using knowledge regarding the principles related to documentation will direct you to the correct option.

Review: The principles and guidelines related to **documentation**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Communication and Documentation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Communication; Professionalism

References: Perry, Potter, Ostendorf (2014), p. 51; Zerwekh, Zerwekh Garneau (2015), p. 466.

❖ 20. 1, 2, 5

Rationale: Factual documentation contains descriptive, objective information about what the nurse sees, hears, feels, or smells. The use of inferences without supporting factual data is not acceptable because it can be misunderstood. The use of vague terms, such as seemed or appears, is not acceptable because these words suggest that the nurse is stating an opinion.

Test-Taking Strategy: Focus on the **subject**, accurate documentation notations. Eliminate options 3 and 4 because they are **comparable or alike** and include vague terms (seemed, appears).

Review: **Documentation** guidelines

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Communication and Documentation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Communication; Professionalism

Reference: Perry, Potter, Ostendorf (2014), pp. 50–51.

21. 4

Rationale: Invasion of privacy occurs with unreasonable intrusion into an individual's private affairs. Performing a procedure without consent is an example of battery. Threatening to give a client a medication constitutes assault. Telling the client that the client cannot leave the hospital constitutes false imprisonment.

Test-Taking Strategy: Focus on the **subject**, invasion of privacy. Noting the words without the client's permission will direct you to this option.

Review: Situations that include **invasion of privacy**

Level of Cognitive Ability: Evaluating

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Ethics; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 447, 473–474.

22. 2

Rationale: Defamation is a false communication or a careless disregard for the truth that causes damage to someone's reputation, either in writing (libel) or verbally (slander). An assault occurs when a person puts another person in fear of a harmful or offensive contact. Negligence involves the actions of professionals that fall below the standard of care for a specific professional group.

Test-Taking Strategy: Note the **subject**, the legal tort violated. Focus on the **data in the question** and eliminate options 3 and 4 first because their definitions are unrelated to the data. Recalling that slander constitutes verbal defamation will direct you to the correct option from the remaining options.

Review: The definitions of **libel**, **slander**, **assault**, and **negligence**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Health Care Law; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 448, 473.

23. 4

Rationale: The nurse must report situations related to child or elder abuse, gunshot wounds and other criminal acts, and certain infectious diseases. Confidential issues are not to be discussed with nonmedical personnel or the client's family or friends without the client's permission. Clients should be assured that information is kept confidential, unless it places the nurse under a legal obligation. Options 1, 2, and 3 do not address the legal implications of the situation and do not ensure a safe environment for the client.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **data in the question** and note that an 87-year-old woman is receiving physical abuse by her son. Recall the nursing responsibilities related to client safety and reporting obligations. Options 1, 2, and 3 should be eliminated because they are **comparable or alike** in that they do not protect the client from injury.

Review: The nursing responsibilities related to **reporting responsibilities**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Health Care Law; Interpersonal Violence

References: Lewis et al. (2014), pp. 68–69; Zerwekh, Zerwekh Garneau (2015), p. 472.

24. 1

Rationale: If the HCP writes a prescription that requires clarification, the nurse's responsibility is to contact the HCP. If there is no resolution regarding the prescription because the HCP cannot be located or because the prescription remains as it was written after talking with the HCP, the nurse should contact the nurse manager or nursing supervisor for further clarification as to what the next step should be. Under no circumstances should the nurse proceed to carry out the prescription until obtaining clarification.

Test-Taking Strategy: Eliminate options 2 and 4 first because they are **comparable or alike** and are unsafe actions. Holding the medication can result in client injury. The nurse needs to take action. The correct option clearly identifies the required action in this situation.

Review: Nursing responsibilities related to the **HCP's prescriptions**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), p. 489.

25. 3

Rationale: Ensuring a safe workplace is a responsibility of an employing institution. Sexual harassment in the workplace is prohibited by state and federal laws. Sexually suggestive jokes, touching, pressuring a co-worker for a date, and open displays of or transmitting sexually oriented photographs or posters are examples of conduct that could be considered sexual harassment by another worker. If the nurse believes that he or she is being subjected to unwelcome sexual conduct, these concerns should be reported to the nursing supervisor immediately. Option 1 is unnecessary at this time. Options 2 and 4 are inappropriate initial actions.

Test-Taking Strategy: Note the **strategic words**, most appropriate initial. Remember that using the organizational channels of communication is best. This will assist in directing you to the correct option.

Review: Nursing responsibilities when **sexual harassment** occurs in the workplace

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Health Care Law; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 474–475.

Prioritizing Client Care: Leadership, Delegation, and Emergency Response Planning

PRIORITY CONCEPTS Leadership; Health Care Organizations

CRITICAL THINKING What Should You Do?

The nurse notes that there has been an increase in the number of intravenous (IV) site infections that developed in the clients being cared for on the nursing unit. How should the nurse proceed to implement a quality improvement program?

Answer located on p. 71.

I. Health Care Delivery Systems

A. Managed care

1. Managed care is a broad term used to describe strategies used in the health care delivery system that reduce the costs of health care.
2. Client care is outcome driven and is managed by a case **management** process.
3. Managed care emphasizes the promotion of health, client education and responsible self-care, early identification of disease, and the use of health care resources.

B. Case management

1. Case management is a health care delivery strategy that supports managed care; it uses an inter-professional health care delivery approach that provides comprehensive client care throughout the client's illness, using available resources to promote high-quality and cost-effective care.
2. Case management includes assessment and development of a plan of care, coordination of all services, referral, and follow-up.
3. Critical pathways are used, and variation analysis is conducted.

 **Case management involves consultation and collaboration with an interprofessional health care team.**

C. Case manager

1. A case manager is a professional nurse who assumes responsibility for coordinating the client's care at admission and after discharge.
2. The case manager establishes a plan of care with the client, coordinates any interprofessional consultations and referrals, and facilitates discharge.

D. Critical pathway

1. A critical pathway is a clinical management care plan for providing client-centered care and for planning and monitoring the client's progress within an established time frame; **interprofessional collaboration** and teamwork ensure shared decision making and quality client care.
2. Variation analysis is a continuous process that the case manager and other caregivers conduct by comparing the specific client outcomes with the expected outcomes described on the critical pathway.
3. The goal of a critical pathway is to anticipate and recognize negative variance (i.e., client problems) early so that appropriate action can be taken and positive client outcomes can result.

E. Nursing care plan

1. A nursing care plan is a written guideline and communication tool that identifies the client's pertinent assessment data, problems and nursing diagnoses, goals, interventions, and expected outcomes.
2. The plan enhances interprofessional continuity of care by identifying specific nursing actions necessary to achieve the goals of care.
3. The client and family are involved in developing the plan of care, and the plan identifies short-term and long-term goals.

4. Client problems, goals, interventions, and expected outcomes are documented in the care plan, which provides a framework for evaluation of the client's response to nursing actions.

II. Nursing Delivery Systems

A. Functional nursing

1. Functional nursing involves a task approach to client care, with tasks being delegated by the charge nurse to individual members of the team.
2. This type of system is task-oriented, and the team member focuses on the delegated task rather than the total client; this results in fragmentation of care and lack of **accountability** by the team member.

B. Team nursing

1. The team generally is led by a registered nurse (team leader) who is responsible for assessing clients, analyzing client data, planning, and evaluating each client's plan of care.
2. The team leader determines the work assignment; each staff member works fully within the realm of his or her educational and clinical expertise and job description.
3. Each staff member is accountable for client care and outcomes of care delivered in accordance with the licensing and practice scope as determined by health care agency policy and state law.
4. Modular nursing is similar to team nursing, but takes into account the structure of the unit; the unit is divided into modules, allowing nurses to care for a group of clients who are geographically close by.

C. Relationship-based practice (primary nursing)

1. Relationship-based practice (primary nursing) is concerned with keeping the nurse at the bedside, actively involved in client care, while planning goal-directed, individualized care.
2. One (primary) nurse is responsible for managing and coordinating the client's care while in the hospital and for discharge, and an associate nurse cares for the client when the primary nurse is off-duty.

D. Client-focused care

1. This is also known as the total care or case method; the registered nurse assumes total responsibility for planning and delivering care to a client.
2. The client may have different nurses assigned during a 24-hour period; the nurse provides all necessary care needed for the assigned time period.

III. Professional Responsibilities

A. Accountability

1. The process in which individuals have an obligation (or duty) to act and are answerable for their actions.

2. Involves assuming only the responsibilities that are within one's scope of practice and not assuming responsibility for activities in which competence has not been achieved.
3. Involves admitting mistakes rather than blaming others and evaluating the outcomes of one's own actions.
4. Includes a responsibility to the client to be competent, providing nursing care in accordance with standards of nursing practice and adhering to the professional ethics codes.

 **Accountability is the acceptance of responsibility for one's actions. The nurse is always responsible for his or her actions when providing care to a client.**

B. Leadership and management

1. Leadership is the interpersonal process that involves influencing others (followers) to achieve goals.
2. Management is the accomplishment of tasks or goals by oneself or by directing others.

C. Theories of leadership and management (Box 7-1)

D. Leader and manager approaches

1. Autocratic
 - a. The leader or manager is focused and maintains strong control, makes decisions, and addresses all problems.
 - b. The leader or manager dominates the group and commands rather than seeks suggestions or input.
2. Democratic
 - a. This is also called participative management.
 - b. It is based on the belief that every group member should have input into problem solving and the development of goals; leader obtains participation from group and then makes best decision for the organization, based upon the input from group.

BOX 7-1 Theories of Leadership and Management

Charismatic: Based on personal beliefs and characteristics

Quantum: Based on the concepts of chaos theory; maintaining a balance between tension and order prevents an unstable environment and promotes creativity

Relational: Based on collaboration and teamwork

Servant: Based on a desire to serve others; the leader emerges when another's needs assume priority

Shared: Based on the belief that several individuals share the responsibility for achieving the health care agency's goals

Transactional: Based on the principles of social exchange theory

Transformational: Based on the individual's commitment to the health care agency's vision; focuses on promoting change

- c. The democratic style is a more “talk with the members” style and much less authoritarian than the autocratic style.
- 3. Laissez-faire
 - a. A laissez-faire leader or manager assumes a passive, nondirective, and inactive approach and relinquishes part or all of the responsibilities to the members of the group.
 - b. Decision making is left to the group, with the laissez-faire leader or manager providing little, if any, guidance, support, or feedback.
- 4. Situational
 - a. Situational style uses a combination of styles based on the current circumstances and events.
 - b. Situational styles are assumed according to the needs of the group and the tasks to be achieved.
- 5. Bureaucratic
 - a. The leader or manager believes that individuals are motivated by external forces.
 - b. The leader or manager relies on organizational policies and procedures for decision making.
- E. Effective leader and manager behaviors and qualities ([Box 7-2](#))
- F. Functions of management ([Box 7-3](#))
- G. Problem-solving process and decision making
 - 1. Problem solving involves obtaining information and using it to reach an acceptable solution to a problem.

BOX 7-2 Effective Leader and Manager Behaviors and Qualities

Behaviors

Treats employees as unique individuals
 Inspires employees and stimulates critical thinking
 Shows employees how to think about old problems in new ways and assists with adapting to change
 Is visible to employees; is flexible; and provides guidance, assistance, and feedback
 Communicates a vision, establishes trust, and empowers employees
 Motivates employees to achieve goals

Qualities

Effective communicator; promotes interprofessional collaboration
 Credible
 Critical thinker
 Initiator of action
 Risk taker
 Is persuasive and influences employees

Adapted from Huber D: Leadership and nursing care management, ed 5, Philadelphia, 2014, Saunders.

BOX 7-3 Functions of Management

Planning: Determining objectives and identifying methods that lead to achievement of objectives
 Organizing: Using resources (human and material) to achieve predetermined outcomes
 Directing: Guiding and motivating others to meet expected outcomes
 Controlling: Using performance standards as criteria for measuring success and taking corrective action

TABLE 7-1 Similarities of the Problem-Solving Process and the Nursing Process

Problem-Solving Process	Nursing Process
Identifying a problem and collecting data about the problem	Assessment
Determining the exact nature of the problem	Analysis
Deciding on a plan of action	Planning
Carrying out the plan	Implementation
Evaluating the plan	Evaluation

- 2. Decision making involves identifying a problem and deciding which alternatives can best achieve objectives.
- 3. Steps of the problem-solving process are similar to the steps of the nursing process ([Table 7-1](#)).
- H. Types of managers
 - 1. Frontline manager
 - a. Frontline managers function in supervisory roles of those involved with delivery of client care.
 - b. Frontline roles usually include charge nurse, team leader, and client care coordinator.
 - c. Frontline managers coordinate the activity of all staff who provide client care and supervise team members during the manager’s period of accountability.
 - 2. Middle manager
 - a. Middle manager roles usually include unit manager and supervisor.
 - b. A middle manager’s responsibilities may include supervising staff, preparing budgets, preparing work schedules, writing and implementing policies that guide client care and unit operations, and maintaining the quality of client services.
 - 3. Nurse executive
 - a. The nurse executive is a top-level nurse manager and may be the director of nursing services or the vice president for client care services.

- b. The nurse executive supervises numerous departments and works closely with the administrative team of the organization.
- c. The nurse executive ensures that all client care provided by nurses is consistent with the objectives of the health care organization.

IV. Power

- A. Power is the ability to do or act to achieve desired results.
- B. Powerful people are able to modify behavior and influence others to change, even when others are resistant to change.
- C. Effective nurse leaders use power to improve the delivery of care and to enhance the profession.
- D. There are different types of power (Box 7-4).

V. Empowerment

- A. Empowerment is an interpersonal process of enabling others to do for themselves.
- B. Empowerment occurs when individuals are able to influence what happens to them more effectively.
- C. Empowerment involves open communication, mutual goal setting, and decision making.
- D. Nurses can empower clients through teaching and advocacy.

VI. Formal Organizations

- A. An organization's mission statement communicates in broad terms its reason for existence; the geographical area that the organization serves; and attitudes, beliefs, and values from which the organization functions.
- B. Goals and objectives are measurable activities specific to the development of designated services and programs of an organization.
- C. The organizational chart depicts and communicates how activities are arranged, how authority relationships are defined, and how communication channels are established.
- D. Policies, procedures, and protocols
 - 1. Policies are guidelines that define the organization's standpoint on courses of action.

BOX 7-4 Types of Power

Reward: Ability to provide incentives
 Coercive: Ability to punish
 Referent: Based on attraction
 Expert: Based on having an expert knowledge foundation and skill level
 Legitimate: Based on a position in society
 Personal: Derived from a high degree of self-confidence
 Informational: When one person provides explanations why another should behave in a certain way

- 2. Procedures are based on policy and define methods for tasks.
- 3. Protocols prescribe a specific course of action for a specific type of client or problem.
 - a. Centralization is the making of decisions by a few individuals at the top of the organization or by managers of a department or unit, and decisions are communicated thereafter to the employees.
 - b. Decentralization is the distribution of authority throughout the organization to allow for increased responsibility and delegation in decision making; decentralization tries to move the decision-making as close to the client as possible.

 The nurse must follow policies, procedures, and protocols of the health care agency in which he or she is employed.

VII. Evidence-Based Practice

- A. Research is an important role of the professional nurse. Research provides a foundation for improvement in nursing practice.
- B. Evidence-based practice is an approach to client care in which the nurse integrates the client's preferences, clinical expertise, and the best research evidence to deliver quality care.
- C. Determining the client's personal, social, cultural, and religious preferences ensures individualization and is a component of implementing evidence-based practice.
- D. The nurse needs to be an observer and identify and question situations that require change or result in a less than desirable outcome.
- E. Use of information technology such as online resources, including research publications, provides current research findings related to areas of practice.
- F. The nurse needs to follow evidence-based practice protocols developed by the institution and question the rationale for nursing approaches identified in the protocols as necessary. The nurse should use appropriate evaluation criteria when determining areas in need of research (Table 7-2).

 Evidence-based practice requires that the nurse base nursing practice on the best and most applicable evidence from clinical research studies. The nurse should also be alert to clinical issues that warrant investigation and develop a researchable problem about the issue.

VIII. Quality Improvement

- A. Also known as performance improvement, quality improvement focuses on processes or systems that significantly contribute to client safety and effective client care outcomes; criteria are used to monitor

TABLE 7-2 Evaluation Criteria for Evidence for Clinical Questions

Level	Definition
Level I	Evidence comes from a review of a number of randomized controlled trials (RCTs) or from clinical practice guidelines that are based on such a review.
Level II	Evidence comes from at least one well-designed RCT.
Level III	Evidence comes from well-designed controlled studies that are not randomized.
Level IV	Evidence comes from well-designed case-controlled and cohort studies.
Level V	Evidence comes from a number of descriptive or qualitative studies.
Level VI	Evidence comes from a single descriptive or qualitative study.
Level VII	Evidence comes from the opinion of authorities and/or reports of expert committees.

From Zerwekh J, Zerwekh Garneau A: *Nursing today: transition and trends*, ed 8, Philadelphia, 2015, Saunders. Data from Sackett D et al.: *Evidence-based medicine: how to practice and teach EBM*, London, 2000, Churchill Livingstone.

outcomes of care and to determine the need for change to improve the quality of care.

- B. Quality improvement processes or systems may be named quality assurance, continuous quality **management**, or continuous quality improvement.
- C. When quality improvement is part of the philosophy of a health care agency, every staff member becomes involved in ways to improve client care and outcomes.
- D. A retrospective (“looking back”) audit is an evaluation method used to inspect the medical record after the client’s discharge for documentation of compliance with the standards.
- E. A concurrent (“at the same time”) audit is an evaluation method used to inspect compliance of nurses with predetermined standards and criteria while the nurses are providing care during the client’s stay.
- F. Peer review is a process in which nurses employed in an organization evaluate the quality of nursing care delivered to the client.
- G. The quality improvement process is similar to the nursing process and involves an interprofessional approach.
- H. An outcome describes the most positive response to care; comparison of client responses with the expected outcomes indicates whether the interventions are effective, whether the client has progressed, how well standards are met, and whether changes are necessary.
- I. The nurse is responsible for recognizing trends in nursing practice, identifying recurrent problems, and initiating opportunities to improve the quality of care.

! Quality improvement processes improve the quality of care delivery to clients and the safety of health care agencies.

IX. Change Process

- A. Change is a dynamic process that leads to an alteration in behavior.
 1. Lewin’s basic concept of the change process includes 3 elements for successful change: unfreezing, moving and changing, and refreezing (Fig. 7-1).
 - a. Unfreezing is the first phase of the process, during which the problem is identified and individuals involved gather facts and evidence supporting a basis for change.
 - b. During the moving and changing phase, change is planned and implemented.
 - c. Refreezing is the last phase of the process, during which the change becomes stabilized.
 2. **Leadership** style influences the approach to initiating the change process.
- B. Types of change
 1. Planned change: A deliberate effort to improve a situation
 2. Unplanned change: Change that is unpredictable but is beneficial and may go unnoticed
- C. Resistance to change (**Box 7-5**)
 1. Resistance to change occurs when an individual rejects proposed new ideas without critically thinking about the proposal.
 2. Change requires energy.
 3. The change process does not guarantee positive outcomes.
- D. Overcoming barriers
 1. Create a flexible and adaptable environment.
 2. Encourage the people involved to plan and set goals for change.
 3. Include all involved in the plan for change.
 4. Focus on the benefits of the change in relation to improvement of client care.
 5. Delineate the drawbacks from failing to make the change in relation to client care.
 6. Evaluate the change process on an ongoing basis, and keep everyone informed of progress.
 7. Provide positive feedback to all involved.
 8. Commit to the time it takes to change.

FIGURE 7-1 Elements of a successful change.

BOX 7-5 Reasons for Resisting Change**Conformity**

One goes along with others to avoid conflict.

Dissimilar Beliefs and Values

Differences can impede positive change.

Habit

Routine, set behaviors are often hard to change.

Secondary Gains

Benefits or payoff are present, so there is no incentive to change.

Threats to Satisfying Basic Needs

Change may be perceived as a threat to self-esteem, security, or survival.

Fear

One fears failure or has fear of the unknown.

X. Conflict

- A. Conflict arises from a perception of incompatibility or difference in beliefs, attitudes, values, goals, priorities, or decisions.
- B. Types of conflict
 1. Intrapersonal: Occurs within a person
 2. Interpersonal: Occurs between and among clients, nurses, or other staff members
 3. Organizational: Occurs when an employee confronts the policies and procedures of the organization
- C. Modes of conflict resolution
 1. Avoidance
 - a. Avoiders are unassertive and uncooperative.
 - b. Avoiders do not pursue their own needs, goals, or concerns, and they do not assist others to pursue theirs.
 - c. Avoiders postpone dealing with the issue.
 2. Accommodation
 - a. Accommodators neglect their own needs, goals, or concerns (unassertive) while trying to satisfy those of others.
 - b. Accommodators obey and serve others and often feel resentment and disappointment because they “get nothing in return.”
 3. Competition
 - a. Competitors pursue their own needs and goals at the expense of others.
 - b. Competitors also may stand up for rights and defend important principles.
 4. Compromise
 - a. Compromisers are assertive and cooperative.
 - b. Compromisers work creatively and openly to find the solution that most fully satisfies all important goals and concerns to be achieved.

XI. Roles of Health Care Team Members

- A. Nurse roles are as follows:
 1. Promote health and prevent disease
 2. Provide comfort and care to clients
 3. Make decisions
 4. Act as client advocate
 5. Lead and manage the nursing team
 6. Serve as case manager
 7. Function as a rehabilitator
 8. Communicate effectively
 9. Educate clients, families, and communities and health care team members
 10. Act as a resource person
 11. Allocate resources in a cost-effective manner
- B. Health care provider (HCP): An HCP diagnoses and treats disease.
- C. HCP assistant
 1. An HCP assistant (also known as physician assistant) acts to a limited extent in the role of the HCP during the HCP’s absence.
 2. The HCP assistant conducts physical examinations, performs diagnostic procedures, assists in the operating room and emergency department, and performs treatments.
 3. Certified and licensed HCP assistants in some states have prescriptive powers.
- D. Nurse practitioner: an advanced practice registered nurse (APRN) who is educated to diagnose and treat acute illness and chronic conditions; health promotion and maintenance is a focus.
- E. Physical therapist: A physical therapist assists in examining, testing, and treating physically disabled clients.
- F. Occupational therapist: An occupational therapist develops adaptive devices that help chronically ill or handicapped clients to perform activities of daily living.
- G. Respiratory therapist: A respiratory therapist delivers treatments designed to improve the client’s ventilation and oxygenation status.
- H. Speech therapist: A speech therapist evaluates a client’s ability to swallow safely and effectively and communicates a plan to improve a client’s swallowing ability.
- I. Nutritionist: A nutritionist or dietitian assists in planning dietary measures to improve or maintain a client’s nutritional status.
- J. Continuing care nurse: This nurse coordinates discharge plans for the client.
- K. Assistive personnel, including unlicensed assistive personnel and client care technicians, help the registered nurse with specified tasks and functions.
- L. Pharmacist: A pharmacist formulates and dispenses medications.
- M. Social worker: A social worker counsels clients and families about home care services and assists the continuing care nurse with planning discharge.

- N. Chaplain: A chaplain (or trained layperson) offers spiritual support and guidance to clients and families.
- O. Administrative staff: Administrative or support staff members organize and schedule diagnostic tests and procedures and arrange for services needed by the client and family.

XII. Interprofessional Collaboration

- A. Client care planning can be accomplished through referrals to or consultations or **interprofessional collaborations** with other health care specialists and through client care conferences, which involve members from all health care disciplines. This approach helps to ensure continuity of care.

B. Reports

1. Reports should be factual, accurate, current, complete, and organized.
2. Reports should include essential background information, subjective data, objective data, any changes in the client's status, client problems or nursing diagnoses as appropriate, treatments and procedures, medication administration, client teaching, discharge planning, family information, the client's response to treatments and procedures, and the client's priority needs.
3. Change of shift report
 - a. The report facilitates continuity of care among nurses who are responsible for a client.
 - b. The report may be written, oral, audiotaped, or provided during walking rounds at the client's bedside.
 - c. The report describes the client's health status and informs the nurse on the next shift about the client's needs and priorities for care.
4. Telephone reports
 - a. Purposes include informing an HCP of a client's change in status, communicating information about a client's transfer to or from another unit or facility, and obtaining results of laboratory or diagnostic tests.
 - b. The telephone report should be documented and should include when the call was made, who made the call, who was called, to whom information was given, what information was given, and what information was received.
5. Transfer reports
 - a. Transferring nurse reports provide continuity of care and may be given by telephone or in person (**Box 7-6**).
 - b. Receiving nurse should repeat transfer information to ensure client safety and ask questions to clarify information about the client's status.
6. Situation, Background, Assessment, Recommendation (SBAR)

BOX 7-6 Transfer Reports

- Client's name, age, health care provider, and diagnoses
- Current health status and plan of care
- Client's needs and priorities for care
- Any assessments or interventions that need to be performed after transfer, such as laboratory tests, medication administration, or dressing changes
- Need for any special equipment
- Additional considerations such as allergies, resuscitation status, precautionary considerations, cultural or religious issues, or family issues

- a. SBAR is a structured and standardized communication technique that improves communication among team members when sharing information on a client.
- b. SBAR includes up-to-date information about the client's situation, associated background information, assessment data, and recommendations for care, such as treatments, medications, or services needed.

XIII. Interprofessional Consultation

- A. Consultation is a process in which a specialist is sought to identify methods of care or treatment plans to meet the needs of a client.
- B. Consultation is needed when the nurse encounters a problem that cannot be solved using nursing knowledge, skills, and available resources.
- C. Consultation also is needed when the exact problem remains unclear; a consultant can objectively and more clearly assess and identify the exact nature of the problem.
- D. Rapid response teams are being developed within hospitals to provide nursing staff with internal consultative services provided by expert clinicians.
- E. Rapid response teams are used to assist nursing staff with early detection and resolution of client problems.
- F. Medication reconciliation includes collaboration among the client, HCPs, nurses, and pharmacists to ensure medication accuracy when clients experience changes in health care settings or levels of care or are transferred from one care unit to another, and upon discharge (**Box 7-7**).

BOX 7-7 Process for Medication Reconciliation

1. Obtain a list of current medications from the client.
2. Develop an accurate list of newly prescribed medications.
3. Compare new medications to the list of current medications.
4. Identify and investigate any discrepancies and collaborate with the health care provider as necessary.
5. Communicate the finalized list with the client, caregivers, health care provider, and other team members.

XIV. Discharge Planning

- A. Discharge planning begins when the client is admitted to the hospital or health care facility.
- B. Discharge planning is an interprofessional process that ensures that the client has a plan for continuing care after leaving the health care facility and assists in the client's transition from one environment to another.
- C. All caregivers need to be involved in discharge planning, and referrals to other HCPs or agencies may be needed. An HCP's prescription may be needed for the referral, and the referral needs to be approved by the client's health care insurer.
- D. The nurse should anticipate the client's discharge needs and make the referral as soon as possible (involving the client and family in the referral process).
- E. The nurse needs to educate the client and family regarding care at home (Box 7-8).

XV. Delegation and Assignments

A. Delegation

1. Delegation is a process of transferring performance of a selected nursing task in a situation to an individual who is competent to perform that specific task.
2. Delegation involves achieving outcomes and sharing activities with other individuals who have the authority to accomplish the task.
3. The nurse practice act and any practice limitations (institutional policies and procedures, and job descriptions of personnel provided by the institution) define which aspects of care can be delegated and which must be performed by a registered nurse.
4. Even though a task may be delegated to someone, the nurse who delegates maintains **accountability** for the task.
5. Only the task, not the ultimate accountability, may be delegated to another.
6. The 5 rights of delegation include the right task, right circumstances, right person, right direction/communication, and right supervision/evaluation.

BOX 7-8 Discharge Teaching

- How to administer prescribed medications
- Side and adverse effects of medications that need to be reported to the health care provider (HCP)
- Prescribed dietary and activity measures
- Complications of the medical condition that need to be reported to the HCP
- How to perform prescribed treatments
- How to use special equipment prescribed for the client
- Schedule for home care services that are planned
- How to access available community resources
- When to obtain follow-up care

 The nurse delegates only tasks for which he or she is responsible. The nurse who delegates is accountable for the task; the person who assumes responsibility for the task is also accountable.

B. Principles and guidelines of delegating (Box 7-9)

C. Assignments

1. Assignment is the transfer of performance of client care activities to specific staff members.
2. Guidelines for client care assignments
 - a. Always ensure client safety.
 - b. Be aware of individual variations in work abilities.
 - c. Determine which tasks can be delegated and to whom.
 - d. Match the task to the delegatee on the basis of the nurse practice act and any practice limitations (institutional policies and procedures, and job descriptions of personnel provided by the institution).
 - e. Provide directions that are clear, concise, accurate, and complete.
 - f. Validate the delegatee's understanding of the directions.
 - g. Communicate a feeling of confidence to the delegatee, and provide feedback promptly after the task is performed.

BOX 7-9 Principles and Guidelines of Delegating

- Delegate the right task to the right delegatee. Be familiar with the experience of the delegates, their scopes of practice, their job descriptions, agency policy and procedures, and the state nurse practice act.
- Provide clear directions about the task and ensure that the delegatee understands the expectations.
- Determine the degree of supervision that may be required.
- Provide the delegatee with the authority to complete the task; provide a deadline for completion of the task.
- Evaluate the outcome of care that has been delegated.
- Provide feedback to the delegatee regarding his or her performance.
- In general, noninvasive interventions, such as skin care, range-of-motion exercises, ambulation, grooming, and hygiene measures, can be assigned to the unlicensed assistive personnel (UAP).
- In general, a licensed practical nurse (LPN) or licensed vocational nurse (LVN) can perform not only the tasks that a UAP can perform, but also certain invasive tasks, such as dressing changes, suctioning, urinary catheterization, and medication administration (oral, subcutaneous, intramuscular, and selected piggyback medications), according to the education and job description of the LPN or LVN. The LPN or LVN can also review with the client teaching plans that were initiated by the registered nurse.
- A registered nurse can perform the tasks that an LPN or LVN can perform and is responsible for assessment and planning care, initiating teaching, and administering medications intravenously.

- h. Maintain continuity of care as much as possible when assigning client care.

XVI. Time Management

A. Description

1. Time management is a technique designed to assist in completing tasks within a definite time period.
2. Learning how, when, and where to use one's time and establishing personal goals and time frames are part of time management.
3. Time management requires an ability to anticipate the day's activities, to combine activities when possible, and to not be interrupted by non-essential activities.
4. Time management involves efficiency in completing tasks as quickly as possible and effectiveness in deciding on the most important task to do (i.e., **prioritizing**) and doing it correctly.

B. Principles and guidelines

1. Identify tasks, obligations, and activities and write them down.
2. Organize the workday; identify which tasks must be completed in specified time frames.
3. Prioritize client needs according to importance.
4. Anticipate the needs of the day and provide time for unexpected and unplanned tasks that may arise.
5. Focus on beginning the daily tasks, working on the most important first while keeping goals in mind; look at the final goal for the day, which helps in the breakdown of tasks into manageable parts.
6. Begin client rounds at the beginning of the shift, collecting data on each assigned client.
7. Delegate tasks when appropriate.
8. Keep a daily hour-by-hour log to assist in providing structure to the tasks that must be accomplished, and cross tasks off the list as they are accomplished.
9. Use health care agency resources wisely, anticipating resource needs, and gather the necessary supplies before beginning the task.
10. Organize paperwork and continuously document task completion and necessary client data throughout the day (i.e., documentation should be concurrent with completion of a task or observation of pertinent client data).
11. At the end of the day, evaluate the effectiveness of time management.

XVII. Prioritizing Care

- A. Prioritizing is deciding which needs or problems require immediate action and which ones could tolerate a delay in response until a later time because they are not urgent.
- B. Guidelines for prioritizing (**Box 7-10**)

BOX 7-10 Guidelines for Prioritizing

- The nurse and the client mutually rank the client's needs in order of importance based on the client's preferences and expectations, safety, and physical and psychological needs; what the client sees as his or her priority needs may be different from what the nurse sees as the priority needs.
- Priorities are classified as high, intermediate, or low.
- Client needs that are life-threatening or that could result in harm to the client if they are left untreated are high priorities.
- Nonemergency and non-life-threatening client needs are intermediate priorities.
- Client needs that are not related directly to the client's illness or prognosis are low priorities.
- When providing care, the nurse needs to decide which needs or problems require immediate action and which ones could be delayed until a later time because they are not urgent.
- The nurse considers client problems that involve actual or life-threatening concerns before potential health-threatening concerns.
- When prioritizing care, the nurse must consider time constraints and available resources.
- Problems identified as important by the client must be given high priority.
- The nurse can use the ABCs—airway—breathing—circulation—as a guide when determining priorities; client needs related to maintaining a patent airway are always the priority.
- If cardiopulmonary resuscitation (CPR) is necessary, the order of priority is CAB—compressions—airway—breathing—this is the exception to using the ABCs when determining priorities.
- The nurse can use Maslow's Hierarchy of Needs theory as a guide to determine priorities and to identify the levels of physiological needs, safety, love and belonging, self-esteem, and self-actualization (basic needs are met before moving to other needs in the hierarchy).
- The nurse can use the steps of the nursing process as a guide to determine priorities, remembering that assessment is the first step of the nursing process.

C. Setting priorities for client teaching

1. Determine the client's immediate learning needs.
2. Review the learning objectives established for the client.
3. Determine what the client perceives as important.
4. Assess the client's anxiety level and the time available to teach.

D. Prioritizing when caring for a group of clients

1. Identify the problems of each client.
2. Review the problems and any nursing diagnoses.
3. Determine which client problems are most urgent based on basic needs, the client's changing or unstable status, and complexity of the client's problems.

4. Anticipate the time that it may take to care for the priority needs of the clients.
5. Combine activities, if possible, to resolve more than 1 problem at a time.
6. Involve the client in his or her care as much as possible (see [Priority Nursing Actions](#)).

⚡ PRIORITY NURSING ACTIONS

Assessing a Group of Clients in Order of Priority

The nurse is assigned to the following clients. The order of priority in assessing the clients is as follows:

1. A client with heart failure who has a 4-lb weight gain since yesterday and is experiencing shortness of breath
2. A 24-hour postoperative client who had a wedge resection of the lung and has a closed chest tube drainage system
3. A client admitted to the hospital for observation who has absent bowel sounds
4. A client who is undergoing surgery for a hysterectomy on the following day

The nurse determines the order of priority by considering the needs of the client. The nurse also uses guidelines for prioritizing, such as the ABCs—airway—breathing—circulation—Maslow’s Hierarchy of Needs theory, and the steps of the nursing process. Clients 1 and 2 have conditions that relate to the cardiac system or respiratory system. These clients are the high priorities. Client 1 is the first priority because this client is experiencing shortness of breath (life-threatening). There is no indication that client 2 is experiencing any difficulty. Because client 4 is scheduled for surgery on the following day, this client would be the last priority (low priority), and the nurse would assess this client and prepare this client for surgery after other clients are assessed. Because absent bowel sounds could be an indication of a bowel obstruction (intermediate priority), client 3 would be the nurse’s third priority.

References

Potter et al. (2013), pp. 237–238; Zerwekh, Zerwekh Garneau (2015), pp. 35–36.

 Use the ABCs (airway–breathing–circulation), Maslow’s Hierarchy of Needs theory, and the steps of the nursing process (assessment is first) to prioritize. Also consider the acuity level of clients when applying these guidelines. If cardiopulmonary resuscitation (CPR) needs to be initiated, use CAB (compressions–airway–breathing) as the priority guideline.

XVIII. Disasters and Emergency Response Planning

A. Description

1. A disaster is any human-made or natural event that causes destruction and devastation that cannot be alleviated without assistance ([Box 7-11](#)).
2. Internal disasters are disasters that occur within a health care agency (e.g., health care agency fire, structural collapse, radiation spill), whereas

BOX 7-11 Types of Disasters

Human-Made Disasters

Dam failures resulting in flooding
 Hazardous substance accidents such as pollution, chemical spills, or toxic gas leaks
 Accidents involving release of radioactive material
 Resource shortages such as food, water, and electricity
 Structural collapse, fire, or explosions
 Terrorist attacks such as bombing, riots, and bioterrorism
 Mass transportation accidents

Natural Disasters

Avalanches
 Blizzards
 Communicable disease epidemics
 Cyclones
 Droughts
 Earthquakes
 Floods
 Forest fires
 Hailstorms
 Hurricanes
 Landslides
 Mudslides
 Tidal waves
 Tornadoes
 Volcanic eruptions

external disasters are disasters that occur outside the health care agency (e.g., mass transit accident that could send hundreds of victims to emergency departments).

3. A **multi-casualty** event involves a limited number of victims or casualties and can be managed by a hospital with available resources; a **mass casualty event** involves a number of casualties that exceeds the resource capabilities of the hospital, and is also known as a disaster.
 4. An emergency response plan is a formal plan of action for coordinating the response of the health care agency staff in the event of a disaster in the health care agency or surrounding community.
- B. American Red Cross (ARC)
1. The ARC has been given authority by the federal government to provide disaster relief.
 2. All ARC disaster relief assistance is free, and local offices are located across the United States.
 3. The ARC participates with the government in developing and testing community disaster plans.
 4. The ARC identifies and trains personnel for emergency response.
 5. The ARC works with businesses and labor organizations to identify resources and individuals for disaster work.
 6. The ARC educates the public about ways to prepare for a disaster.

7. The ARC operates shelters, provides assistance to meet immediate emergency needs, and provides disaster health services, including crisis counseling.
 8. The ARC handles inquiries from family members.
 9. The ARC coordinates relief activities with other agencies.
 10. Nurses are involved directly with the ARC and assume functions such as managers, supervisors, and educators of first aid; they also participate in emergency response plans and disaster relief programs and provide services, such as blood collection drives and immunization programs.
- C. HAZMAT (Hazardous Materials) Team
1. HAZMAT teams are typically composed of emergency department health care providers and nursing staff because they will be the first individuals to encounter the potential exposure.
 2. Members of HAZMAT teams have been educated on how to recognize patterns of illness that may be indicative of nuclear, biological, and chemical exposure; protocols for pharmacological treatment of infectious disease agents; availability of decontamination facilities and personal protective gear; safety measures; and the methods of responding to an exposure.
- D. Phases of disaster **management**
1. The Federal Emergency Management Agency (FEMA) identifies 4 disaster management phases: mitigation, preparedness, response, and recovery.
 2. Mitigation encompasses the following:
 - a. Actions or measures that can prevent the occurrence of a disaster or reduce the damaging effects of a disaster
 - b. Determination of the community hazards and community risks (actual and potential threats) before a disaster occurs
 - c. Awareness of available community resources and community health personnel to facilitate mobilization of activities and minimize chaos and confusion if a disaster occurs
 - d. Determination of the resources available for care to infants, older adults, disabled individuals, and individuals with chronic health problems
 3. Preparedness encompasses the following:
 - a. Plans for rescue, evacuation, and caring for disaster victims
 - b. Plans for training disaster personnel and gathering resources, equipment, and other materials needed for dealing with the disaster
 - c. Identification of specific responsibilities for various emergency response personnel
 - d. Establishment of a community emergency response plan and an effective public communication system
 4. Response encompasses the following:
 - a. Putting disaster planning services into action and the actions taken to save lives and prevent further damage
 - b. Primary concerns include safety, physical health, and mental health of victims and members of the disaster response team
 5. Recovery encompasses the following:
 - a. Actions taken to return to a normal situation after the disaster
 - b. Preventing debilitating effects and restoring personal, economic, and environmental health and stability to the community
- E. Levels of disaster
1. FEMA identifies 3 levels of disaster with FEMA response (**Box 7-12**).
 2. When a federal emergency has been declared, the federal response plan may take effect and activate emergency support functions.
 3. The emergency support functions of the ARC include performing emergency first aid, sheltering, feeding, providing a disaster welfare information system, and coordinating bulk distribution of emergency relief supplies.
 4. Disaster medical assistant teams (teams of specially trained personnel) can be activated and sent to a disaster site to provide triage and medical care to victims until they can be evacuated to a hospital.

BOX 7-12 Federal Emergency Management Agency (FEMA) Levels of Disaster

Level I Disaster

Massive disaster that involves significant damage and results in a presidential disaster declaration, with major federal involvement and full engagement of federal, regional, and national resources

Level II Disaster

Moderate disaster that is likely to result in a presidential declaration of an emergency, with moderate federal assistance

Level III Disaster

Minor disaster that involves a minimal level of damage, but could result in a presidential declaration of an emergency

F. Nurse's role in disaster planning

1. Personal and professional preparedness
 - a. Make personal and family preparations (Box 7-13).
 - b. Be aware of the disaster plan at the place of employment and in the community.
 - c. Maintain certification in disaster training and in CPR.
 - d. Participate in mock disaster drills, including a bomb threat drill.
 - e. Prepare professional emergency response items, such as a copy of nursing license, personal health care equipment such as a stethoscope, cash, warm clothing, record-keeping materials, and other nursing care supplies.

BOX 7-13 Emergency Plans and Supplies

Plan a meeting place for family members.

Identify where to go if an evacuation is necessary.

Determine when and how to turn off water, gas, and electricity at main switches.

Locate the safe spots in the home for each type of disaster.

Replace stored water supply every 3 months and stored food supply every 6 months.

Include the following supplies:

- Backpack, clean clothing, sturdy footwear
- Pocket-knife or multi-tool
- A 3-day supply of water (1 gallon per person per day)
- A 3-day supply of nonperishable food
- Blankets/sleeping bags/pillows
- First-aid kit with over-the-counter medications and vitamins
- Adequate supply of prescription medication
- Battery-operated radio
- Flashlight and batteries
- Credit card, cash, or traveler's checks
- Personal ID card, list of emergency contacts, allergies, medical information, list of credit card numbers and bank accounts (all sealed in water-tight package)
- Extra set of car keys and a full tank of gas in the car
- Sanitation supplies for washing, toileting, and disposing of trash; hand sanitizer
- Extra pair of eyeglasses/sunglasses
- Special items for infants, older adults, or disabled individuals
- Items needed for a pet such as food, water, and leash
- Paper, pens, pencils, maps
- Cell phone
- Work gloves
- Rain gear
- Roll of duct tape and plastic sheeting
- Radio and extra batteries
- Toiletries (basic daily needs, sunscreen, insect repellent, toilet paper)
- Plastic garbage bags and resealable bags
- Household bleach for disinfection
- Whistle
- Matches in a waterproof container

From Ignatavicius D, Workman M: Medical surgical nursing: patient-centered collaborative care, ed 7, Philadelphia, 2013, Saunders.

2. Disaster response

- a. In the health care agency setting, if a disaster occurs, the agency disaster preparedness plan (emergency response plan) is activated immediately, and the nurse responds by following the directions identified in the plan.
- b. In the community setting, if the nurse is the first responder to a disaster, the nurse cares for the victims by attending to the victims with life-threatening problems first; when rescue workers arrive at the scene, immediate plans for triage should begin.

 In the event of a disaster, activate the emergency response plan immediately.

G. Triage

1. In a disaster or war, triage consists of a brief assessment of victims that allows the nurse to classify victims according to the severity of the injury, urgency of treatment, and place for treatment (see [Priority Nursing Actions](#)).

⚡ PRIORITY NURSING ACTIONS**Triage Victims at the Site of an Accident**

The nurse is the first responder at the scene of a school bus accident. The nurse triages the victims from highest to lowest priority as follows:

1. Confused child with bright red blood pulsating from a leg wound
2. Child with a closed head wound and multiple compound fractures of the arms and legs
3. Child with a simple fracture of the arm complaining of arm pain
4. Sobbing child with several minor lacerations on the face, arms, and legs

Triage systems identify which victims are the priority and should be treated first. Rankings are based on immediacy of needs, including victims with immediate threat to life requiring immediate treatment (emergent), victims whose injuries are not life-threatening provided that they are treated within 30 minutes to 2 hours (urgent), and victims with sustained local injuries who do not have immediate complications and can wait at least 2 hours for medical treatment (nonurgent). Victim 1 has a wound that is pulsating bright red blood; this indicates arterial puncture. The child is also confused, which indicates the presence of hypoxia and shock (emergent). Victim 2 has sustained multiple traumas, so this victim is also classified as emergent and would require immediate treatment; however, victim 1 is the higher priority because of the arterial puncture. Victim 3 has sustained injuries that are not life-threatening provided that the injuries can be treated in 30 minutes to 2 hours (urgent). Victim 4 has sustained minor injuries that can wait at least 2 hours for treatment (nonurgent).

Reference

Perry, Potter, Ostendorf (2014), pp. 327–328.

2. In an emergency department, triage consists of a brief assessment of clients that allows the nurse to classify clients according to their need for care and establish priorities of care; the type of illness or injury, the severity of the problem, and the resources available govern the process.

H. Emergency department triage system

1. A commonly used rating system in an emergency department is a 3-tier system that uses the categories of emergent, urgent, and nonurgent; these categories may be identified by color coding or numbers (Box 7-14).
2. The nurse needs to be familiar with the triage system of the health care agency.
3. When caring for a client who has died, the nurse needs to recognize the importance of family and cultural and religious rituals and provide support to loved ones.
4. Organ donation procedures of the health care agency need to be addressed if appropriate.

 **Think survivability.** If you are the first responder to a scene of a disaster, such as a train crash, a priority victim is one whose life can be saved.

BOX 7-14 Emergency Department Triage

Emergent (Red): Priority 1 (Highest)

This classification is assigned to clients who have life-threatening injuries and need immediate attention and continuous evaluation, but have a high probability for survival when stabilized.

Such clients include trauma victims, clients with chest pain, clients with severe respiratory distress or cardiac arrest, clients with limb amputation, clients with acute neurological deficits, and clients who have sustained chemical splashes to the eyes.

Urgent (Yellow): Priority 2

This classification is assigned to clients who require treatment and whose injuries have complications that are not life-threatening, provided that they are treated within 30 minutes to 2 hours; these clients require continuous evaluation every 30 to 60 minutes thereafter.

Such clients include clients with an open fracture with a distal pulse and large wounds.

Nonurgent (Green): Priority 3

This classification is assigned to clients with local injuries who do not have immediate complications and who can wait at least 2 hours for medical treatment; these clients require evaluation every 1 to 2 hours thereafter. Such clients include clients with conditions such as a closed fracture, minor lacerations, sprains, strains, or contusions.

Note: Some triage systems include tagging a client “Black” if the victim is dead or who soon will be deceased because of severe injuries; these are victims that would not benefit from any care because of the severity of injuries.

I. Client assessment in the emergency department

1. Primary assessment

- a. The purpose of primary assessment is to identify any client problem that poses an immediate or potential threat to life.
- b. The nurse gathers information primarily through objective data and, on finding any abnormalities, immediately initiates interventions.
- c. The nurse uses the ABCs—airway—breathing—circulation—as a guide in assessing a client’s needs and assesses a client who has sustained a traumatic injury for signs of a head injury or cervical spine injury. If CPR needs to be initiated, use CAB (compressions—airway—breathing) as the priority guideline.

2. Secondary assessment

- a. The nurse performs secondary assessment after the primary assessment and after treatment for any primary problems identified.
- b. Secondary assessment identifies any other life-threatening problems that a client might be experiencing.
- c. The nurse obtains subjective and objective data, including a history, general overview, vital sign measurements, neurological assessment, pain assessment, and complete or focused physical assessment.

CRITICAL THINKING What Should You Do?

Answer: Quality improvement, also known as performance improvement, focuses on processes or systems that significantly contribute to client safety and effective client care outcomes; criteria are used to monitor outcomes of care and to determine the need for change to improve the quality of care. If the nurse notes a particular problem, such as an increase in the number of intravenous (IV) site infections, the nurse should collect data about the problem. This should include information such as the primary and secondary diagnoses of the clients developing the infection, the type of IV catheters being used, the site of the catheter, IV site dressings being used, frequency of assessment and methods of care to the IV site, and length of time that the IV catheter was inserted. Once these data are collected and analyzed, the nurse should examine evidence-based practice protocols to identify the best practices for care to IV sites to prevent infection. These practices can then be implemented and followed by evaluation of results based on the evidence-based practice protocols used.

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 511, 514.

PRACTICE QUESTIONS

26. The nurse is assigned to care for four clients. In planning client rounds, which client should the nurse assess first?
1. A postoperative client preparing for discharge with a new medication
 2. A client requiring daily dressing changes of a recent surgical incision
 3. A client scheduled for a chest x-ray after insertion of a nasogastric tube
 4. A client with asthma who requested a breathing treatment during the previous shift
27. The nurse employed in an emergency department is assigned to triage clients coming to the emergency department for treatment on the evening shift. The nurse should assign priority to which client?
1. A client complaining of muscle aches, a headache, and history of seizures
 2. A client who twisted her ankle when rollerblading and is requesting medication for pain
 3. A client with a minor laceration on the index finger sustained while cutting an eggplant
 4. A client with chest pain who states that he just ate pizza that was made with a very spicy sauce
28. A nursing graduate is attending an agency orientation regarding the nursing model of practice implemented in the health care facility. The nurse is told that the nursing model is a team nursing approach. The nurse determines that which scenario is characteristic of the team-based model of nursing practice?
1. Each staff member is assigned a specific task for a group of clients.
 2. A staff member is assigned to determine the client's needs at home and begin discharge planning.
 3. A single registered nurse (RN) is responsible for providing care to a group of 6 clients with the aid of an unlicensed assistive personnel (UAP).
 4. An RN leads 2 licensed practical nurses (LPNs) and 3 UAPs in providing care to a group of 12 clients.
29. The nurse has received the assignment for the day shift. After making initial rounds and checking all of the assigned clients, which client should the nurse plan to care for first?
1. A client who is ambulatory demonstrating steady gait
 2. A postoperative client who has just received an opioid pain medication
 3. A client scheduled for physical therapy for the first crutch-walking session
 4. A client with a white blood cell count of $14,000 \text{ mm}^3$ ($14 \times 10^9/\text{L}$) and a temperature of $38.4 \text{ }^\circ\text{C}$
30. The nurse is giving a bed bath to an assigned client when an unlicensed assistive personnel (UAP) enters the client's room and tells the nurse that another assigned client is in pain and needs pain medication. Which is the most appropriate nursing action?
1. Finish the bed bath and then administer the pain medication to the other client.
 2. Ask the UAP to find out when the last pain medication was given to the client.
 3. Ask the UAP to tell the client in pain that medication will be administered as soon as the bed bath is complete.
 4. Cover the client, raise the side rails, tell the client that you will return shortly, and administer the pain medication to the other client.
31. The nurse manager has implemented a change in the method of the nursing delivery system from functional to team nursing. An unlicensed assistive personnel (UAP) is resistant to the change and is not taking an active part in facilitating the process of change. Which is the best approach in dealing with the UAP?
1. Ignore the resistance.
 2. Exert coercion on the UAP.
 3. Provide a positive reward system for the UAP.
 4. Confront the UAP to encourage verbalization of feelings regarding the change.
32. The registered nurse is planning the client assignments for the day. Which is the most appropriate assignment for an unlicensed assistive personnel (UAP)?
1. A client requiring a colostomy irrigation
 2. A client receiving continuous tube feedings
 3. A client who requires urine specimen collections
 4. A client with difficulty swallowing food and fluids
- ❖ 33. The nurse manager is discussing the facility protocol in the event of a tornado with the staff. Which instructions should the nurse manager include in the discussion? Select all that apply.
- 1. Open doors to client rooms.
 - 2. Move beds away from windows.
 - 3. Close window shades and curtains.
 - 4. Place blankets over clients who are confined to bed.
 - 5. Relocate ambulatory clients from the hallways back into their rooms.
34. The nurse employed in a long-term care facility is planning assignments for the clients on a nursing unit. The nurse needs to assign four clients and has a licensed practical (vocational) nurse and 3 unlicensed assistive personnel (UAPs) on a nursing

team. Which client would the nurse most appropriately assign to the licensed practical (vocational) nurse?

1. A client who requires a bed bath
2. An older client requiring frequent ambulation
3. A client who requires hourly vital sign measurements
4. A client requiring abdominal wound irrigations and dressing changes every 3 hours

❖ 35. The charge nurse is planning the assignment for the day. Which factors should the nurse remain mindful of when planning the assignment? Select all that apply.

- 1. The acuity level of the clients
- 2. Specific requests from the staff
- 3. The clustering of the rooms on the unit
- 4. The number of anticipated client discharges
- 5. Client needs and workers' needs and abilities

ANSWERS

26. 4

Rationale: Airway is always the highest priority, and the nurse would attend to the client with asthma who requested a breathing treatment during the previous shift. This could indicate that the client was experiencing difficulty breathing. The clients described in options 1, 2, and 3 have needs that would be identified as intermediate priorities.

Test-Taking Strategy: Note the **strategic word**, first. Use the **ABCs—airway, breathing, and circulation**—to answer the question. Remember that airway is always the highest priority. This will direct you to the correct option.

Review: **Prioritizing guidelines**

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Leadership/Management—Prioritizing

Priority Concepts: Care Coordination; Clinical Judgment

References: Jarvis (2016), pp. 4–5; Potter et al. (2013), pp. 838–840.

27. 4

Rationale: In an emergency department, triage involves brief client assessment to classify clients according to their need for care and includes establishing priorities of care. The type of illness or injury, the severity of the problem, and the resources available govern the process. Clients with trauma, chest pain, severe respiratory distress or cardiac arrest, limb amputation, and acute neurological deficits, or who have sustained chemical splashes to the eyes, are classified as emergent and are the number-1 priority. Clients with conditions such as a simple fracture, asthma without respiratory distress, fever, hypertension, abdominal pain, or a renal stone have urgent needs and are classified as a number-2 priority. Clients with conditions such as a minor laceration, sprain, or cold symptoms are classified as non-urgent and are a number-3 priority.

Test-Taking Strategy: Note the **strategic word**, priority. Use the **ABCs—airway, breathing, and circulation**—to direct you to the correct option. A client experiencing chest pain is always classified as Priority 1 until a myocardial infarction has been ruled out.

Review: The **triage** classification system

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Assessment

Content Area: Leadership/Management—Triage

Priority Concepts: Care Coordination; Clinical Judgment

Reference: Jarvis (2016), pp. 4–5.

28. 4

Rationale: In team nursing, nursing personnel are led by a registered nurse leader in providing care to a group of clients. Option 1 identifies functional nursing. Option 2 identifies a component of case management. Option 3 identifies primary nursing (relationship-based practice).

Test-Taking Strategy: Focus on the **subject**, team nursing. Keep this **subject** in mind and select the option that best describes a team approach. The correct option is the only one that identifies the concept of a team approach.

Review: The various types of **nursing delivery systems**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Leadership/Management—Delegating

Priority Concepts: Care Coordination; Collaboration

Reference: Huber (2014), pp. 263, 265–266.

29. 4

Rationale: The nurse should plan to care for the client who has an elevated white blood cell count and a fever first because this client's needs are the priority. The client who is ambulatory with steady gait and the client scheduled for physical therapy for a crutch-walking session do not have priority needs. Waiting for pain medication to take effect before providing care to the post-operative client is best.

Test-Taking Strategy: Note the **strategic word**, first, and use principles related to prioritizing. Recalling the normal white blood cell count is 5000–10,000 mm³ (5–10 × 10⁹/L) and the normal temperature range 97.5 °F to 99.5 °F (36.4 °C to 37.5 °C) will direct you to the correct option.

Review: The principles related to **prioritizing guidelines**

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Leadership/Management—Prioritizing

Priority Concepts: Care Coordination; Clinical Judgment

References: Potter et al. (2013), pp. 838–840; Zerwekh, Zerwekh Garneau (2015), pp. 35–36.

30. 4

Rationale: The nurse is responsible for the care provided to assigned clients. The appropriate action in this situation is to provide safety to the client who is receiving the bed bath and prepare to administer the pain medication. Options 1 and 3 delay the administration of medication to the client in pain. Option 2 is not a responsibility of the UAP.

Test-Taking Strategy: Note the **strategic words**, most appropriate, and use principles related to priorities of care. Options 1

and 3 are **comparable or alike** and delay the administration of pain medication, and option 2 is not a responsibility of the UAP. The most appropriate action is to plan to administer the medication.

Review: Principles related to **prioritizing care**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Prioritizing

Priority Concepts: Care Coordination; Clinical Judgment

Reference: Potter et al. (2013), p. 784.

31. 4

Rationale: Confrontation is an important strategy to meet resistance head-on. Face-to-face meetings to confront the issue at hand will allow verbalization of feelings, identification of problems and issues, and development of strategies to solve the problem. Option 1 will not address the problem. Option 2 may produce additional resistance. Option 3 may provide a temporary solution to the resistance, but will not address the concern specifically.

Test-Taking Strategy: Note the **strategic word**, best. Options 1 and 2 can be eliminated first because of the words ignore in option 1 and coercion in option 2. From the remaining options, select the correct option over option 3 because the correct option specifically addresses problem-solving measures.

Review: **Resistance to change**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Ethical/Legal

Priority Concepts: Leadership; Professionalism

Reference: Huber (2014), pp. 38, 46–47.

32. 3

Rationale: The nurse must determine the most appropriate assignment based on the skills of the staff member and the needs of the client. In this case, the most appropriate assignment for the UAP would be to care for the client who requires urine specimen collections. The UAP is skilled in this procedure. Colostomy irrigations and tube feedings are not performed by UAPs because these are invasive procedures. The client with difficulty swallowing food and fluids is at risk for aspiration.

Test-Taking Strategy: Note the **strategic words**, most appropriate, and note the **subject**, an assignment to the UAP. Eliminate option 4 first because of the words difficulty swallowing. Next, eliminate options 1 and 2 because they are **comparable or alike** and are both invasive procedures and as such a UAP cannot perform these procedures.

Review: **Delegation guidelines**

Level of Cognitive Ability: Creating

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Leadership/Management—Delegating

Priority Concepts: Care Coordination; Clinical Judgment

References: Huber (2014), pp. 147–148; Zerwekh, Zerwekh Garneau (2015), p. 305.

❖ 33. 2, 3, 4

Rationale: In this weather event, the appropriate nursing actions focus on protecting clients from flying debris or glass. The nurse should close doors to each client's room and move beds away from windows, and close window shades and curtains to protect clients, visitors, and staff from shattering glass and flying debris. Blankets should be placed over clients confined to bed. Ambulatory clients should be moved into the hallways from their rooms, away from windows.

Test-Taking Strategy: Focus on the **subject**, protecting the client in the event of a tornado. Visualize each of the actions in the options to determine if these actions would assist in protecting the client and preventing an accident or injury.

Review: The various types of safety measures in the event of a **disaster**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Leadership/Management—Prioritizing

Priority Concepts: Leadership; Professionalism

Reference: Potter et al. (2013), pp. 366–367, 387.

34. 4

Rationale: When delegating nursing assignments, the nurse needs to consider the skills and educational level of the nursing staff. Giving a bed bath, assisting with frequent ambulation, and taking vital signs can be provided most appropriately by UAP. The licensed practical (vocational) nurse is skilled in wound irrigations and dressing changes and most appropriately would be assigned to the client who needs this care.

Test-Taking Strategy: Focus on the **subject**, assignment to a licensed practical (vocational) nurse, and note the **strategic words**, most appropriately. Recall that education and job position as described by the nurse practice act and employee guidelines need to be considered when delegating activities and making assignments. Options 1, 2, and 3 can be eliminated because they are noninvasive tasks that the UAP can perform.

Review: The principles and guidelines of **delegation and assignments**

Level of Cognitive Ability: Creating

Integrated Process: Nursing Process—Planning

Content Area: Leadership/Management—Delegating

Priority Concepts: Care Coordination; Clinical Judgment

Reference: Zerwekh, Zerwekh Garneau (2015), pp. 305, 308.

❖ 35. 1, 5

Rationale: There are guidelines that the nurse should use when delegating and planning assignments. These include the following: ensure client safety; be aware of individual variations in work abilities; determine which tasks can be delegated and to whom; match the task to the delegatee on the basis of the nurse practice act and appropriate position descriptions; provide directions that are clear, concise, accurate, and complete; validate the delegatee's understanding of the directions; communicate a feeling of confidence to the delegatee and provide feedback promptly after the task is performed; and maintain

continuity of care as much as possible when assigning client care. Staff requests, convenience as in clustering client rooms, and anticipated changes in unit census are not specific guidelines to use when delegating and planning assignments.

Test-Taking Strategy: Focus on the **subject**, guidelines to use when delegating and planning assignments. Read each option carefully and use **Maslow's Hierarchy of Needs theory**. Note that the correct options directly relate to the client's needs and client safety.

Review: The principles and guidelines of **delegation and assignments**.

UNIT III

Nursing Sciences

Pyramid to Success

Pyramid Points focus on fluids and electrolytes, acid-base balance, laboratory reference intervals, nutrition, intravenous (IV) therapy, and blood administration. Fluids and electrolytes and acid-base balance constitute a content area that is sometimes complex and difficult to understand. For a client who is experiencing these imbalances, it is important to remember that maintenance of a patent airway is a priority and the nurse needs to monitor vital signs, physiological status, intake and output, laboratory reference intervals, and arterial blood gas values. It is also important to remember that normal laboratory reference levels may vary slightly, depending on the laboratory setting and equipment used in testing. If you are familiar with the normal reference intervals, you will be able to determine whether an abnormality exists when a laboratory value is presented in a question. The specific laboratory reference levels identified in the NCLEX[®] test plan that you need to know include arterial blood gases known as ABGs (pH, PO₂, PCO₂, SaO₂, HCO₃), blood urea nitrogen (BUN), cholesterol (total), glucose, hematocrit, hemoglobin, glycosylated hemoglobin (HgbA1C), platelets, potassium, sodium, white blood cell (WBC) count, creatinine, prothrombin time (PT), activated partial thromboplastin time (aPTT), and international normalized ratio (INR). The questions on the NCLEX-RN examination related to laboratory reference intervals will require you to identify whether the laboratory value is normal or abnormal, and then you will be required to think critically about the effects of the laboratory value in terms of the client. Note the disorder presented in the question and the associated body organ affected as a result of the disorder. This process will assist you in determining the correct answer.

Nutrition is a basic need that must be met for all clients. The NCLEX-RN examination addresses the dietary measures required for basic needs and for particular body system alterations and addresses parenteral nutrition (PN), both partial parenteral nutrition (PPN) and total parenteral nutrition (TPN). When presented with

a question related to nutrition, consider the client's diagnosis and the particular requirement or restriction necessary for treatment of the disorder. With regard to IV therapy, assessment of the client for allergies, including latex sensitivity, before initiation of an IV line and monitoring for complications are critical nursing responsibilities. Likewise, the procedure for administering blood components, the signs and symptoms of transfusion reaction, and the immediate interventions if a transfusion reaction occurs are a focus.

Client Needs: Learning Objectives

Safe and Effective Care Environment

- Applying principles of infection control
- Collaborating with interprofessional teams
- Ensuring that informed consent has been obtained for invasive procedures and for the administration of blood products
- Establishing priorities for care
- Handling hazardous and infectious materials to prevent injury to health care personnel and others
- Identifying the client with at least 2 forms of identifiers (e.g., name and identification number) prior to the administration of a blood product
- Initiating home health care referrals
- Maintaining continuity of care and providing close supervision during a blood transfusion
- Maintaining asepsis and preventing infection in the client when samples for laboratory studies are obtained or when IV solutions are administered
- Maintaining standard, transmission-based, and other precautions to prevent transmission of infection to self and others
- Preventing accidents and ensuring safety of the client when a fluid or electrolyte imbalance exists, particularly when changes in cardiovascular, respiratory, gastrointestinal, neuromuscular, renal, or central nervous systems occur, or when the client is at risk for complications such as seizures, respiratory depression, or dysrhythmias

- Providing information to the client about community classes for nutrition education
- Providing safety for the client during implementation of treatments
- Using equipment such as electronic IV infusion devices safely
- Upholding client rights

Health Promotion and Maintenance

- Assessing the client's ability to perform self-care
- Considering lifestyle choices related to home care of the IV line
- Evaluating the client's home environment for self-care modifications
- Identifying clients at risk for an acid-base imbalance
- Identifying community resources available for follow-up
- Identifying lifestyle choices related to receiving a blood transfusion
- Implementing health screening and monitoring for the potential risk for a fluid and electrolyte imbalance
- Performing physical assessment techniques
- Providing client and family education regarding the administration of PN at home
- Providing education related to medication and diet management
- Providing education related to the potential risk for a fluid and electrolyte imbalance, measures to prevent an imbalance, signs and symptoms of an imbalance, and actions to take if signs and symptoms develop
- Teaching the client and family about prevention, early detection, and treatment measures for health disorders
- Teaching the client to monitor for signs and symptoms that indicate the need to notify the health care provider
- Teaching the client and family about care of the IV line

Psychosocial Integrity

- Assessing the client's emotional response to treatment
- Considering cultural and spiritual preferences related to nutritional patterns and lifestyle choices
- Discussing role changes and alterations in lifestyle related to the client's need to receive PN
- Ensuring therapeutic interactions with the client regarding the procedure for blood administration
- Identifying coping mechanisms

- Identifying religious, spiritual, and cultural considerations related to blood administration
- Identifying support systems in the home to assist with caring for an IV and the administration of PN
- Providing emotional support to the client during testing
- Providing reassurance to the client who is experiencing a fluid or electrolyte imbalance
- Providing support and continuously informing the client of the purposes for prescribed interventions

Physiological Integrity

- Administering and monitoring medications, IV fluids, and other therapeutic interventions
- Administering blood products safely
- Assessing and caring for central venous access devices
- Assessing for expected and unexpected responses to therapeutic interventions and documenting findings
- Assessing venous access devices for blood administration
- Assisting with obtaining an ABG specimen and analyzing the results
- Identifying clients who are at risk for a fluid or electrolyte imbalance
- Maintaining IV therapy
- Managing medical emergencies if a transfusion reaction or other complication occurs
- Monitoring for complications related to blood administration
- Monitoring for complications related to a body system alteration
- Monitoring for changes in status and for complications; taking actions if a complication arises
- Monitoring for clinical manifestations associated with an abnormal laboratory value
- Monitoring of enteral feedings and the client's ability to tolerate feedings
- Monitoring for expected effects of pharmacological and parenteral therapies
- Monitoring laboratory reference intervals; determining the significance of an abnormal laboratory value and the need to implement specific actions based on the laboratory results
- Monitoring of nutritional intake and oral hydration
- Providing wound care when blood is obtained for an ABG study
- Reducing the likelihood that an acid-base imbalance will occur

Fluids and Electrolytes

PRIORITY CONCEPTS Cellular Regulation; Fluid and Electrolytes

CRITICAL THINKING What Should You Do?

The nurse notes the presence of U waves on a client's cardiac monitor screen. What actions should the nurse take?
Answer located on p. 91.

I. Concepts of Fluid and Electrolyte Balance

A. Electrolytes

1. Description: An electrolyte is a substance that, on dissolving in solution, ionizes; that is, some of its molecules split or dissociate into electrically charged atoms or ions (**Box 8-1**).
2. Measurement
 - a. The metric system is used to measure volumes of fluids—liters (L) or milliliters (mL).
 - b. The unit of measure that expresses the combining activity of an electrolyte is the milliequivalent (mEq).
 - c. One milliequivalent (1 mEq) of any cation always reacts chemically with 1 mEq of an anion.
 - d. Milliequivalents provide information about the number of anions or cations available to combine with other anions or cations.

B. Body fluid compartments (**Fig. 8-1**)

1. Description
 - a. Fluid in each of the body compartments contains electrolytes.
 - b. Each compartment has a particular composition of electrolytes, which differs from that of other compartments.
 - c. To function normally, body cells must have fluids and electrolytes in the right compartments and in the right amounts.
 - d. Whenever an electrolyte moves out of a cell, another electrolyte moves in to take its place.
 - e. The numbers of cations and anions must be the same for **homeostasis** to exist.

- f. Compartments are separated by semipermeable membranes.

2. Intravascular compartment: Refers to fluid inside a **blood** vessel
3. Intracellular compartment
 - a. The intracellular compartment refers to all fluid inside the cells.
 - b. Most bodily fluids are inside the cells.
4. Extracellular compartment
 - a. Refers to fluid outside the cells.
 - b. The extracellular compartment includes the interstitial fluid, which is fluid between cells (sometimes called the third space), blood, lymph, bone, connective tissue, water, and transcellular fluid.

C. Third-spacing

1. Third-spacing is the accumulation and sequestration of trapped extracellular fluid in an actual or potential body space as a result of disease or injury.
2. The trapped fluid represents a volume loss and is unavailable for normal physiological processes.
3. Fluid may be trapped in body spaces such as the pericardial, pleural, peritoneal, or joint cavities; the bowel; or the abdomen, or within soft tissues after trauma or burns.
4. Assessing the intravascular fluid loss caused by third-spacing is difficult. The loss may not be reflected in weight changes or intake and output records, and may not become apparent until after organ malfunction occurs.

D. Edema

1. Edema is an excess accumulation of fluid in the interstitial space; it occurs as a result of alterations in oncotic pressure, hydrostatic pressure, capillary permeability, and lymphatic obstruction.
2. Localized edema occurs as a result of traumatic injury from accidents or surgery, local inflammatory processes, or burns.
3. Generalized edema, also called anasarca, is an excessive accumulation of fluid in the interstitial

BOX 8-1 Properties of Electrolytes and Their Components**Atom**

An atom is the smallest part of an element that still has the properties of the element.

The atom is composed of particles known as the proton (positive charge), neutron (neutral), and electron (negative charge).

Protons and neutrons are in the nucleus of the atom; therefore, the nucleus is positively charged.

Electrons carry a negative charge and revolve around the nucleus.

As long as the number of electrons is the same as the number of protons, the atom has no net charge; that is, it is neither positive nor negative.

Atoms that gain, lose, or share electrons are no longer neutral.

Molecule

A molecule is 2 or more atoms that combine to form a substance.

Ion

An ion is an atom that carries an electrical charge because it has gained or lost electrons.

Some ions carry a negative electrical charge and some carry a positive charge.

Cation

A cation is an ion that has given away or lost electrons and therefore carries a positive charge.

The result is fewer electrons than protons, and the result is a positive charge.

Anion

An anion is an ion that has gained electrons and therefore carries a negative charge.

When an ion has gained or taken on electrons, it assumes a negative charge and the result is a negatively charged ion.

FIGURE 8-1 Distribution of fluid by compartments in the average adult.

space throughout the body and occurs as a result of conditions such as cardiac, renal, or liver failure.

E. Body fluid**1. Description**

- Body fluids transport **nutrients** to the cells and carry waste products from the cells.
- Total body fluid (intracellular and extracellular) amounts to about 60% of body weight in the adult, 55% in the older adult, and 80% in the infant.
- Thus infants and older adults are at a higher risk for fluid-related problems than younger adults; children have a greater proportion of body water than adults and the older adult has the least proportion of body water.

2. Constituents of body fluids

- Body fluids consist of water and dissolved substances.
- The largest single fluid constituent of the body is water.
- Some substances, such as glucose, urea, and creatinine, do not dissociate in solution; that is, they do not separate from their complex forms into simpler substances when they are in solution.
- Other substances do dissociate; for example, when sodium chloride is in a solution, it dissociates, or separates, into 2 parts or elements.

! Infants and older adults need to be monitored closely for fluid imbalances.

F. Body fluid transport**1. Diffusion**

- Diffusion is the process whereby a solute (substance that is dissolved) may spread through a solution or solvent (solution in which the solute is dissolved).
- Diffusion of a solute spreads the molecules from an area of higher concentration to an area of lower concentration.
- A permeable membrane allows substances to pass through it without restriction.
- A selectively permeable membrane allows some solutes to pass through without restriction but prevents other solutes from passing freely.
- Diffusion occurs within fluid compartments and from one compartment to another if the barrier between the compartments is permeable to the diffusing substances.

2. Osmosis
 - a. Osmotic pressure is the force that draws the solvent from a less concentrated solute through a selectively permeable membrane into a more concentrated solute, thus tending to equalize the concentration of the solvent.
 - b. If a membrane is permeable to water but not to all solutes present, the membrane is a selective or semipermeable membrane.
 - c. Osmosis is the movement of solvent molecules across a membrane in response to a concentration gradient, usually from a solution of lower to one of higher solute concentration.
 - d. When a more concentrated solution is on one side of a selectively permeable membrane and a less concentrated solution is on the other side, a pull called osmotic pressure draws the water through the membrane to the more concentrated side, or the side with more solute.
 3. Filtration
 - a. Filtration is the movement of solutes and solvents by hydrostatic pressure.
 - b. The movement is from an area of higher pressure to an area of lower pressure.
 4. Hydrostatic pressure
 - a. Hydrostatic pressure is the force exerted by the weight of a solution.
 - b. When a difference exists in the hydrostatic pressure on two sides of a membrane, water and diffusible solutes move out of the solution that has the higher hydrostatic pressure by the process of filtration.
 - c. At the arterial end of the capillary, the hydrostatic pressure is higher than the osmotic pressure; therefore, fluids and diffusible solutes move out of the capillary.
 - d. At the venous end, the osmotic pressure, or pull, is higher than the hydrostatic pressure, and fluids and some solutes move into the capillary.
 - e. The excess fluid and solutes remaining in the interstitial spaces are returned to the intravascular compartment by the lymph channels.
 5. Osmolality
 - a. Osmolality refers to the number of osmotically active particles per kilogram of water; it is the concentration of a solution.
 - b. In the body, osmotic pressure is measured in milliosmoles (mOsm).
 - c. The normal osmolality of **plasma** is 275-295 mOsm/kg (275-295 mmol/kg).
- G. Movement of body fluid
1. Description
 - a. Cell membranes separate the interstitial fluid from the intravascular fluid.
 - b. Cell membranes are selectively permeable; that is, the cell membrane and the capillary wall allow water and some solutes free passage through them.
 - c. Several forces affect the movement of water and solutes through the walls of cells and capillaries; for example, the greater the number of particles within the cell, the more pressure exists to force the water through the cell membrane out of the cell.
 - d. If the body loses more electrolytes than fluids, as can happen in diarrhea, then the extracellular fluid contains fewer electrolytes or less solute than the intracellular fluid.
 - e. Fluids and electrolytes must be kept in balance for health; when they remain out of balance, death can occur.
2. Isotonic solutions
 - a. When the solutions on both sides of a selectively permeable membrane have established equilibrium or are equal in concentration, they are isotonic.
 - b. Isotonic solutions are isotonic to human cells, and thus very little osmosis occurs; isotonic solutions have the same osmolality as body fluids.
 - c. Refer to [Chapter 13, Table 13-1](#), for a list of isotonic solutions.
 3. Hypotonic solutions
 - a. When a solution contains a lower concentration of salt or solute than another, more concentrated solution, it is considered hypotonic.
 - b. A hypotonic solution has less salt or more water than an isotonic solution; these solutions have lower osmolality than body fluids.
 - c. Hypotonic solutions are hypotonic to the cells; therefore, osmosis would continue in an attempt to bring about balance or equality.
 - d. Refer to [Chapter 13, Table 13-1](#), for a list of hypotonic solutions.
 4. Hypertonic solutions
 - a. A solution that has a higher concentration of solutes than another, less concentrated solution is hypertonic; these solutions have a higher osmolality than body fluids.
 - b. Refer to [Chapter 13, Table 13-1](#), for a list of hypertonic solutions.
 5. Osmotic pressure
 - a. The amount of osmotic pressure is determined by the concentration of solutes in solution.
 - b. When the solutions on each side of a selectively permeable membrane are equal in concentration, they are isotonic.
 - c. A hypotonic solution has less solute than an isotonic solution, whereas a hypertonic solution contains more solute.
 - d. A solvent moves from the less concentrated solute side to the more concentrated solute side to equalize concentration.

6. Active transport
 - a. If an ion is to move through a membrane from an area of lower concentration to an area of higher concentration, an active transport system is necessary.
 - b. An active transport system moves molecules or ions against concentration and osmotic pressure.
 - c. Metabolic processes in the cell supply the energy for active transport.
 - d. Substances that are transported actively through the cell membrane include ions of **sodium, potassium, calcium**, iron, and hydrogen; some of the sugars; and the amino acids.

H. Body fluid intake and output (Fig. 8-2)

1. Body fluid intake
 - a. Water enters the body through 3 sources—orally ingested liquids, water in foods, and water formed by oxidation of foods.
 - b. About 10 mL of water is released by the **metabolism** of each 100 calories of fat, carbohydrates, or proteins.
2. Body fluid output
 - a. Water lost through the skin is called insensible loss (the individual is unaware of losing that water).
 - b. The amount of water lost by perspiration varies according to the temperature of the environment and of the body, but the average amount of loss by perspiration alone is 100 mL/day.
 - c. Water lost from the lungs is called insensible loss and is lost through expired air that is saturated with water vapor.
 - d. The amount of water lost from the lungs varies with the rate and the depth of respiration.
 - e. Large quantities of water are secreted into the gastrointestinal tract, but almost all of this fluid is reabsorbed.
 - f. A large volume of electrolyte-containing liquids moves into the gastrointestinal tract and then returns again to the extracellular fluid.

- g. Severe diarrhea results in the loss of large quantities of fluids and electrolytes.
- h. The kidneys play a major role in regulating fluid and electrolyte balance and excrete the largest quantity of fluid.
- i. Normal kidneys can adjust the amount of water and electrolytes leaving the body.
- j. The quantity of fluid excreted by the kidneys is determined by the amount of water ingested and the amount of waste and solutes excreted.
- k. As long as all organs are functioning normally, the body is able to maintain balance in its fluid content.

! The client with diarrhea is at high risk for a fluid and electrolyte imbalance.

I. Maintaining fluid and electrolyte balance

1. Description
 - a. **Homeostasis** is a term that indicates the relative stability of the internal environment.
 - b. Concentration and composition of body fluids must be nearly constant.
 - c. When one of the substances in a client is deficient—either fluids or electrolytes—the substance must be replaced normally by the intake of food and water or by therapy such as intravenous (IV) solutions and medications.
 - d. When the client has an excess of fluid or electrolytes, therapy is directed toward assisting the body to eliminate the excess.
2. The kidneys play a major role in controlling balance in fluid and electrolytes.
3. The adrenal glands, through the secretion of aldosterone, also aid in controlling extracellular fluid volume by regulating the amount of sodium reabsorbed by the kidneys.
4. Antidiuretic hormone from the pituitary gland regulates the osmotic pressure of extracellular fluid by regulating the amount of water reabsorbed by the kidneys.

II. Fluid Volume Deficit

A. Description

1. Dehydration occurs when the fluid intake of the body is not sufficient to meet the fluid needs of the body.
2. The goal of treatment is to restore fluid volume, replace electrolytes as needed, and eliminate the cause of the fluid volume deficit.

B. Types of fluid volume deficits

1. Isotonic dehydration
 - a. Water and dissolved electrolytes are lost in equal proportions.
 - b. Known as hypovolemia, isotonic dehydration is the most common type of dehydration.
 - c. Isotonic dehydration results in decreased circulating **blood** volume and inadequate tissue perfusion.

Fluid intake		Fluid output	
Ingested water	1200-1500 mL	Kidneys	1500 mL
Ingested food	800-1100 mL	Insensible loss through skin	600-800 mL
Metabolic oxidation	300 mL	Insensible loss through lungs	400-600 mL
		Gastrointestinal tract	100 mL
TOTAL	2300-2900 mL	TOTAL	2600-3000 mL

FIGURE 8-2 Sources of fluid intake and fluid output.

2. Hypertonic dehydration
 - a. Water loss exceeds electrolyte loss.
 - b. The clinical problems that occur result from alterations in the concentrations of specific plasma electrolytes.
 - c. Fluid moves from the intracellular compartment into the plasma and interstitial fluid spaces, causing cellular dehydration and shrinkage.
 3. Hypotonic dehydration
 - a. Electrolyte loss exceeds water loss.
 - b. The clinical problems that occur result from fluid shifts between compartments, causing a decrease in plasma volume.
 - c. Fluid moves from the plasma and interstitial fluid spaces into the cells, causing a plasma volume deficit and causing the cells to swell.
- C. Causes of fluid volume deficits
1. Isotonic dehydration
 - a. Inadequate intake of fluids and solutes
 - b. Fluid shifts between compartments
 - c. Excessive losses of isotonic body fluids
 2. Hypertonic dehydration—conditions that increase fluid loss, such as excessive perspiration, hyperventilation, ketoacidosis, prolonged fevers, diarrhea, early-stage kidney disease, and diabetes insipidus
 3. Hypotonic dehydration
 - a. Chronic illness
 - b. Excessive fluid replacement (hypotonic)
 - c. Kidney disease
 - d. Chronic malnutrition
- D. Assessment (Table 8-1)
- E. Interventions

TABLE 8-1 Assessment Findings: Fluid Volume Deficit and Fluid Volume Excess

Fluid Volume Deficit	Fluid Volume Excess
Cardiovascular	
<ul style="list-style-type: none"> ▪ Thready, increased pulse rate ▪ Decreased blood pressure and orthostatic (postural) hypotension ▪ Flat neck and hand veins in dependent positions ▪ Diminished peripheral pulses ▪ Decreased central venous pressure ▪ Dysrhythmias 	<ul style="list-style-type: none"> ▪ Bounding, increased pulse rate ▪ Elevated blood pressure ▪ Distended neck and hand veins ▪ Elevated central venous pressure ▪ Dysrhythmias
Respiratory	
<ul style="list-style-type: none"> ▪ Increased rate and depth of respirations ▪ Dyspnea 	<ul style="list-style-type: none"> ▪ Increased respiratory rate (shallow respirations) ▪ Dyspnea ▪ Moist crackles on auscultation
Neuromuscular	
<ul style="list-style-type: none"> ▪ Decreased central nervous system activity, from lethargy to coma ▪ Fever, depending on the amount of fluid loss ▪ Skeletal muscle weakness 	<ul style="list-style-type: none"> ▪ Altered level of consciousness ▪ Headache ▪ Visual disturbances ▪ Skeletal muscle weakness ▪ Paresthesias
Renal	
<ul style="list-style-type: none"> ▪ Decreased urine output 	<ul style="list-style-type: none"> ▪ Increased urine output if kidneys can compensate; decreased urine output if kidney damage is the cause
Integumentary	
<ul style="list-style-type: none"> ▪ Dry skin ▪ Poor turgor, tenting ▪ Dry mouth 	<ul style="list-style-type: none"> ▪ Pitting edema in dependent areas ▪ Pale, cool skin
Gastrointestinal	
<ul style="list-style-type: none"> ▪ Decreased motility and diminished bowel sounds ▪ Constipation ▪ Thirst ▪ Decreased body weight 	<ul style="list-style-type: none"> ▪ Increased motility in the gastrointestinal tract ▪ Diarrhea ▪ Increased body weight ▪ Liver enlargement ▪ Ascites
Laboratory Findings	
<ul style="list-style-type: none"> ▪ Increased serum osmolality ▪ Increased hematocrit ▪ Increased blood urea nitrogen (BUN) level ▪ Increased serum sodium level ▪ Increased urinary specific gravity 	<ul style="list-style-type: none"> ▪ Decreased serum osmolality ▪ Decreased hematocrit ▪ Decreased BUN level ▪ Decreased serum sodium level ▪ Decreased urine specific gravity

1. Monitor cardiovascular, respiratory, neuromuscular, renal, integumentary, and gastrointestinal status.
2. Prevent further fluid losses and increase fluid compartment volumes to normal ranges.
3. Provide oral rehydration therapy if possible and IV fluid replacement if the dehydration is severe; monitor intake and output.
4. In general, isotonic dehydration is treated with isotonic fluid solutions, hypertonic dehydration with hypotonic fluid solutions, and hypotonic dehydration with hypertonic fluid solutions.
5. Administer medications, such as antidiarrheal, antimicrobial, antiemetic, and antipyretic medications, as prescribed to correct the cause and treat any symptoms.
6. Monitor electrolyte values and prepare to administer medication to treat an imbalance, if present.

III. Fluid Volume Excess

A. Description

1. Fluid intake or fluid retention exceeds the fluid needs of the body.
2. Fluid volume excess is also called overhydration or fluid overload.
3. The goal of treatment is to restore fluid balance, correct electrolyte imbalances if present, and eliminate or control the underlying cause of the overload.

B. Types

1. Isotonic overhydration
 - a. Known as hypervolemia, isotonic overhydration results from excessive fluid in the extracellular fluid compartment.
 - b. Only the extracellular fluid compartment is expanded, and fluid does not shift between the extracellular and intracellular compartments.
 - c. Isotonic overhydration causes **circulatory overload** and interstitial edema; when severe or when it occurs in a client with poor cardiac function, heart failure and pulmonary edema can result.
2. Hypertonic overhydration
 - a. The occurrence of hypertonic overhydration is rare and is caused by an excessive **sodium** intake.
 - b. Fluid is drawn from the intracellular fluid compartment; the extracellular fluid volume expands, and the intracellular fluid volume contracts.
3. Hypotonic overhydration
 - a. Hypotonic overhydration is known as water intoxication.
 - b. The excessive fluid moves into the intracellular space, and all body fluid compartments expand.
 - c. Electrolyte imbalances occur as a result of dilution.

C. Causes

1. Isotonic overhydration
 - a. Inadequately controlled IV therapy
 - b. Kidney disease
 - c. Long-term corticosteroid therapy
2. Hypertonic overhydration
 - a. Excessive sodium ingestion
 - b. Rapid infusion of hypertonic saline
 - c. Excessive sodium bicarbonate therapy
3. Hypotonic overhydration
 - a. Early kidney disease
 - b. Heart failure
 - c. Syndrome of inappropriate antidiuretic hormone secretion
 - d. Inadequately controlled IV therapy
 - e. Replacement of isotonic fluid loss with hypotonic fluids
 - f. Irrigation of wounds and body cavities with hypotonic fluids

D. Assessment (see Table 8-1)

E. Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, renal, integumentary, and gastrointestinal status.
2. Prevent further fluid overload and restore normal fluid balance.
3. Administer diuretics; osmotic diuretics may be prescribed initially to prevent severe electrolyte imbalances.
4. Restrict fluid and sodium intake as prescribed.
5. Monitor intake and output; monitor weight.
6. Monitor electrolyte values, and prepare to administer medication to treat an imbalance if present.

! A client with acute kidney injury or chronic kidney disease is at high risk for fluid volume excess.

IV. Hypokalemia

A. Description

1. Hypokalemia is a **serum potassium** level lower than 3.5 mEq/L (3.5 mmol/L) (Box 8-2).
2. Potassium deficit is potentially life-threatening because every body system is affected.

BOX 8-2 Potassium

Normal Value

3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L)

Common Food Sources

Avocado, bananas, cantaloupe, oranges, strawberries, tomatoes
Carrots, mushrooms, spinach
Fish, pork, beef, veal
Potatoes
Raisins

B. Causes

1. Actual total body potassium loss
 - a. Excessive use of medications such as diuretics or corticosteroids
 - b. Increased secretion of aldosterone, such as in Cushing's syndrome
 - c. Vomiting, diarrhea
 - d. Wound drainage, particularly gastrointestinal
 - e. Prolonged nasogastric suction
 - f. Excessive diaphoresis
 - g. Kidney disease impairing reabsorption of potassium
2. Inadequate potassium intake: Fasting; nothing by mouth status
3. Movement of potassium from the extracellular fluid to the intracellular fluid
 - a. Alkalosis
 - b. Hyperinsulinism
4. Dilution of serum potassium
 - a. Water intoxication
 - b. IV therapy with potassium-deficient solutions

C. Assessment (Tables 8-2 and 8-3)

D. Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, gastrointestinal, and renal status, and place the client on a cardiac monitor.
2. Monitor electrolyte values.
3. Administer potassium supplements orally or intravenously, as prescribed.
4. Oral potassium supplements
 - a. Oral potassium supplements may cause nausea and vomiting and they should not be taken on an empty stomach; if the client complains of abdominal pain, distention, nausea, vomiting, diarrhea, or gastrointestinal bleeding, the supplement may need to be discontinued.
 - b. Liquid potassium chloride has an unpleasant taste and should be taken with juice or another liquid.
5. Intravenously administered potassium (Box 8-3)
6. Institute safety measures for the client experiencing muscle weakness.
7. If the client is taking a potassium-losing diuretic, it may be discontinued; a potassium-retaining diuretic may be prescribed.
8. Instruct the client about foods that are high in potassium content (see Box 8-2).

! Potassium is never administered by IV push, intramuscular, or subcutaneous routes. IV potassium is always diluted and administered using an infusion device!

V. Hyperkalemia

A. Description

1. Hyperkalemia is a serum potassium level that exceeds 5.0 mEq/L (5.0 mmol/L) (see Box 8-2).

TABLE 8-2 Assessment Findings: Hypokalemia and Hyperkalemia

Hypokalemia	Hyperkalemia
Cardiovascular	
<ul style="list-style-type: none"> ▪ Thready, weak, irregular pulse ▪ Weak peripheral pulses ▪ Orthostatic hypotension 	<ul style="list-style-type: none"> ▪ Slow, weak, irregular heart rate ▪ Decreased blood pressure
Respiratory	
<ul style="list-style-type: none"> ▪ Shallow, ineffective respirations that result from profound weakness of the skeletal muscles of respiration ▪ Diminished breath sounds 	<ul style="list-style-type: none"> ▪ Profound weakness of the skeletal muscles leading to respiratory failure
Neuromuscular	
<ul style="list-style-type: none"> ▪ Anxiety, lethargy, confusion, coma ▪ Skeletal muscle weakness, leg cramps 	<ul style="list-style-type: none"> ▪ Early: Muscle twitches, cramps, paresthasias (tingling and burning followed by numbness in the hands and feet and around the mouth) ▪ Late: Profound weakness, ascending flaccid paralysis in the arms and legs (trunk, head, and respiratory muscles become affected when the serum potassium level reaches a lethal level)
Gastrointestinal	
<ul style="list-style-type: none"> ▪ Decreased motility, hypoactive to absent bowel sounds ▪ Nausea, vomiting, constipation, abdominal distention ▪ Paralytic ileus 	<ul style="list-style-type: none"> ▪ Increased motility, hyperactive bowel sounds ▪ Diarrhea
Laboratory Findings	
<ul style="list-style-type: none"> ▪ Serum potassium level lower than 3.5 mEq/L (3.5 mmol/L) ▪ Electrocardiogram changes: ST depression; shallow, flat, or inverted T wave; and prominent U wave 	<ul style="list-style-type: none"> ▪ Serum potassium level that exceeds 5.0 mEq/L (5.0 mmol/L) ▪ Electrocardiographic changes: Tall peaked T waves, flat P waves, widened QRS complexes, and prolonged PR intervals

2. Pseudohyperkalemia: a condition that can occur due to methods of blood specimen collection and cell lysis; if an increased serum value is obtained in the absence of clinical symptoms, the specimen should be redrawn and evaluated.

B. Causes

1. Excessive potassium intake
 - a. Overingestion of potassium-containing foods or medications, such as potassium chloride or salt substitutes
 - b. Rapid infusion of potassium-containing IV solutions
2. Decreased potassium excretion

TABLE 8-3 Electrocardiographic Changes in Electrolyte Imbalances

Electrolyte Imbalance	Electrocardiographic Changes
Hypocalcemia	Prolonged ST segment Prolonged QT interval
Hypercalcemia	Shortened ST segment Widened T wave
Hypokalemia	ST depression Shallow, flat, or inverted T wave Prominent U wave
Hyperkalemia	Tall peaked T waves Flat P waves Widened QRS complexes Prolonged PR interval
Hypomagnesemia	Tall T waves Depressed ST segment
Hypermagnesemia	Prolonged PR interval Widened QRS complexes

- a. Potassium-retaining diuretics
 - b. Kidney disease
 - c. Adrenal insufficiency, such as in Addison's disease
3. Movement of potassium from the intracellular fluid to the extracellular fluid
 - a. Tissue damage
 - b. Acidosis
 - c. Hyperuricemia
 - d. Hypercatabolism

C. Assessment (see [Tables 8-2](#) and [8-3](#))

 **Monitor the client closely for signs of a potassium imbalance. A potassium imbalance can cause cardiac dysrhythmias that can be life-threatening!**

D. Interventions

1. Monitor cardiovascular, respiratory, neuromuscular, renal, and gastrointestinal status; place the client on a cardiac monitor.
2. Discontinue IV potassium (keep the IV catheter patent), and withhold oral potassium supplements.
3. Initiate a potassium-restricted diet.
4. Prepare to administer potassium-excreting diuretics if renal function is not impaired.
5. If renal function is impaired, prepare to administer sodium polystyrene sulfonate (oral or rectal route), a cation-exchange resin that promotes gastrointestinal sodium absorption and potassium excretion.
6. Prepare the client for dialysis if potassium levels are critically high.
7. Prepare for the administration of IV calcium if hyperkalemia is severe, to avert myocardial excitability.
8. Prepare for the IV administration of hypertonic glucose with regular insulin to move excess potassium into the cells.
9. When blood transfusions are prescribed for a client with a potassium imbalance, the client should receive fresh blood, if possible; transfusions of stored blood may elevate the potassium level because the breakdown of older blood cells releases potassium.
10. Teach the client to avoid foods high in potassium (see [Box 8-2](#)).
11. Instruct the client to avoid the use of salt substitutes or other potassium-containing substances.

 **Monitor the serum potassium level closely when a client is receiving a potassium-retaining diuretic!**

VI. Hyponatremia

A. Description

1. Hyponatremia is a serum sodium level lower than 135 mEq/L (135 mmol/L) ([Box 8-4](#)).

BOX 8-3 Precautions with Intravenously Administered Potassium

- Potassium is never given by intravenous (IV) push or by the intramuscular or subcutaneous route.
- A dilution of no more than 1 mEq/10 mL (1 mmol/10 mL) of solution is recommended.
- Many health care agencies supply prepared IV solutions containing potassium; before administering and frequently during infusion of the IV solution, rotate and invert the bag to ensure that the potassium is distributed evenly throughout the IV solution.
- Ensure that the IV bag containing potassium is properly labeled.
- The maximum recommended infusion rate is 5 to 10 mEq/hour (5 to 10 mmol/hour), never to exceed 20 mEq/hour (20 mmol/hour) under any circumstances.
- A client receiving more than 10 mEq/hour (10 mmol/hour) should be placed on a cardiac monitor and monitored for cardiac changes, and the infusion should be controlled by an infusion device.
- Potassium infusion can cause phlebitis; therefore, the nurse should assess the IV site frequently for signs of phlebitis or infiltration. If either occurs, the infusion should be stopped immediately.
- The nurse should assess renal function before administering potassium, and monitor intake and output during administration.

BOX 8-4 Sodium**Normal Value**

135 to 145 mEq/L (135 to 145 mmol/L)

Common Food Sources

Bacon, frankfurters, lunch meat
 Butter, cheese
 Canned food
 Ketchup, mustard
 Milk
 Processed food
 Snack foods
 Soy sauce
 Table salt

2. Sodium imbalances usually are associated with fluid volume imbalances.

B. Causes

1. Increased sodium excretion
 - a. Excessive diaphoresis
 - b. Diuretics
 - c. Vomiting
 - d. Diarrhea
 - e. Wound drainage, especially gastrointestinal
 - f. Kidney disease
 - g. Decreased secretion of aldosterone
2. Inadequate sodium intake
 - a. Fasting; nothing by mouth status
 - b. Low-salt diet
3. Dilution of serum sodium
 - a. Excessive ingestion of hypotonic fluids or irrigation with hypotonic fluids
 - b. Kidney disease
 - c. Freshwater drowning
 - d. Syndrome of inappropriate antidiuretic hormone secretion
 - e. Hyperglycemia
 - f. Heart failure

C. Assessment (Table 8-4)**D. Interventions**

1. Monitor cardiovascular, respiratory, neuromuscular, cerebral, renal, and gastrointestinal status.
2. If hyponatremia is accompanied by a **fluid volume deficit** (hypovolemia), IV sodium chloride infusions are administered to restore sodium content and fluid volume.
3. If hyponatremia is accompanied by **fluid volume excess** (hypervolemia), osmotic diuretics may be prescribed to promote the excretion of water rather than sodium.
4. If caused by inappropriate or excessive secretion of antidiuretic hormone, medications that antagonize antidiuretic hormone may be administered.

5. Instruct the client to increase oral sodium intake as prescribed and inform the client about the foods to include in the diet (see **Box 8-4**).
6. If the client is taking lithium, monitor the lithium level, because hyponatremia can cause diminished lithium excretion, resulting in toxicity.

 **Hyponatremia precipitates lithium toxicity in a client taking lithium.**

VII. Hypernatremia

A. Description: Hypernatremia is a **serum sodium** level that exceeds 145 mEq/L (145 mmol/L) (see **Box 8-4**).

B. Causes

1. Decreased sodium excretion
 - a. Corticosteroids
 - b. Cushing's syndrome
 - c. Kidney disease
 - d. Hyperaldosteronism
2. Increased sodium intake: Excessive oral sodium ingestion or excessive administration of sodium-containing IV fluids
3. Decreased water intake: Fasting; nothing by mouth status
4. Increased water loss: Increased rate of **metabolism**, fever, hyperventilation, infection, excessive diaphoresis, watery diarrhea, diabetes insipidus

C. Assessment (see Table 8-4)**D. Interventions**

1. Monitor cardiovascular, respiratory, neuromuscular, cerebral, renal, and integumentary status.
2. If the cause is fluid loss, prepare to administer IV infusions.
3. If the cause is inadequate renal excretion of sodium, prepare to administer diuretics that promote sodium loss.
4. Restrict sodium and fluid intake as prescribed (see **Box 8-4**).

VIII. Hypocalcemia

A. Description: Hypocalcemia is a **serum calcium** level lower than 9.0 mg/dL (2.25 mmol/L) (**Box 8-5**).

B. Causes

1. Inhibition of calcium absorption from the gastrointestinal tract
 - a. Inadequate oral intake of calcium
 - b. Lactose intolerance
 - c. Malabsorption syndromes such as celiac sprue or Crohn's disease
 - d. Inadequate intake of vitamin D
 - e. End-stage kidney disease
2. Increased calcium excretion
 - a. Kidney disease, polyuric phase
 - b. Diarrhea
 - c. Steatorrhea
 - d. Wound drainage, especially gastrointestinal

TABLE 8-4 Assessment Findings: Hyponatremia and Hypernatremia

Hyponatremia	Hypernatremia
Cardiovascular <ul style="list-style-type: none"> Symptoms vary with changes in vascular volume Normovolemic: Rapid pulse rate, normal blood pressure Hypovolemic: Thready, weak, rapid pulse rate; hypotension; flat neck veins; normal or low central venous pressure Hypervolemic: Rapid, bounding pulse; blood pressure normal or elevated; normal or elevated central venous pressure 	<ul style="list-style-type: none"> Heart rate and blood pressure respond to vascular volume status
Respiratory <ul style="list-style-type: none"> Shallow, ineffective respiratory movement is a late manifestation related to skeletal muscle weakness 	<ul style="list-style-type: none"> Pulmonary edema if hypervolemia is present
Neuromuscular <ul style="list-style-type: none"> Generalized skeletal muscle weakness that is worse in the extremities Diminished deep tendon reflexes 	<ul style="list-style-type: none"> Early: Spontaneous muscle twitches; irregular muscle contractions Late: Skeletal muscle weakness; deep tendon reflexes diminished or absent
Central Nervous System <ul style="list-style-type: none"> Headache Personality changes Confusion Seizures Coma 	<ul style="list-style-type: none"> Altered cerebral function is the most common manifestation of hypernatremia Normovolemia or hypovolemia: Agitation, confusion, seizures Hypervolemia: Lethargy, stupor, coma
Gastrointestinal <ul style="list-style-type: none"> Increased motility and hyperactive bowel sounds Nausea Abdominal cramping and diarrhea 	<ul style="list-style-type: none"> Extreme thirst
Renal <ul style="list-style-type: none"> Increased urinary output 	<ul style="list-style-type: none"> Decreased urinary output
Integumentary <ul style="list-style-type: none"> Dry mucous membranes 	<ul style="list-style-type: none"> Dry and flushed skin Dry and sticky tongue and mucous membranes Presence or absence of edema, depending on fluid volume changes
Laboratory Findings <ul style="list-style-type: none"> Serum sodium level less than 135 mEq/L (135 mmol/L) Decreased urinary specific gravity 	<ul style="list-style-type: none"> Serum sodium level that exceeds 145 mEq/L (145 mmol/L) Increased urinary specific gravity

BOX 8-5 Calcium**Normal Value**

9.0 to 10.5 mg/dL (2.25 to 2.75 mmol/L)

Common Food Sources

Cheese
 Collard greens
 Kale
 Milk and soy milk
 Rhubarb
 Sardines
 Tofu
 Yogurt

3. Conditions that decrease the ionized fraction of calcium
 - a. Hyperproteinemia
 - b. Alkalosis
 - c. Medications such as calcium chelators or binders
 - d. Acute pancreatitis
 - e. Hyperphosphatemia
 - f. Immobility
 - g. Removal or destruction of the parathyroid glands
- C. Assessment (Table 8-5 and Fig. 8-3; also see Table 8-3)
- D. Interventions

TABLE 8-5 Assessment Findings: Hypocalcemia and Hypercalcemia

Hypocalcemia	Hypercalcemia
Cardiovascular <ul style="list-style-type: none"> Decreased heart rate Hypotension Diminished peripheral pulses 	<ul style="list-style-type: none"> Increased heart rate in the early phase; bradycardia that can lead to cardiac arrest in late phases Increased blood pressure Bounding, full peripheral pulses
Respiratory <ul style="list-style-type: none"> Not directly affected; however, respiratory failure or arrest can result from decreased respiratory movement because of muscle tetany or seizures 	<ul style="list-style-type: none"> Ineffective respiratory movement as a result of profound skeletal muscle weakness
Neuromuscular <ul style="list-style-type: none"> Irritable skeletal muscles: Twitches, cramps, tetany, seizures Painful muscle spasms in the calf or foot during periods of inactivity Paresthesias followed by numbness that may affect the lips, nose, and ears in addition to the limbs Positive Trousseau's and Chvostek's signs Hyperactive deep tendon reflexes Anxiety, irritability 	<ul style="list-style-type: none"> Profound muscle weakness Diminished or absent deep tendon reflexes Disorientation, lethargy, coma
Renal <ul style="list-style-type: none"> Urinary output varies depending on the cause 	<ul style="list-style-type: none"> Urinary output varies depending on the cause
Gastrointestinal <ul style="list-style-type: none"> Increased gastric motility; hyperactive bowel sounds Cramping, diarrhea 	<ul style="list-style-type: none"> Decreased motility and hypoactive bowel sounds Anorexia, nausea, abdominal distention, constipation
Laboratory Findings <ul style="list-style-type: none"> Serum calcium level less than 9.0 mg/dL (2.25 mmol/L) Electrocardiographic changes: Prolonged ST interval, prolonged QT interval 	<ul style="list-style-type: none"> Serum calcium level that exceeds 10.5 mg/dL (2.75 mmol/L) Electrocardiographic changes: Shortened ST segment, widened T wave

FIGURE 8-3 Tests for hypocalcemia. A, Chvostek's sign is contraction of facial muscles in response to a light tap over the facial nerve in front of the ear. B, Trousseau's sign is a carpal spasm induced by inflating a blood pressure cuff (C) above the systolic pressure for a few minutes.

1. Monitor cardiovascular, respiratory, neuromuscular, and gastrointestinal status; place the client on a cardiac monitor.
2. Administer calcium supplements orally or calcium intravenously.
3. When administering calcium intravenously, warm the injection solution to body temperature before administration and administer slowly; monitor for electrocardiographic changes, observe for infiltration, and monitor for hypercalcemia.
4. Administer medications that increase calcium absorption.
 - a. Aluminum hydroxide reduces phosphorus levels, causing the countereffect of increasing calcium levels.
 - b. Vitamin D aids in the absorption of calcium from the intestinal tract.
5. Provide a quiet environment to reduce environmental stimuli.
6. Initiate seizure precautions.
7. Move the client carefully, and monitor for signs of a pathological fracture.
8. Keep 10% calcium gluconate available for treatment of acute calcium deficit.

9. Instruct the client to consume foods high in calcium (see [Box 8-5](#)).

IX. Hypercalcemia

- A. Description: Hypercalcemia is a **serum calcium** level that exceeds 10.5 mg/dL (2.75 mmol/L) (see [Box 8-5](#)).
- B. Causes
 1. Increased calcium absorption
 - a. Excessive oral intake of calcium
 - b. Excessive oral intake of vitamin D
 2. Decreased calcium excretion
 - a. Kidney disease
 - b. Use of thiazide diuretics
 3. Increased bone resorption of calcium
 - a. Hyperparathyroidism
 - b. Hyperthyroidism
 - c. Malignancy (bone destruction from metastatic tumors)
 - d. Immobility
 - e. Use of glucocorticoids
 4. Hemoconcentration
 - a. Dehydration
 - b. Use of lithium
 - c. Adrenal insufficiency
- C. Assessment (see [Tables 8-3](#) and [8-5](#))
- D. Interventions
 1. Monitor cardiovascular, respiratory, neuromuscular, renal, and gastrointestinal status; place the client on a cardiac monitor.
 2. Discontinue IV infusions of solutions containing calcium and oral medications containing calcium or vitamin D.
 3. Thiazide diuretics may be discontinued and replaced with diuretics that enhance the excretion of calcium.
 4. Administer medications as prescribed that inhibit calcium resorption from the bone, such as phosphorus, calcitonin, bisphosphonates, and prostaglandin synthesis inhibitors (acetylsalicylic acid, nonsteroidal antiinflammatory medications).
 5. Prepare the client with severe hypercalcemia for dialysis if medications fail to reduce the serum calcium level.
 6. Move the client carefully and monitor for signs of a pathological fracture.
 7. Monitor for flank or abdominal pain, and strain the urine to check for the presence of urinary stones.
 8. Instruct the client to avoid foods high in calcium (see [Box 8-5](#)).

 A client with a calcium imbalance is at risk for a pathological fracture. Move the client carefully and slowly; assist the client with ambulation.

X. Hypomagnesemia

- A. Description: Hypomagnesemia is a **serum magnesium** level lower than 1.3 mEq/L (0.65 mmol/L) ([Box 8-6](#)).

BOX 8-6 Magnesium

Normal Value

1.3 to 2.1 mEq/L (0.65 to 1.05 mmol/L)

Common Food Sources

Avocado
 Canned white tuna
 Cauliflower
 Green leafy vegetables, such as spinach and broccoli
 Milk
 Oatmeal, wheat bran
 Peanut butter, almonds
 Peas
 Pork, beef, chicken, soybeans
 Potatoes
 Raisins
 Yogurt

- B. Causes
 1. Insufficient magnesium intake
 - a. Malnutrition and starvation
 - b. Vomiting or diarrhea
 - c. Malabsorption syndrome
 - d. Celiac disease
 - e. Crohn's disease
 2. Increased magnesium excretion
 - a. Medications such as diuretics
 - b. Chronic alcoholism
 3. Intracellular movement of magnesium
 - a. Hyperglycemia
 - b. Insulin administration
 - c. Sepsis
- C. Assessment ([Table 8-6](#); also see [Table 8-3](#))
- D. Interventions
 1. Monitor cardiovascular, respiratory, gastrointestinal, neuromuscular, and central nervous system status; place the client on a cardiac monitor.
 2. Because hypocalcemia frequently accompanies hypomagnesemia, interventions also aim to restore normal serum calcium levels.
 3. Oral preparations of magnesium may cause diarrhea and increase magnesium loss.
 4. Magnesium sulfate by the IV route may be prescribed in ill clients when the magnesium level is low (intramuscular injections cause pain and tissue damage); initiate seizure precautions, monitor serum magnesium levels frequently, and monitor for diminished deep tendon reflexes, suggesting hypermagnesemia, during the administration of magnesium.
 5. Instruct the client to increase the intake of foods that contain magnesium (see [Box 8-6](#)).

XI. Hypermagnesemia

- A. Description: Hypermagnesemia is a **serum magnesium** level that exceeds 2.1 mEq/L (1.05 mmol/L) (see [Box 8-6](#)).

TABLE 8-6 Assessment Findings: Hypomagnesemia and Hypermagnesemia

Hypomagnesemia	Hypermagnesemia
Cardiovascular	
<ul style="list-style-type: none"> Tachycardia Hypertension 	<ul style="list-style-type: none"> Bradycardia, dysrhythmias Hypotension
Respiratory	
<ul style="list-style-type: none"> Shallow respirations 	<ul style="list-style-type: none"> Respiratory insufficiency when the skeletal muscles of respiration are involved
Neuromuscular	
<ul style="list-style-type: none"> Twitches, paresthesias Positive Trousseau's and Chvostek's signs Hyperreflexia Tetany, seizures 	<ul style="list-style-type: none"> Diminished or absent deep tendon reflexes Skeletal muscle weakness
Central Nervous System	
<ul style="list-style-type: none"> Irritability Confusion 	<ul style="list-style-type: none"> Drowsiness and lethargy that progresses to coma
Laboratory Findings	
<ul style="list-style-type: none"> Serum magnesium level less than 1.3 mEq/L (0.65 mmol/L) Electrocardiographic changes: Tall T waves, depressed ST segments 	<ul style="list-style-type: none"> Serum magnesium level that exceeds 2.1 mEq/L (1.05 mmol/L) Electrocardiographic changes: Prolonged PR interval, widened QRS complexes

B. Causes

- Increased magnesium intake
 - Magnesium-containing antacids and laxatives
 - Excessive administration of magnesium intravenously
- Decreased renal excretion of magnesium as a result of renal insufficiency

C. Assessment (see Tables 8-3 and 8-6)

D. Interventions

- Monitor cardiovascular, respiratory, neuromuscular, and central nervous system status; place the client on a cardiac monitor.
- Diuretics are prescribed to increase renal excretion of magnesium.
- Intravenously administered calcium chloride or calcium gluconate may be prescribed to reverse the effects of magnesium on cardiac muscle.
- Instruct the client to restrict dietary intake of magnesium-containing foods (see Box 8-6).
- Instruct the client to avoid the use of laxatives and antacids containing magnesium.

 **Calcium gluconate is the antidote for magnesium overdose.**

BOX 8-7 Phosphorus (Phosphate)

Normal Value

3.0 to 4.5 mg/dL (0.97 to 1.45 mmol/L)

Common Food Sources

Dairy products
Fish
Nuts
Pork, beef, chicken, organ meats
Pumpkin, squash
Whole-grain breads and cereals

XII. Hypophosphatemia

A. Description

- Hypophosphatemia is a **serum phosphorus** (phosphate) level lower than 3.0 mg/dL (0.97 mmol/L) (Box 8-7).
- A decrease in the serum phosphorus level is accompanied by an increase in the serum **calcium** level.

B. Causes

- Insufficient phosphorus intake: **Malnutrition** and starvation
- Increased phosphorus excretion
 - Hyperparathyroidism
 - Malignancy
 - Use of **magnesium**-based or aluminum hydroxide-based antacids
- Intracellular shift
 - Hyperglycemia
 - Respiratory alkalosis**

C. Assessment

- Cardiovascular
 - Decreased contractility and cardiac output
 - Slowed peripheral pulses
- Respiratory: Shallow respirations
- Neuromuscular
 - Weakness
 - Decreased deep tendon reflexes
 - Decreased bone density that can cause fractures and alterations in bone shape
 - Rhabdomyolysis
- Central nervous system
 - Irritability
 - Confusion
 - Seizures
- Hematological
 - Decreased platelet aggregation and increased bleeding
 - Immunosuppression

D. Interventions

- Monitor cardiovascular, respiratory, neuromuscular, central nervous system, and hematological status.

2. Discontinue medications that contribute to hypophosphatemia.
3. Administer phosphorus orally along with a vitamin D supplement.
4. Prepare to administer phosphorus intravenously when serum phosphorus levels fall below 1 mg/dL and when the client experiences critical clinical manifestations.
5. Administer IV phosphorus slowly because of the risks associated with hyperphosphatemia.
6. Assess the renal system before administering phosphorus.
7. Move the client carefully, and monitor for signs of a pathological fracture.
8. Instruct the client to increase the intake of the phosphorus-containing foods while decreasing the intake of any calcium-containing foods (see Boxes 8-5 and 8-7).

 A decrease in the serum phosphorus level is accompanied by an increase in the serum calcium level, and an increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level. This is called a reciprocal relationship.

XIII. Hyperphosphatemia

A. Description

1. Hyperphosphatemia is a serum phosphorus level that exceeds 4.5 mg/dL (1.45 mmol/L) (see Box 8-7).
2. Most body systems tolerate elevated serum phosphorus levels well.
3. An increase in the serum phosphorus level is accompanied by a decrease in the serum calcium level.
4. The problems that occur in hyperphosphatemia center on the hypocalcemia that results when serum phosphorus levels increase.

B. Causes

1. Decreased renal excretion resulting from renal insufficiency
2. Tumor lysis syndrome
3. Increased intake of phosphorus, including dietary intake or overuse of phosphate-containing laxatives or enemas
4. Hypoparathyroidism

C. Assessment: Refer to assessment of hypocalcemia.

D. Interventions

1. Interventions entail the management of hypocalcemia.
2. Administer phosphate-binding medications that increase fecal excretion of phosphorus by binding phosphorus from food in the gastrointestinal tract.
3. Instruct the client to avoid phosphate-containing medications, including laxatives and enemas.
4. Instruct the client to decrease the intake of food that is high in phosphorus (see Box 8-7).

5. Instruct the client in medication administration: Take phosphate-binding medications, emphasizing that they should be taken with meals or immediately after meals.

CRITICAL THINKING What Should You Do?

Answer: Cardiac changes in hypokalemia include impaired repolarization, resulting in a flattening of the T wave and eventually the emergence of a U wave. Therefore, the nurse should suspect hypokalemia. The incidence of potentially lethal ventricular dysrhythmias is increased in hypokalemia. The nurse should immediately assess the client's vital signs and cardiac status for signs of hypokalemia. The nurse should also check the client's most recent serum potassium level and then contact the health care provider to report the findings and obtain prescriptions to treat the hypokalemic state.

Reference: Lewis et al. (2014), pp. 297–298.

PRACTICE QUESTIONS

36. The nurse is caring for a client with heart failure. On assessment, the nurse notes that the client is dyspneic, and crackles are audible on auscultation. What additional manifestations would the nurse expect to note in this client if excess fluid volume is present?
 1. Weight loss and dry skin
 2. Flat neck and hand veins and decreased urinary output
 3. An increase in blood pressure and increased respirations
 4. Weakness and decreased central venous pressure (CVP)
37. The nurse is preparing to care for a client with a potassium deficit. The nurse reviews the client's record and determines that the client is at risk for developing the potassium deficit because of which situation?
 1. Sustained tissue damage
 2. Requires nasogastric suction
 3. Has a history of Addison's disease
 4. Uric acid level of 9.4 mg/dL (559 μmol/L)
- ❖ 38. The nurse reviews a client's electrolyte laboratory report and notes that the potassium level is 2.5 mEq/L (2.5 mmol/L). Which patterns should the nurse watch for on the electrocardiogram (ECG) as a result of the laboratory value? Select all that apply.
 - 1. U waves
 - 2. Absent P waves
 - 3. Inverted T waves
 - 4. Depressed ST segment
 - 5. Widened QRS complex

- ❖ 39. Potassium chloride intravenously is prescribed for a client with hypokalemia. Which actions should the nurse take to plan for preparation and administration of the potassium? Select all that apply.
- 1. Obtain an intravenous (IV) infusion pump.
 - 2. Monitor urine output during administration.
 - 3. Prepare the medication for bolus administration.
 - 4. Monitor the IV site for signs of infiltration or phlebitis.
 - 5. Ensure that the medication is diluted in the appropriate volume of fluid.
 - 6. Ensure that the bag is labeled so that it reads the volume of potassium in the solution.
- ❖ 40. The nurse provides instructions to a client with a low potassium level about the foods that are high in potassium and tells the client to consume which foods? Select all that apply.
- 1. Peas
 - 2. Raisins
 - 3. Potatoes
 - 4. Cantaloupe
 - 5. Cauliflower
 - 6. Strawberries
- ❖ 41. The nurse is reviewing laboratory results and notes that a client's serum sodium level is 150 mEq/L (150 mmol/L). The nurse reports the serum sodium level to the health care provider (HCP) and the HCP prescribes dietary instructions based on the sodium level. Which acceptable food items does the nurse instruct the client to consume? Select all that apply.
- 1. Peas
 - 2. Nuts
 - 3. Cheese
 - 4. Cauliflower
 - 5. Processed oat cereals
42. The nurse is assessing a client with a suspected diagnosis of hypocalcemia. Which clinical manifestation would the nurse expect to note in the client?
1. Twitching
 2. Hypoactive bowel sounds
 3. Negative Trousseau's sign
 4. Hypoactive deep tendon reflexes
- ❖ 43. The nurse is caring for a client with hypocalcemia. Which patterns would the nurse watch for on the electrocardiogram as a result of the laboratory value? Select all that apply.
- 1. U waves
 - 2. Widened T wave
 - 3. Prominent U wave
 - 4. Prolonged QT interval
 - 5. Prolonged ST segment
- ❖ 44. The nurse reviews the electrolyte results of an assigned client and notes that the potassium level is 5.7 mEq/L (5.7 mmol/L). Which patterns would the nurse watch for on the cardiac monitor as a result of the laboratory value? Select all that apply.
- 1. ST depression
 - 2. Prominent U wave
 - 3. Tall peaked T waves
 - 4. Prolonged ST segment
 - 5. Widened QRS complexes
45. Which client is at risk for the development of a sodium level at 130 mEq/L (130 mmol/L)?
1. The client who is taking diuretics
 2. The client with hyperaldosteronism
 3. The client with Cushing's syndrome
 4. The client who is taking corticosteroids
46. The nurse is caring for a client with heart failure who is receiving high doses of a diuretic. On assessment, the nurse notes that the client has flat neck veins, generalized muscle weakness, and diminished deep tendon reflexes. The nurse suspects hyponatremia. What additional signs would the nurse expect to note in a client with hyponatremia?
1. Muscle twitches
 2. Decreased urinary output
 3. Hyperactive bowel sounds
 4. Increased specific gravity of the urine
47. The nurse reviews a client's laboratory report and notes that the client's serum phosphorus (phosphate) level is 1.8 mg/dL (0.45 mmol/L). Which condition most likely caused this serum phosphorus level?
1. Malnutrition
 2. Renal insufficiency
 3. Hypoparathyroidism
 4. Tumor lysis syndrome
48. The nurse is reading a health care provider's (HCP's) progress notes in the client's record and reads that the HCP has documented "insensible fluid loss of approximately 800 mL daily." The nurse makes a notation that insensible fluid loss occurs through which type of excretion?
1. Urinary output
 2. Wound drainage
 3. Integumentary output
 4. The gastrointestinal tract
49. The nurse is assigned to care for a group of clients. On review of the clients' medical records, the nurse determines that which client is most likely at risk for a fluid volume deficit?
1. A client with an ileostomy
 2. A client with heart failure

3. A client on long-term corticosteroid therapy
 4. A client receiving frequent wound irrigations
50. The nurse caring for a client who has been receiving intravenous (IV) diuretics suspects that the client is experiencing a fluid volume deficit. Which assessment finding would the nurse note in a client with this condition?
1. Weight loss and poor skin turgor
 2. Lung congestion and increased heart rate
 3. Decreased hematocrit and increased urine output
 4. Increased respirations and increased blood pressure
51. On review of the clients' medical records, the nurse determines that which client is at risk for fluid volume excess?
1. The client taking diuretics and has tenting of the skin
 2. The client with an ileostomy from a recent abdominal surgery
 3. The client who requires intermittent gastrointestinal suctioning
 4. The client with kidney disease and a 12-year history of diabetes mellitus
52. Which client is at risk for the development of a potassium level of 5.5 mEq/L (5.5 mmol/L)?
1. The client with colitis
 2. The client with Cushing's syndrome
 3. The client who has been overusing laxatives
 4. The client who has sustained a traumatic burn

ANSWERS

36. 3

Rationale: A fluid volume excess is also known as overhydration or fluid overload and occurs when fluid intake or fluid retention exceeds the fluid needs of the body. Assessment findings associated with fluid volume excess include cough, dyspnea, crackles, tachypnea, tachycardia, elevated blood pressure, bounding pulse, elevated CVP, weight gain, edema, neck and hand vein distention, altered level of consciousness, and decreased hematocrit. Dry skin, flat neck and hand veins, decreased urinary output, and decreased CVP are noted in fluid volume deficit. Weakness can be present in either fluid volume excess or deficit.

Test-Taking Strategy: Focus on the **subject**, fluid volume excess. Remember that when there is more than one part to an option, all parts need to be correct in order for the option to be correct. Think about the pathophysiology associated with a fluid volume excess to assist in directing you to the correct option. Also, note that the incorrect options are **comparable or alike** in that each includes manifestations that reflect a decrease.

Review: The assessment findings noted in **fluid volume excess**

Level of Cognitive Ability: Synthesizing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Fluids & Electrolytes

Priority Concepts: Fluid and Electrolytes; Perfusion

References: Ignatavicius, Workman (2016), pp. 158–159; Lewis et al. (2014), pp. 292–293.

37. 2

Rationale: The normal serum potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A potassium deficit is known as hypokalemia. Potassium-rich gastrointestinal fluids are lost through gastrointestinal suction, placing the client at risk for hypokalemia. The client with tissue damage or Addison's disease and the client with hyperuricemia are at risk for hyperkalemia. The normal uric acid level for a female is 2.7 to 7.3 mg/dL (0.16 to 0.43 mmol/L) and for a male is 4.0 to 8.5 mg/dL (0.24 to 0.51 mmol/L). Hyperuricemia is a cause of hyperkalemia.

Test-Taking Strategy: Note that the **subject** of the question is potassium deficit. First recall the normal uric acid levels and the causes of hypokalemia to assist in eliminating option 4. For the remaining options, note that the correct option is the only one that identifies a loss of body fluid.

Review: The causes of **hypokalemia**

❖ 38. 1, 3, 4

Rationale: The normal serum potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). A serum potassium level lower than 3.5 mEq/L (3.5 mmol/L) indicates hypokalemia. Potassium deficit is an electrolyte imbalance that can be potentially life-threatening. Electrocardiographic changes include shallow, flat, or inverted T waves; ST segment depression; and prominent U waves. Absent P waves are not a characteristic of hypokalemia but may be noted in a client with atrial fibrillation, junctional rhythms, or ventricular rhythms. A widened QRS complex may be noted in hyperkalemia and in hypermagnesemia.

Test-Taking Strategy: Focus on the **subject**, the ECG patterns that may be noted with a client with a potassium level of 2.5 mEq/L (2.5 mmol/L). From the information in the question, you need to determine that the client is experiencing severe hypokalemia. From this point, you must know the electrocardiographic changes that are expected when severe hypokalemia exists.

Review: The electrocardiographic changes that occur in **hypokalemia**

❖ 39. 1, 2, 4, 5, 6

Rationale: Potassium chloride administered intravenously must always be diluted in IV fluid and infused via an infusion pump. Potassium chloride is never given by bolus (IV push). Giving potassium chloride by IV push can result in cardiac arrest. The nurse should ensure that the potassium is diluted in the appropriate amount of diluent or fluid. The IV bag containing the potassium chloride should always be labeled with the volume of potassium it contains. The IV site is monitored closely because potassium chloride is irritating to the veins and there is risk of phlebitis. In addition, the nurse should monitor for infiltration. The nurse monitors urinary output during administration and contacts the health care provider if the urinary output is less than 30 mL/hour.

Test-Taking Strategy: Focus on the **subject**, the preparation and administration of potassium chloride intravenously. Think about this procedure and the effects of potassium. Note the word bolus in option 3 to assist in eliminating this option.

Review: The precautions with intravenously administered **potassium**

❖ 40. 2, 3, 4, 6

Rationale: The normal potassium level is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). Common food sources of potassium include avocado, bananas, cantaloupe, carrots, fish, mushrooms, oranges, potatoes, pork, beef, veal, raisins, spinach, strawberries, and tomatoes. Peas and cauliflower are high in magnesium.

Test-Taking Strategy: Focus on the **subject**, foods high in potassium. Read each food item and use knowledge about nutrition and components of food. Recall that peas and cauliflower are high in magnesium.

Review: The food items high in **potassium** content

❖ 41. 1, 2, 4

Rationale: The normal serum sodium level is 135 to 145 mEq/L (135 to 145 mmol/L). A serum sodium level of 150 mEq/L (150 mmol/L) indicates hypernatremia. On the basis of this finding, the nurse would instruct the client to avoid foods high in sodium. Peas, nuts, and cauliflower are good food sources of phosphorus and are not high in sodium (unless they are canned or salted). Peas are also a good source of magnesium. Processed foods such as cheese and processed oat cereals are high in sodium content.

Test-Taking Strategy: Focus on the **subject**, foods acceptable to be consumed by a client with a sodium level of 150 mEq/L (150 mmol/L). First, you must determine that the client has

hypernatremia. Select peas and cauliflower first because these are vegetables. From the remaining options, note the word processed in option 5 and recall that cheese is high in sodium. Remember that processed foods tend to be higher in sodium content.

Review: Foods high in **sodium** content

42. 1

Rationale: The normal serum calcium level is 9 to 10.5 mg/dL (2.25 to 2.75 mmol/L). A serum calcium level lower than 9 mg/dL (2.25 mmol/L) indicates hypocalcemia. Signs of hypocalcemia include paresthesias followed by numbness, hyperactive deep tendon reflexes, and a positive Trousseau's or Chvostek's sign. Additional signs of hypocalcemia include increased neuromuscular excitability, muscle cramps, twitching, tetany, seizures, irritability, and anxiety. Gastrointestinal symptoms include increased gastric motility, hyperactive bowel sounds, abdominal cramping, and diarrhea.

Test-Taking Strategy: Note that the three incorrect options are **comparable or alike** in that they reflect a hypoactivity. The option that is different is the correct option.

49. 1

Rationale: A fluid volume deficit occurs when the fluid intake is not sufficient to meet the fluid needs of the body. Causes of a fluid volume deficit include vomiting, diarrhea, conditions that cause increased respirations or increased urinary output, insufficient intravenous fluid replacement, draining fistulas,

and the presence of an ileostomy or colostomy. A client with heart failure or on long-term corticosteroid therapy or a client receiving frequent wound irrigations is most at risk for fluid volume excess.

Test-Taking Strategy: Note the **strategic words**, most likely. Read the question carefully, noting the **subject**, the client at risk for a deficit. Read each option and think about the fluid imbalance that can occur in each. The clients with heart failure, on long-term corticosteroid therapy, and receiving frequent wound irrigations retain fluid. The only condition that can cause a deficit is the condition noted in the correct option.

Review: The causes of a **fluid volume deficit**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

50. 1

Rationale: A fluid volume deficit occurs when the fluid intake is not sufficient to meet the fluid needs of the body. Assessment findings in a client with a fluid volume deficit include increased respirations and heart rate, decreased central venous pressure (CVP) (normal CVP is between 4 and 11 cm H₂O), weight loss, poor skin turgor, dry mucous membranes, decreased urine volume, increased specific gravity of the urine, increased hematocrit, and altered level of consciousness. Lung congestion, increased urinary output, and increased blood pressure are all associated with fluid volume excess.

Test-Taking Strategy: Focus on the **subject**, fluid volume deficit. Think about the pathophysiology for fluid volume deficit and fluid volume excess to answer correctly. Note that options 2, 3, and 4 are **comparable or alike** and are manifestations associated with fluid volume excess.

Review: The assessment findings noted in **fluid volume deficit**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Fluids & Electrolytes

Priority Concepts: Clinical Judgment; Fluid and Electrolytes

Reference: Lewis et al. (2014), p. 292.

51. 4

Rationale: A fluid volume excess is also known as overhydration or fluid overload and occurs when fluid intake or fluid retention

exceeds the fluid needs of the body. The causes of fluid volume excess include decreased kidney function, heart failure, use of hypotonic fluids to replace isotonic fluid losses, excessive irrigation of wounds and body cavities, and excessive ingestion of sodium. The client taking diuretics, the client with an ileostomy, and the client who requires gastrointestinal suctioning are at risk for fluid volume deficit.

Test-Taking Strategy: Focus on the **subject**, fluid volume excess. Think about the pathophysiology associated with fluid volume excess. Read each option and think about the fluid imbalance that can occur in each. Clients taking diuretics or having ileostomies or gastrointestinal suctioning all lose fluid. The only condition that can cause an excess is the condition noted in the correct option.

Review: The causes of **fluid volume excess**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Fluids & Electrolytes

Priority Concepts: Clinical Judgment; Fluid and Electrolytes

Acid-Base Balance

PRIORITY CONCEPTS Acid-Base Balance; Oxygenation

CRITICAL THINKING What Should You Do?

The nurse performs an Allen's test on a client scheduled for an arterial blood gas draw from the radial artery. On release of pressure from the ulnar artery, color in the hand returns after 20 seconds. The nurse should take which actions? Answer located on p. 103.

I. Hydrogen Ions, Acids, and Bases

A. Hydrogen ions

1. Vital to life and expressed as pH.
2. Circulate in the body in 2 forms:
 - a. Volatile hydrogen of carbonic acid
 - b. Nonvolatile form of hydrogen and organic acids

B. Acids

1. Acids are produced as end products of **metabolism**.
2. Acids contain hydrogen ions and are hydrogen ion donors, which means that acids give up hydrogen ions to neutralize or decrease the strength of an acid or to form a weaker base.
3. The strength of an acid is determined by the number of hydrogen ions it contains.
4. The number of hydrogen ions in body fluid determines its acidity, alkalinity, or neutrality.
5. The lungs excrete 13,000 to 30,000 mEq/day of volatile hydrogen in the form of carbonic acid as carbon dioxide (CO₂).
6. The kidneys excrete 50 mEq/day of nonvolatile acids.

C. Bases

1. Contain no hydrogen ions.
2. Are hydrogen ion acceptors; they accept hydrogen ions from acids to neutralize or decrease the strength of a base or to form a weaker acid.

II. Regulatory Systems for Hydrogen Ion Concentration in the Blood

A. Buffers

1. Buffers are the fastest acting regulatory system.

2. Buffers provide immediate protection against changes in hydrogen ion concentration in the extracellular fluid.
3. Buffers are reactors that function only to keep the pH within the narrow limits of stability when too much acid or base is released into the system, and buffers absorb or release hydrogen ions as needed.
4. Buffers serve as a transport mechanism that carries excess hydrogen ions to the lungs.
5. Once the primary buffer systems react, they are consumed, leaving the body less able to withstand further stress until the buffers are replaced.

B. Primary buffer systems in extracellular fluid

1. Hemoglobin system
 - a. System maintains acid-base balance by a process called chloride shift.
 - b. Chloride shifts in and out of the cells in response to the level of oxygen (O₂) in the blood.
 - c. For each chloride ion that leaves a red blood cell, a bicarbonate ion enters.
 - d. For each chloride ion that enters a red blood cell, a bicarbonate ion leaves.
2. **Plasma** protein system
 - a. The system functions along with the liver to vary the amount of hydrogen ions in the chemical structure of plasma proteins.
 - b. Plasma proteins have the ability to attract or release hydrogen ions.
3. Carbonic acid–bicarbonate system
 - a. Primary buffer system in the body.
 - b. The system maintains a pH of 7.4 with a ratio of 20 parts bicarbonate (HCO₃^A) to 1 part carbonic acid (H₂CO₃) (Fig. 9-1).
 - c. This ratio (20:1) determines the hydrogen ion concentration of body fluid.
 - d. Carbonic acid concentration is controlled by the excretion of CO₂ by the lungs; the rate and depth of respiration change in response to changes in the CO₂.

FIGURE 9-1 Acid-base balance. In the healthy state, a ratio of 1 part carbonic acid to 20 parts bicarbonate provides a normal serum pH between 7.35 and 7.45. Any deviation to the left of 7.35 results in an acidotic state. Any deviation to the right of 7.45 results in an alkalotic state.

e. The kidneys control the bicarbonate concentration and selectively retain or excrete bicarbonate in response to bodily needs.

4. Phosphate buffer system

- System is present in the cells and body fluids and is especially active in the kidneys.
- System acts like bicarbonate and neutralizes excess hydrogen ions.

C. Lungs

- The lungs are the second defense of the body and interact with the buffer system to maintain acid-base balance.
- In acidosis, the pH decreases and the respiratory rate and depth increase in an attempt to exhale acids. The carbonic acid created by the neutralizing action of bicarbonate can be carried to the lungs, where it is reduced to CO_2 and water and is exhaled; thus hydrogen ions are inactivated and exhaled.
- In alkalosis, the pH increases and the respiratory rate and depth decrease; CO_2 is retained and carbonic acid increases to neutralize and decrease the strength of excess bicarbonate.
- The action of the lungs is reversible in controlling an excess or deficit.
- The lungs can hold hydrogen ions until the deficit is corrected or can inactivate hydrogen ions, changing the ions to water molecules to be exhaled along with CO_2 , thus correcting the excess.
- The process of correcting a deficit or excess takes 10 to 30 seconds to complete.
- The lungs are capable of inactivating only hydrogen ions carried by carbonic acid; excess hydrogen ions created by other mechanisms must be excreted by the kidneys.

! Monitor the client's respiratory status closely. In acidosis, the respiratory rate and depth increase in an attempt to exhale acids. In alkalosis, the respiratory rate and depth decrease; CO_2 is retained to neutralize and decrease the strength of excess bicarbonate.

D. Kidneys

- The kidneys provide a more inclusive corrective response to acid-base disturbances than other corrective mechanisms, even though the renal excretion of acids and alkalis occurs more slowly.
- Compensation** requires a few hours to several days; however, the compensation is more thorough and selective than that of other regulators, such as the buffer systems and lungs.
- In acidosis, the pH decreases and excess hydrogen ions are secreted into the tubules and combine with buffers for excretion in the urine.
- In alkalosis, the pH increases and excess bicarbonate ions move into the tubules, combine with **sodium**, and are excreted in the urine.
- Selective regulation of bicarbonate occurs in the kidneys.
 - The kidneys restore bicarbonate by excreting hydrogen ions and retaining bicarbonate ions.
 - Excess hydrogen ions are excreted in the urine in the form of phosphoric acid.
 - The alteration of certain amino acids in the renal tubules results in a diffusion of ammonia into the kidneys; the ammonia combines with excess hydrogen ions and is excreted in the urine.

E. Potassium (K^+)

- Potassium plays an exchange role in maintaining acid-base balance.
- The body changes the potassium level by drawing hydrogen ions into the cells or by pushing them out of the cells (potassium movement across cell membranes is facilitated by transcellular shifting in response to acid-base patterns).
- The potassium level changes to compensate for hydrogen ion level changes (Fig. 9-2).
 - In acidosis, the body protects itself from the acidic state by moving hydrogen ions into the cells. Therefore, potassium moves out to make room for hydrogen ions and the potassium level increases.
 - In alkalosis, the cells release hydrogen ions into the blood in an attempt to increase the acidity of the blood; this forces the potassium into the cells and potassium levels decrease.

! When the client experiences an acid-base imbalance, monitor the potassium level closely because the potassium moves in or out of the cells in an attempt to maintain acid-base balance. The resulting hypokalemia or hyperkalemia predisposes the client to associated complications.

FIGURE 9-2 Movement of potassium in response to changes in the extracellular fluid hydrogen ion concentration.

III. Respiratory Acidosis

A. Description: The total concentration of buffer base is lower than normal, with a relative increase in hydrogen ion concentration; thus a greater number of hydrogen ions is circulating in the blood than can be absorbed by the buffer system.

B. Causes (Box 9-1)

1. Respiratory acidosis is caused by primary defects in the function of the lungs or changes in normal respiratory patterns.
2. Any condition that causes an obstruction of the airway or depresses the respiratory system can cause respiratory acidosis.

! If the client has a condition that causes an obstruction of the airway or depresses the respiratory system, monitor the client for respiratory acidosis.

C. Assessment: In an attempt to compensate, the kidneys retain bicarbonate and excrete excess hydrogen ions into the urine (Table 9-1).

D. Interventions

1. Monitor for signs of respiratory distress.
2. Administer O₂ as prescribed.
3. Place the client in a semi-Fowler's position.
4. Encourage and assist the client to turn, cough, and deep-breathe.
5. Encourage hydration to thin secretions.

BOX 9-1 Causes of Respiratory Acidosis

- Asthma: Spasms resulting from allergens, irritants, or emotions cause the smooth muscles of the bronchioles to constrict, resulting in ineffective gas exchange.
- Atelectasis: Excessive mucus collection, with the collapse of alveolar sacs caused by mucous plugs, infectious drainage, or anesthetic medications, results in ineffective gas exchange.
- Brain trauma: Excessive pressure on the respiratory center or medulla oblongata depresses respirations.
- Bronchiectasis: Bronchi become dilated as a result of inflammation, and destructive changes and weakness in the walls of the bronchi occur.
- Bronchitis: Inflammation causes airway obstruction, resulting in inadequate gas exchange.
- Central nervous system depressants: Depressants such as sedatives, opioids, and anesthetics depress the respiratory center, leading to hypoventilation (excessive sedation from medications may require reversal by opioid antagonist medications); carbon dioxide (CO₂) is retained and the hydrogen ion concentration increases.
- Emphysema and COPD: Loss of elasticity of alveolar sacs restricts air flow in and out, primarily out, leading to an increased CO₂ level.
- Administering high oxygen levels per nasal cannula to clients who are CO₂ retainers (i.e., emphysema and COPD).
- Hypoventilation: Carbon dioxide is retained and the hydrogen ion concentration increases, leading to the acidotic state; carbonic acid is retained and the pH decreases.
- Pneumonia: Excess mucus production and lung congestion cause airway obstruction, resulting in inadequate gas exchange.
- Pulmonary edema: Extracellular accumulation of fluid in pulmonary tissue causes disturbances in alveolar diffusion and perfusion.
- Pulmonary emboli: Emboli cause obstruction in a pulmonary artery resulting in airway obstruction and inadequate gas exchange.

TABLE 9-1 Clinical Manifestations of Acidosis

Respiratory (" PaCO ₂)	Metabolic (#HCO ₃ ²⁻)
Neurological	
Drowsiness	Drowsiness
Disorientation	Confusion
Dizziness	Headache
Headache	Coma
Coma	
Cardiovascular	
Decreased blood pressure	Decreased blood pressure
Dysrhythmias (related to hyperkalemia from compensation)	Dysrhythmias (related to hyperkalemia from compensation)
Warm, flushed skin (related to peripheral vasodilation)	Warm, flushed skin (related to peripheral vasodilation)
Gastrointestinal	
No significant findings	Nausea, vomiting, diarrhea, abdominal pain
Neuromuscular	
Seizures	No significant findings
Respiratory	
Hypoventilation with hypoxia (lungs are unable to compensate when there is a respiratory problem)	Deep, rapid respirations (compensatory action by the lungs); known as Kussmaul's respirations

From Lewis S, Dirksen S, Heitkemper M, Bucher L, Camera I: Medical-surgical nursing: assessment and management of clinical problems, ed 9, St. Louis, 2014, Mosby.

6. Reduce restlessness by improving ventilation rather than by administering tranquilizers, sedatives, or opioids because these medications further depress respirations.
7. Prepare to administer respiratory treatments as prescribed.
8. Suction the client's airway, if necessary.
9. Monitor electrolyte values, particularly the potassium level and arterial blood gas (ABG) levels.
10. Administer antibiotics for respiratory infection or other medications as prescribed.

11. Prepare for endotracheal intubation and mechanical ventilation if CO₂ levels rise above 50 mm Hg and if signs of acute respiratory distress are present.

 Clients with a history of emphysema or chronic obstructive pulmonary disease (COPD) usually are not given oxygen greater than 2 liters by cannula since high levels of oxygen in the blood may decrease the stimulus to breathe leading to CO₂ retention and respiratory acidosis.

IV. Respiratory Alkalosis

- A. Description: A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids.
- B. Causes: Respiratory alkalosis results from conditions that cause overstimulation of the respiratory system (Box 9-2).

 If the client has a condition that causes overstimulation of the respiratory system, monitor the client for respiratory alkalosis.

- C. Assessment: Initially the hyperventilation and respiratory stimulation cause abnormal rapid respirations (tachypnea); in an attempt to compensate, the kidneys excrete excess circulating bicarbonate into the urine (Table 9-2).
- D. Interventions
 1. Monitor for signs of respiratory distress.
 2. Provide emotional support and reassurance to the client.
 3. Encourage appropriate breathing patterns.
 4. Assist with breathing techniques and breathing aids as prescribed.
 - a. Encourage voluntary holding of the breath if appropriate.
 - b. Provide use of a rebreathing mask as prescribed.
 - c. Provide CO₂ breaths as prescribed (rebreathing into a paper bag).
 5. Provide cautious care with ventilator clients so that they are not forced to take breaths too deeply or rapidly.
 6. Monitor electrolyte values, particularly potassium and calcium levels; monitor ABG levels.

BOX 9-2 Causes of Respiratory Alkalosis

- Fever: Causes increased metabolism, resulting in overstimulation of the respiratory system.
- Hyperventilation: Rapid respirations cause the blowing off of carbon dioxide (CO₂), leading to a decrease in carbonic acid.
- Hypoxia: Stimulates the respiratory center in the brainstem, which causes an increase in the respiratory rate in order to increase oxygen (O₂); this causes hyperventilation, which results in a decrease in the CO₂ level.
- Hysteria: Often is neurogenic and related to a psychoneurosis; however, this condition leads to vigorous breathing and excessive exhaling of CO₂.
- Overventilation by mechanical ventilators: The administration of O₂ and the depletion of CO₂ can occur from mechanical ventilation, causing the client to be hyperventilated.
- Pain: Overstimulation of the respiratory center in the brainstem results in a carbonic acid deficit.

TABLE 9-2 Clinical Manifestations of Alkalosis

Respiratory (#Paco ₂)	Metabolic (" HCO ₃ ²⁻)
Neurological	
Lethargy	Drowsiness
Lightheadedness	Dizziness
Confusion	Nervousness
	Confusion
Cardiovascular	
Tachycardia	Tachycardia
Dysrhythmias (related to hypokalemia from compensation)	Dysrhythmias (related to hypokalemia from compensation)
Gastrointestinal	
Nausea	Anorexia
Vomiting	Nausea
Epigastric pain	Vomiting
Neuromuscular	
Tetany	Tremors
Numbness	Hypertonic muscles
Tingling of extremities	Muscle cramps
Hyperreflexia	Tetany
Seizures	Tingling of extremities
	Seizures
Respiratory	
Hyperventilation (lungs are unable to compensate when there is a respiratory problem)	Hypoventilation (compensatory action by the lungs)

From Lewis S, Dirksen S, Heitkemper M, Bucher L, Camera I: Medical-surgical nursing: assessment and management of clinical problems, ed 9, St. Louis, 2014, Mosby.

7. Prepare to administer calcium gluconate for tetany as prescribed.

V. Metabolic Acidosis

A. Description: A total concentration of buffer base that is lower than normal, with a relative increase in the hydrogen ion concentration, resulting from loss of too much base and/or retention of too much acid.

B. Causes (Box 9-3)

 An insufficient supply of insulin in a client with diabetes mellitus can result in metabolic acidosis known as diabetic ketoacidosis.

C. Assessment: To compensate for the acidosis, deep and rapid respirations, known as Kussmaul's respirations, occur as the lungs attempt to exhale the excess CO₂ (see Table 9-1).

D. Interventions

1. Monitor for signs of respiratory distress.
2. Assess level of consciousness for central nervous system depression.

BOX 9-3 Causes of Metabolic Acidosis

- Diabetes mellitus or diabetic ketoacidosis: An insufficient supply of insulin causes increased fat metabolism, leading to an excess accumulation of ketones or other acids; the bicarbonate then ends up being depleted.
- Excessive ingestion of acetylsalicylic acid: Causes an increase in the hydrogen ion concentration.
- High-fat diet: Causes a much too rapid accumulation of the waste products of fat metabolism, leading to a buildup of ketones and acids.
- Insufficient metabolism of carbohydrates: When the oxygen supply is not sufficient for the metabolism of carbohydrates, lactic acid is produced and lactic acidosis results.
- Malnutrition: Improper metabolism of nutrients causes fat catabolism, leading to an excess buildup of ketones and acids.
- Renal insufficiency, acute kidney injury, or chronic kidney disease: Increased waste products of protein metabolism are retained; acids increase, and bicarbonate is unable to maintain acid-base balance.
- Severe diarrhea: Intestinal and pancreatic secretions are normally alkaline; therefore, excessive loss of base leads to acidosis.

3. Monitor intake and output and assist with fluid and electrolyte replacement as prescribed.
4. Prepare to administer solutions intravenously as prescribed to increase the buffer base.
5. Initiate safety and seizure precautions.
6. Monitor the ABG levels and the potassium level closely; as metabolic acidosis resolves, potassium moves back into the cells and the potassium level decreases.

E. Interventions in diabetes mellitus and diabetic ketoacidosis

1. Give insulin as prescribed to hasten the movement of glucose into the cells, thereby decreasing the concurrent ketosis.
2. When glucose is being properly metabolized, the body will stop converting fats to glucose.
3. Monitor for circulatory collapse caused by polyuria, which may result from the hyperglycemic state; osmotic diuresis may lead to extracellular volume deficit.

 Monitor the client experiencing severe diarrhea for manifestations of metabolic acidosis.

F. Interventions in kidney disease

1. Dialysis may be used to remove protein and waste products, thereby lessening the acidotic state.
2. A diet low in protein and high in calories decreases the amount of protein waste products, which in turn lessens the acidosis.

VI. Metabolic Alkalosis

A. Description: A deficit of carbonic acid and a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid

without a comparable loss of base in the body fluids.

B. Causes: Metabolic alkalosis results from a dysfunction of **metabolism** that causes an increased amount of available base solution in the **blood** or a decrease in available acids in the blood (Box 9-4).

C. Assessment: To compensate, respiratory rate and depth decrease to conserve CO₂ (see Table 9-2).

 **Monitor the client experiencing excessive vomiting or the client with gastrointestinal suctioning for manifestations of metabolic alkalosis.**

D. Interventions

1. Monitor for signs of respiratory distress.
2. Monitor ABGs and **potassium** and **calcium** levels.
3. Institute safety precautions.
4. Prepare to administer medications and intravenous fluids as prescribed to promote the kidney excretion of bicarbonate.
5. Prepare to replace potassium as prescribed.
6. Treat the underlying cause of the alkalosis.

VII. Arterial Blood Gases (ABGs) (Table 9-3)

A. Collection of an ABG specimen

1. Obtain vital signs.
2. Determine whether the client has an arterial line in place (allows for arterial blood sampling without further puncture to the client).

BOX 9-4 Causes of Metabolic Alkalosis

- Diuretics: The loss of hydrogen ions and chloride from diuresis causes a compensatory increase in the amount of bicarbonate in the blood.
- Excessive vomiting or gastrointestinal suctioning: Leads to an excessive loss of hydrochloric acid.
- Hyperaldosteronism: Increased renal tubular reabsorption of sodium occurs, with the resultant loss of hydrogen ions.
- Ingestion of and/or infusion of excess sodium bicarbonate: Causes an increase in the amount of base in the blood.
- Massive transfusion of whole blood: The citrate anticoagulant used for the storage of blood is metabolized to bicarbonate.

TABLE 9-3 Normal Arterial Blood Gas Values

Laboratory Test	Normal Range	
	Conventional Units	SI Units
pH	7.35-7.45	7.35-7.45
Paco ₂	35-45 mm Hg	35-45 mm Hg
Bicarbonate (HCO ₃ ^A)	21-28 mEq/L	21-28 mmol/L
Pao ₂	80-100 mm Hg	80-100 mm Hg

kPa, Kilopascal; mmol, millimole (10^{A3} mole); Paco₂, partial pressure of carbon dioxide in arterial blood; Pao₂, partial pressure of oxygen in arterial blood.

Note: Because arterial blood gases are influenced by altitude, the value for Pao₂ decreases as altitude increases.

3. Perform the **Allen's test** to determine the presence of collateral circulation (see **Priority Nursing Actions**).

PRIORITY NURSING ACTIONS

Performing the Allen's Test Before Radial Artery Puncture

1. Explain the procedure to the client.
2. Apply pressure over the ulnar and radial arteries simultaneously.
3. Ask the client to open and close the hand repeatedly.
4. Release pressure from the ulnar artery while compressing the radial artery.
5. Assess the color of the extremity distal to the pressure point.
6. Document the findings.

The Allen's test is performed before obtaining an arterial blood specimen from the radial artery to determine the presence of collateral circulation and the adequacy of the ulnar artery. Failure to determine the presence of adequate collateral circulation could result in severe ischemic injury to the hand if damage to the radial artery occurs with arterial puncture. The nurse first would explain the procedure to the client. To perform the test, the nurse applies direct pressure over the client's ulnar and radial arteries simultaneously. While applying pressure, the nurse asks the client to open and close the hand repeatedly; the hand should blanch. The nurse then releases pressure from the ulnar artery while compressing the radial artery and assesses the color of the extremity distal to the pressure point. If pinkness fails to return within 6 to 7 seconds, the ulnar artery is insufficient, indicating that the radial artery should not be used for obtaining a blood specimen. Finally, the nurse documents the findings. Other sites, such as the brachial or femoral artery, can be used if the radial artery is not deemed adequate.

Reference

Perry, Potter, Ostendorf (2014), pp. 1091-1092.

4. Assess factors that may affect the accuracy of the results, such as changes in the O₂ settings, suctioning within the past 20 minutes, and client's activities.
5. Provide emotional support to the client.
6. Assist with the specimen draw; prepare a heparinized syringe (if not already prepackaged).
7. Apply pressure immediately to the puncture site following the blood draw; maintain pressure for 5 minutes or for 10 minutes if the client is taking an anticoagulant.
8. Appropriately label the specimen and transport it on ice to the laboratory.
9. On the laboratory form, record the client's temperature and the type of supplemental O₂ that the client is receiving.

TABLE 9-4 Acid-Base Imbalances: Usual Laboratory Value Changes

Imbalance	pH	HCO ₃ ^A	PaO ₂	Paco ₂	K ⁺
Respiratory acidosis	U: Decreased PC: Decreased C: Normal	U: Normal PC: Increased C: Increased	Usually decreased	U: Increased PC: Increased C: Increased	Increased
Respiratory alkalosis	U: Increased PC: Increased C: Normal	U: Normal PC: Decreased C: Decreased	Usually normal but depends on other accompanying conditions	U: Decreased PC: Decreased C: Decreased	Decreased
Metabolic acidosis	U: Decreased PC: Decreased C: Normal	U: Decreased PC: Decreased C: Decreased	Usually normal but depends on other accompanying conditions	U: Normal PC: Decreased C: Decreased	Increased
Metabolic alkalosis	U: Increased PC: Increased C: Normal	U: Increased PC: Increased C: Increased	Usually normal but depends on other accompanying conditions	U: Normal PC: Increased C: Increased	Decreased

U, uncompensated; PC, partially compensated; C, compensated.

B. Respiratory acid-base imbalances (Table 9-4)

1. Remember that the respiratory function indicator is the Paco₂.
2. In a respiratory imbalance, you will find an opposite relationship between the pH and the Paco₂; in other words, the pH will be elevated with a decreased Paco₂ (alkalosis) or the pH will be decreased with an elevated Paco₂ (acidosis).
3. Look at the pH and the Paco₂ to determine whether the condition is a respiratory problem.
4. **Respiratory acidosis:** The pH is decreased; the Paco₂ is elevated.
5. **Respiratory alkalosis:** The pH is elevated; the Paco₂ is decreased.

C. Metabolic acid-base imbalances (see Table 9-4)

1. Remember, the metabolic function indicator is the bicarbonate ion (HCO₃^A).
2. In a metabolic imbalance, there is a corresponding relationship between the pH and the HCO₃^A; in other words, the pH will be elevated and HCO₃^A will be elevated (alkalosis), or the pH will be decreased and HCO₃^A will be decreased (acidosis).
3. Look at the pH and the HCO₃^A to determine whether the condition is a metabolic problem.
4. **Metabolic acidosis:** The pH is decreased; the HCO₃^A is decreased.
5. **Metabolic alkalosis:** The pH is elevated; the HCO₃^A is elevated.

! In a respiratory imbalance, the ABG result indicates an opposite relationship between the pH and the Paco₂. In a metabolic imbalance, the ABG result indicates a corresponding relationship between the pH and the HCO₃^A.

D. Compensation (see Table 9-4)

1. Compensation refers to the body processes that occur to counterbalance the acid-base disturbance.
2. When full compensation has occurred, the pH is within normal limits.

E. Steps for analyzing ABG results (Box 9-5)

F. Mixed acid-base disorders

1. Occurs when 2 or more disorders are present at the same time.
2. The pH will depend on the type and severity of the disorders involved, including any compensatory mechanisms at work, e.g., respiratory acidosis combined with metabolic acidosis will result in a greater decrease in pH than either imbalance occurring alone.
3. Example: Mixed alkalosis can occur if a client begins to hyperventilate due to postoperative pain (respiratory alkalosis) and is also losing acid due to gastric suctioning (metabolic alkalosis).

CRITICAL THINKING What Should You Do?

Answer: Failure to determine the presence of adequate collateral circulation before drawing an arterial blood gas specimen could result in severe ischemic injury to the hand if damage to the radial artery occurs with arterial puncture. Upon release of pressure on the ulnar artery, if pinkness fails to return within 6 to 7 seconds, the ulnar artery is insufficient, indicating that the radial artery should not be used for obtaining a blood specimen. Another site needs to be selected for the arterial puncture and the health care provider needs to be notified of the finding.

Reference: Perry, Potter, Ostendorf (2014), p. 1091.

BOX 9-5 Analyzing Arterial Blood Gas Results

If you can remember the following Pyramid Points and Pyramid Steps, you will be able to analyze any blood gas report.

Pyramid Points

In acidosis, the pH is decreased.

In alkalosis, the pH is elevated.

The respiratory function indicator is the PaCO_2 .

The metabolic function indicator is the bicarbonate ion (HCO_3^{A}).

Pyramid Steps**Pyramid Step 1**

Look at the blood gas report. Look at the pH. Is the pH elevated or decreased? If the pH is elevated, it reflects alkalosis. If the pH is decreased, it reflects acidosis.

Pyramid Step 2

Look at the PaCO_2 . Is the PaCO_2 elevated or decreased? If the PaCO_2 reflects an opposite relationship to the pH, the condition

is a respiratory imbalance. If the PaCO_2 does not reflect an opposite relationship to the pH, go to Pyramid Step 3.

Pyramid Step 3

Look at the HCO_3^{A} . Does the HCO_3^{A} reflect a corresponding relationship with the pH? If it does, the condition is a metabolic imbalance.

Pyramid Step 4

Full compensation has occurred if the pH is in a normal range of 7.35 to 7.45. If the pH is not within normal range, look at the respiratory or metabolic function indicators.

If the condition is a respiratory imbalance, look at the HCO_3^{A} to determine the state of compensation.

If the condition is a metabolic imbalance, look at the PaCO_2 to determine the state of compensation.

PRACTICE QUESTIONS

53. The nurse reviews the arterial blood gas results of a client and notes the following: pH 7.45, PaCO_2 of 30 mm Hg (30 mm Hg), and HCO_3^{A} of 20 mEq/L (20 mmol/L). The nurse analyzes these results as indicating which condition?
1. Metabolic acidosis, compensated
 2. Respiratory alkalosis, compensated
 3. Metabolic alkalosis, uncompensated
 4. Respiratory acidosis, uncompensated
54. The nurse is caring for a client with a nasogastric tube that is attached to low suction. The nurse monitors the client for manifestations of which disorder that the client is at risk for?
1. Metabolic acidosis
 2. Metabolic alkalosis
 3. Respiratory acidosis
 4. Respiratory alkalosis
55. A client with a 3-day history of nausea and vomiting presents to the emergency department. The client is hypoventilating and has a respiratory rate of 10 breaths/minute. The electrocardiogram (ECG) monitor displays tachycardia, with a heart rate of 120 beats/minute. Arterial blood gases are drawn and the nurse reviews the results, expecting to note which finding?
1. A decreased pH and an increased PaCO_2
 2. An increased pH and a decreased PaCO_2
 3. A decreased pH and a decreased HCO_3^{A}
 4. An increased pH and an increased HCO_3^{A}
56. The nurse is caring for a client having respiratory distress related to an anxiety attack. Recent arterial blood gas values are pH $\frac{1}{4}$ 7.53, PaO_2 $\frac{1}{4}$ 72 mm Hg (72 mm Hg), PaCO_2 $\frac{1}{4}$ 32 mm Hg (32 mm Hg), and HCO_3^{A} $\frac{1}{4}$ 28 mEq/L (28 mmol/L). Which conclusion about the client should the nurse make?
1. The client has acidotic blood.
 2. The client is probably overreacting.
 3. The client is fluid volume overloaded.
 4. The client is probably hyperventilating.
57. The nurse is caring for a client with diabetic ketoacidosis and documents that the client is experiencing Kussmaul's respirations. Which patterns did the nurse observe? Select all that apply.
- 1. Respirations that are shallow
 - 2. Respirations that are increased in rate
 - 3. Respirations that are abnormally slow
 - 4. Respirations that are abnormally deep
 - 5. Respirations that cease for several seconds
58. A client who is found unresponsive has arterial blood gases drawn and the results indicate the following: pH is 7.12, PaCO_2 is 90 mm Hg (90 mm Hg), and HCO_3^{A} is 22 mEq/L (22 mmol/L). The nurse interprets the results as indicating which condition?
1. Metabolic acidosis with compensation
 2. Respiratory acidosis with compensation
 3. Metabolic acidosis without compensation
 4. Respiratory acidosis without compensation

- ❖ 59. The nurse notes that a client's arterial blood gas (ABG) results reveal a pH of 7.50 and a P_{aCO_2} of 30 mm Hg (30 mm Hg). The nurse monitors the client for which clinical manifestations associated with these ABG results? Select all that apply.
- 1. Nausea
 - 2. Confusion
 - 3. Bradypnea
 - 4. Tachycardia
 - 5. Hyperkalemia
 - 6. Lightheadedness
60. The nurse reviews the blood gas results of a client with atelectasis. The nurse analyzes the results and determines that the client is experiencing respiratory acidosis. Which result validates the nurse's findings?
- 1. pH 7.25, P_{aCO_2} 50 mm Hg (50 mm Hg)
 - 2. pH 7.35, P_{aCO_2} 40 mm Hg (40 mm Hg)
 - 3. pH 7.50, P_{aCO_2} 52 mm Hg (52 mm Hg)
 - 4. pH 7.52, P_{aCO_2} 28 mm Hg (28 mm Hg)
61. The nurse is caring for a client who is on a mechanical ventilator. Blood gas results indicate a pH of 7.50 and a P_{aCO_2} of 30 mm Hg (30 mm Hg). The nurse has determined that the client is experiencing respiratory alkalosis. Which laboratory value would most likely be noted in this condition?
- 1. Sodium level of 145 mEq/L (145 mmol/L)
 - 2. Potassium level of 3.0 mEq/L (3.0 mmol/L)
 - 3. Magnesium level of 1.3 mEq/L (0.65 mmol/L)
 - 4. Phosphorus level of 3.0 mg/dL (0.97 mmol/L)
62. The nurse is caring for a client with several broken ribs. The client is most likely to experience what type of acid-base imbalance?
- 1. Respiratory acidosis from inadequate ventilation
 - 2. Respiratory alkalosis from anxiety and hyperventilation
 - 3. Metabolic acidosis from calcium loss due to broken bones
 - 4. Metabolic alkalosis from taking analgesics containing base products

ANSWERS

53. 2

Rationale: The normal pH is 7.35 to 7.45. In a respiratory condition, an opposite effect will be seen between the pH and the P_{aCO_2} . In this situation, the pH is at the high end of the normal value and the P_{aCO_2} is low. In an alkalotic condition, the pH is elevated. Therefore, the values identified in the question indicate a respiratory alkalosis that is compensated by the kidneys through the renal excretion of bicarbonate. Because the pH has returned to a normal value, compensation has occurred.

Test-Taking Strategy: Focus on the **subject**, arterial blood gas results. Remember that in a respiratory imbalance you will find an opposite response between the pH and the P_{aCO_2} as indicated in the question. Therefore, you can eliminate the options reflective of a primary metabolic problem. Also, remember that the pH increases in an alkalotic condition and compensation can be evidenced by a normal pH. The correct option reflects a respiratory alkalotic condition and compensation and describes the blood gas values as indicated in the question.

Review: The steps related to **analyzing arterial blood gas results** and the findings noted in **respiratory alkalosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Lewis et al. (2014), p. 304.

54. 2

Rationale: Metabolic alkalosis is defined as a deficit or loss of hydrogen ions or acids or an excess of base (bicarbonate) that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions resulting in hypovolemia, the loss of gastric fluid, excessive bicarbonate intake, the massive transfusion

of whole blood, and hyperaldosteronism. Loss of gastric fluid via nasogastric suction or vomiting causes metabolic alkalosis as a result of the loss of hydrochloric acid. The remaining options are incorrect interpretations.

Test-Taking Strategy: Focus on the **subject**, a client with a nasogastric tube attached to suction. Remembering that a client receiving nasogastric suction loses hydrochloric acid will direct you to the option identifying an alkalotic condition. Because the question addresses a situation other than a respiratory one, the acid-base disorder would be a metabolic condition.

Review: The **causes of metabolic alkalosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Lewis et al. (2014), pp. 304–305.

55. 4

Rationale: Clients experiencing nausea and vomiting would most likely present with metabolic alkalosis resulting from loss of gastric acid, thus causing the pH and HCO_3^- to increase. Symptoms experienced by the client would include hypoventilation and tachycardia. Option 1 reflects a respiratory acidotic condition. Option 2 reflects a respiratory alkalotic condition, and option 3 reflects a metabolic acidotic condition.

Test-Taking Strategy: Focus on the **subject**, expected arterial blood gas findings. Note the data in the question and that the client is vomiting. Recalling that vomiting most likely causes metabolic alkalosis will assist in directing you to the correct option.

Review: The **causes of metabolic alkalosis**

Level of Cognitive Ability: Synthesizing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

References: Ignatavicius, Workman (2016), pp. 183–184; Lewis et al. (2014), pp. 303–305.

56. 4

Rationale: The ABG values are abnormal, which supports a physiological problem. The ABGs indicate respiratory alkalosis as a result of hyperventilating, not acidosis. Concluding that the client is overreacting is an insufficient analysis. No conclusion can be made about a client's fluid volume status from the information provided.

Test-Taking Strategy: Focus on the **data in the question**. Note the ABG values and use knowledge to interpret them. Note that the pH is elevated and the P_{aCO_2} is decreased from normal. This will assist you in determining that the client is experiencing respiratory alkalosis. Next, think about the causes of respiratory alkalosis to answer correctly.

Review: The **causes of respiratory alkalosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Analysis

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Lewis et al. (2014), pp. 304–305.

❖ 57. 2, 4

Rationale: Kussmaul's respirations are abnormally deep and increased in rate. These occur as a result of the compensatory action by the lungs. In bradypnea, respirations are regular but abnormally slow. Apnea is described as respirations that cease for several seconds.

Test-Taking Strategy: Focus on the **subject**, the characteristics of Kussmaul's respirations. Use knowledge of the description of Kussmaul's respirations. Recalling that this type of respiration occurs in diabetic ketoacidosis will assist you in answering correctly.

Review: The characteristics of **Kussmaul's respirations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Perry, Potter, Ostendorf (2014), p. 89.

58. 4

Rationale: The acid-base disturbance is respiratory acidosis without compensation. The normal pH is 7.35 to 7.45. The normal P_{aCO_2} is 35 to 45 mm Hg (35 to 45 mm Hg). In respiratory acidosis the pH is decreased and the P_{aCO_2} is elevated. The normal bicarbonate (HCO_3^-) level is 21 to 28 mEq/L (21 to 28 mmol/L). Because the bicarbonate is still within normal limits, the kidneys have not had time to adjust for this acid-base disturbance. In addition, the pH is not within normal limits. Therefore, the condition is without compensation. The remaining options are incorrect interpretations.

Test-Taking Strategy: Focus on the **subject**, interpretation of arterial blood gas results. Remember that in a respiratory imbalance you will find an opposite response between the pH and the P_{aCO_2} . Also, remember that the pH is decreased

in an acidotic condition and that compensation is reflected by a normal pH.

❖ 59. 1, 2, 4, 6

Rationale: Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Clinical manifestations of respiratory alkalosis include lethargy, lightheadedness, confusion, tachycardia, dysrhythmias related to hypokalemia, nausea, vomiting, epigastric pain, and numbness and tingling of the extremities. Hyperventilation (tachypnea) occurs. Bradypnea describes respirations that are regular but abnormally slow. Hyperkalemia is associated with acidosis.

Test-Taking Strategy: Focus on the **subject**, the interpretation of ABG values. Note the data in the question to determine that the client is experiencing respiratory alkalosis. Next, it is necessary to think about the pathophysiology that occurs in this condition and recall the manifestations that occur.

Review: The clinical manifestations of **respiratory alkalosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Lewis et al. (2014), p. 305.

60. 1

Rationale: Atelectasis is a condition characterized by the collapse of alveoli, preventing the respiratory exchange of oxygen and carbon dioxide in a part of the lungs. The normal pH is 7.35 to 7.45. The normal P_{aCO_2} is 35 to 45 mm Hg (35 to 45 mm Hg). In respiratory acidosis, the pH is decreased and the P_{aCO_2} is elevated. Option 2 identifies normal values. Option 3 identifies an alkalotic condition, and option 4 identifies respiratory alkalosis.

Test-Taking Strategy: Focus on the **subject**, the arterial blood gas results in a client with atelectasis. Remember that in a respiratory imbalance you will find an opposite response between the pH and the P_{aCO_2} . Also, remember that the pH is decreased in an acidotic condition. First eliminate option 2 because it reflects a normal blood gas result. Options 3 and 4 identify an elevated pH, indicating an alkalotic condition. The correct option is the only one that reflects an acidotic condition.

Review: Blood gas findings in **respiratory acidosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Lewis et al. (2014), pp. 305, 550.

61. 2

Rationale: Respiratory alkalosis is defined as a deficit of carbonic acid or a decrease in hydrogen ion concentration that results from the accumulation of base or from a loss of acid without a comparable loss of base in the body fluids. This occurs in conditions that cause overstimulation of the respiratory system. Clinical manifestations of respiratory alkalosis include lethargy, lightheadedness, confusion, tachycardia, dysrhythmias related to hypokalemia, nausea, vomiting, epigastric pain, and numbness and tingling of the extremities. All three incorrect options identify normal laboratory values. The correct option identifies the presence of hypokalemia.

Test-Taking Strategy: Note the **strategic words**, most likely. Focus on the **data in the question** and use knowledge about the interpretation of arterial blood gas values to determine that the client is experiencing respiratory alkalosis. Next, recall the manifestations that occur in this condition and the normal laboratory values. The only abnormal laboratory value is the potassium level, the correct option.

Review: The clinical manifestations of **respiratory alkalosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Acid-Base

Priority Concepts: Acid-Base Balance; Clinical Judgment

Reference: Lewis et al. (2014), p. 305.

62. 1

Rationale: Respiratory acidosis is most often caused by hypoventilation. The client with broken ribs will have difficulty with breathing adequately and is at risk for hypoventilation and resultant respiratory acidosis. The remaining options are incorrect. Respiratory alkalosis is associated with hyperventilation. There are no data in the question that indicate calcium loss or that the client is taking analgesics containing base products. Test-Taking Strategy: Focus on the **data in the question**. Think about the location of the ribs to determine that the client will have difficulty breathing adequately. This will assist in directing you to the correct option. Remembering that hypoventilation results in respiratory acidosis will direct you to the correct option.

Vital Signs and Laboratory Reference Intervals

PRIORITY CONCEPTS Cellular Regulation; Perfusion

CRITICAL THINKING What Should You Do?

The nurse has just received a client from the postanesthesia care unit (PACU) and is monitoring the client's vital signs. On arrival to the unit, the client's temperature was 37.2 °C (98.9 °F) orally, the blood pressure was 142/78 mm Hg, the heart rate was 98 beats per minute, the respiratory rate was 14 breaths per minute, and the oxygen saturation was 95% on 3 L of oxygen via nasal cannula. The nurse returns to the room 30 minutes later to find the client's temperature to be 36.8 °C (98.2 °F) orally, the blood pressure 95/54 mm Hg, the heart rate 118 beats per minute, the respiratory rate 18 breaths per minute, and the oxygen saturation 92% on 3 L of oxygen via nasal cannula. On the basis of these data, what actions should the nurse take?

Answer located on p. 119.

I. Vital Signs

- A. Description: Vital signs include temperature, pulse, respirations, blood pressure (BP), oxygen saturation (pulse oximetry), and pain assessment.
- B. Guidelines for measuring vital signs
 1. Initial measurement of vital signs provides baseline data on a client's health status and is used to help identify changes in the client's health status.
 2. Some vital sign measurements (temperature, pulse, respirations, BP, pulse oximetry) may be delegated to unlicensed assistive personnel (UAP), but the nurse is responsible for interpreting the findings.
 3. The nurse collaborates with the health care provider (HCP) in determining the frequency of vital sign assessment and also makes independent decisions regarding their frequency on the basis of the client's status.

 The nurse always documents vital sign measurements and reports abnormal findings to the HCP.

- C. When vital signs are measured
 1. On initial contact with a client (e.g., when a client is admitted to a health care facility)
 2. During physical assessment of a client
 3. Before and after an invasive diagnostic procedure or surgical procedure
 4. During the administration of medication that affects the cardiac, respiratory, or temperature-controlling functions (e.g., in a client who has a fever); may be required before, during, and after administration of the medication
 5. Before, during, and after a blood transfusion
 6. Whenever a client's condition changes
 7. Whenever an intervention (e.g., ambulation) may affect a client's condition
 8. When a fever or known infection is present (every 2 to 4 hours)

II. Temperature

A. Description

1. Normal body temperature ranges from 36.4° to 37.5° Celsius (C) (97.5° to 99.5° Fahrenheit [F]); the average in a healthy young adult is 37.0 °C (98.6 °F).
2. Common measurement sites are the mouth, rectum, axilla, ear, and across the forehead (temporal artery site); various types of electronic measuring devices are commonly used.
3. Rectal temperatures are usually 1 °F (0.5 °C) higher and axillary temperatures about 1 °F (0.5 °C) lower than the normal oral temperature.
4. Know how to convert a temperature to a Fahrenheit or Celsius value ([Box 10-1](#)).

B. Nursing considerations

1. Time of day
 - a. Temperature is generally in the low-normal range at the time of awakening as a result of muscle inactivity.
 - b. Afternoon body temperature may be high-normal as a result of the metabolic process, activity, and environmental temperature.

BOX 10-1 Body Temperature Conversion

To convert Fahrenheit to Celsius: Degrees Fahrenheit – 32 \hat{A} 5/9 $\frac{1}{4}$ Degrees Celsius

Example: 98.2 °F – 32 \hat{A} 5/9 $\frac{1}{4}$ 36.7 °C

To convert Celsius to Fahrenheit: Degrees Celsius \hat{A} 9/5 + 32 $\frac{1}{4}$ Degrees Fahrenheit

Example: 38.6 °C \hat{A} 9/5 + 32 $\frac{1}{4}$ 101.5 °F

2. Environmental temperature: Body temperature is lower in cold weather and higher in warm weather.
 3. Age: Temperature may fluctuate during the first year of life because the infant's heat-regulating mechanism is not fully developed.
 4. Physical exercise: Use of the large muscles creates heat, causing an increase in body temperature.
 5. Menstrual cycle: Temperature decreases slightly just before ovulation but may increase to 1 °F above normal during ovulation.
 6. Pregnancy: Body temperature may consistently stay at high-normal because of an increase in the woman's metabolic rate.
 7. Stress: Emotions increase hormonal secretion, leading to increased heat production and a higher temperature.
 8. Illness: Infective agents and the inflammatory response may cause an increase in temperature.
 9. The inability to obtain a temperature should not be ignored because it could represent a condition of hypothermia, a life-threatening condition in very young and older clients.
- C. Methods of measurement
1. Oral
 - a. If the client has recently consumed hot or cold foods or liquids or has smoked or chewed gum, the nurse must wait 15 to 30 minutes before taking the temperature orally.
 - b. The thermometer is placed under the tongue in 1 of the posterior sublingual pockets; ask the client to keep the tongue down and the lips closed and to not bite down on the thermometer.
 2. Rectal
 - a. Place the client in the Sims position.
 - b. The temperature is taken rectally when an accurate temperature cannot be obtained orally or when the client has nasal congestion, has undergone nasal or oral surgery or had the jaws wired, has a nasogastric tube in place, is unable to keep the mouth closed, or is at risk for seizures.
 - c. The thermometer is lubricated and inserted into the rectum, toward the umbilicus, about 1.5 inches (3.8 cm) (no more than 0.5 inch [1.25 cm] in an infant).

 The temperature is not taken rectally in cardiac clients; the client who has undergone rectal surgery; or the client with diarrhea, fecal impaction, or rectal bleeding or who is at risk for bleeding.

3. Axillary
 - a. This method of taking the temperature is used when the oral or rectal temperature measurement is contraindicated.
 - b. Axillary measurement is not as accurate as the oral, rectal, tympanic, or temporal artery method but is used when other methods of measurement are not possible.
 - c. The thermometer is placed in the client's dry axilla and the client is asked to hold the arm tightly against the chest, resting the arm on the chest; follow the instructions accompanying the measurement device for the amount of time the thermometer should remain in the axillary area.
4. Tympanic
 - a. The auditory canal is checked for the presence of redness, swelling, discharge, or a foreign body before the probe is inserted; the probe should not be inserted if the client has an inflammatory condition of the auditory canal or if there is discharge from the ear.
 - b. The reading may be affected by an ear infection or excessive wax blocking the ear canal.
5. Temporal artery
 - a. Ensure that the client's forehead is dry.
 - b. The thermometer probe is placed flush against the skin and slid across the forehead or placed in the area of the temporal artery and held in place.
 - c. If the client is diaphoretic, the temporal artery thermometer probe may be placed on the neck, just behind the earlobe.

III. Pulse**A. Description**

1. The average adult pulse (heart) rate is 60 to 100 beats/min.
2. Changes in pulse rate are used to evaluate the client's tolerance of interventions such as ambulation, bathing, dressing, and exercise.
3. Pedal pulses are checked to determine whether the circulation is blocked in the artery up to that pulse point.
4. When the pedal pulse is difficult to locate, a Doppler ultrasound stethoscope (ultrasonic stethoscope) may be needed to amplify the sounds of pulse waves.

B. Nursing considerations

1. The heart rate slows with age.
2. Exercise increases the heart rate.
3. Emotions stimulate the sympathetic nervous system, increasing the heart rate.

4. Pain increases the heart rate.
 5. Increased body temperature causes the heart rate to increase.
 6. Stimulant medications increase the heart rate; depressants and medications affecting the cardiac system slow it.
 7. When the BP is low, the heart rate is usually increased.
 8. Hemorrhage increases the heart rate.
- C. Assessing pulse qualities
1. When the pulse is being counted, note the rate, rhythm, and strength (force or amplitude).
 2. Once you have checked these parameters, use the grading scale for pulses to assess the information you have elicited (Box 10-2).
- D. Pulse points and locations
1. The temporal artery can be palpated anterior to or in the front of the ear.
 2. The carotid artery is located in the groove between the trachea and the sternocleidomastoid muscle, medial to and alongside the muscle.
 3. The apical pulse may be detected at the left mid-clavicular, fifth intercostal space.
 4. The brachial pulse is located above the elbow at the antecubital fossa, between the biceps and triceps muscles.
 5. The radial pulse is located in the groove along the radial or thumb side of the client's inner wrist.
 6. The femoral pulse is located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine.
 7. The popliteal pulse is located behind the knee.
 8. The posterior tibial pulse is located on the inner side of the ankle, behind and below the medial malleolus (ankle bone).
 9. The dorsalis pedis pulse is located on the top of the foot, in line with the groove between the extensor tendons of the great and first toes.

 The apical pulse is counted for 1 full minute and is assessed in clients with an irregular radial pulse or a heart condition, before the administration of cardiac medications such as digoxin and beta blockers, and in children younger than 2 years.

- E. Pulse deficit
1. In this condition, the peripheral pulse rate (radial pulse) is less than the ventricular contraction rate (apical pulse).

2. A pulse deficit indicates a lack of peripheral perfusion; can be an indication of cardiac dysrhythmias.
3. One-examiner technique: Auscultate and count the apical pulse first and then immediately count the radial pulse.
4. Two-examiner technique: One person counts the apical pulse and the other counts the radial pulse simultaneously.
5. A pulse deficit indicates that cardiac contractions are ineffective, failing to send pulse waves to the periphery.
6. If a difference in pulse rate is noted, the HCP is notified.

IV. Respirations

A. Description

1. Respiratory rates vary with age.
2. The normal adult respiratory rate is 12 to 20 breaths/min.

B. Nursing considerations

1. Many of the factors that affect the pulse rate also affect the respiratory rate.
2. An increased level of carbon dioxide or a lower level of oxygen in the blood results in an increase in respiratory rate.
3. Head injury or increased intracranial pressure will depress the respiratory center in the brain, resulting in shallow respirations or slowed breathing.
4. Medications such as opioid analgesics depress respirations.

C. Assessing respiratory rate

1. Count the client's respirations after measuring the radial pulse. (Continue holding the client's wrist while counting the respirations or position the hand on the client's chest.)
2. One respiration includes both inspiration and expiration.
3. The rate, depth, pattern, and sounds are assessed.

 The respiratory rate may be counted for 30 seconds and multiplied by 2, except in a client who is known to be very ill or is exhibiting irregular respirations, in which case respirations are counted for 1 full minute.

V. Blood Pressure

A. Description

1. BP is the force on the walls of an artery exerted by the pulsating blood under pressure from the heart.
2. The heart's contraction forces blood under high pressure into the aorta; the peak of maximum pressure when ejection occurs is the systolic pressure; the blood remaining in the arteries when the ventricles relax exerts a force known as the diastolic pressure.
3. The difference between the systolic and diastolic pressures is called the pulse pressure.

BOX 10-2 Grading Scale for Pulses

- 4+¼ Strong and bounding
- 3+¼ Full pulse, increased
- 2+¼ Normal, easily palpable
- 1+¼ Weak, barely palpable
- 0 ¼ Absent, not palpable

BOX 10-3 Hypertension Classifications

Prehypertension: A systolic blood pressure (BP) of 120 to 139 mm Hg or a diastolic pressure of 80 to 89 mm Hg

Stage 1: A systolic BP of 140 to 159 mm Hg or a diastolic pressure of 90 to 99 mm Hg

Stage 2: A systolic BP equal to or greater than 160 mm Hg or a diastolic pressure equal to or greater than 100 mm Hg

4. For an adult (age 18 and older), a normal BP is a systolic pressure below 120 mm Hg and a diastolic pressure below 80 mm Hg.
5. Classifications include prehypertension and stage 1 and stage 2 hypertension (Box 10-3).
6. In postural (orthostatic) hypotension, a normotensive client exhibits symptoms and low BP on rising to an upright position.
7. To obtain orthostatic vital sign measurements, check the BP and pulse with the client supine, sitting, and standing; readings are obtained 1 to 3 minutes after the client changes position.

B. Nursing considerations

1. Factors affecting BP
 - a. BP tends to increase as the aging process progresses.
 - b. Stress results in sympathetic stimulation that increases the BP.
 - c. The incidence of high BP is higher among African Americans than among Americans of European descent.
 - d. Antihypertensive medications and opioid analgesics can decrease BP.
 - e. BP is typically lowest in the early morning, gradually increases during the day, and peaks in the late afternoon and evening.
 - f. After puberty, males tend to have higher BP than females; after menopause, women tend to have higher BP than men of the same age.
2. Guidelines for measuring BP
 - a. Determine the best site for assessment.
 - b. Avoid applying a cuff to an extremity into which intravenous (IV) fluids are infusing, where an arteriovenous shunt or fistula is present, on the side on which breast or axillary surgery has been performed, or on an extremity that has been traumatized or is diseased.
 - c. The leg may be used if the brachial artery is inaccessible; the cuff is wrapped around the thigh and the stethoscope is placed over the popliteal artery.
 - d. Ensure that the client has not smoked or exercised in the 30 minutes before measurement because both activities can yield falsely high readings.

- e. Have the client assume a sitting (with feet flat on floor) or lying position and then rest for 5 minutes before the measurement; ask the client not to speak during the measurement.
- f. Ensure that the cuff is fully deflated, then wrap it evenly and snugly around the extremity.
- g. Ensure that the stethoscope being used fits the examiner and does not impair hearing.
- h. Document the first Korotkoff sound at phase 1 (heard as the blood pulsates through the vessel when air is released from the BP cuff and pressure on the artery is reduced) as the systolic pressure and the beginning of the fifth Korotkoff sound at phase 5 as the diastolic pressure.
- i. BP readings obtained electronically with a vital sign monitoring machine should be checked with a manual cuff if there is any concern about the accuracy of the reading.

 When taking a BP, select the appropriate cuff size; a cuff that is too small will yield a falsely high reading, and a cuff that is too large will yield a falsely low one.

VI. Pulse Oximetry**A. Description**

1. Pulse oximetry is a noninvasive test that registers the oxygen saturation of the client's hemoglobin.
2. The capillary oxygen saturation (SaO_2) is recorded as a percentage.
3. The normal value is 95% to 100%.
4. After a hypoxic client uses up the readily available oxygen (measured as the arterial oxygen pressure, PaO_2 , on arterial blood gas [ABG] testing), the reserve oxygen, that oxygen attached to the hemoglobin (SaO_2), is drawn on to provide oxygen to the tissues.
5. A pulse oximeter reading can alert the nurse to hypoxemia before clinical signs occur.
6. If pulse oximetry readings are below normal, instruct the client in deep breathing technique and recheck the pulse oximetry.

B. Procedure

1. A sensor is placed on the client's finger, toe, nose, earlobe, or forehead to measure oxygen saturation, which then is displayed on a monitor.
2. Maintain the transducer at heart level.
3. Do not select an extremity with an impediment to blood flow.

 A usual pulse oximetry reading is between 95% and 100%. A pulse oximetry reading lower than 90% necessitates HCP notification; values below 90% are acceptable only in certain chronic conditions. Agency procedures and HCP prescriptions are followed regarding actions to take for specific readings.

VII. Pain

A. Types of pain

1. **Acute:** Usually associated with an injury, medical condition, or surgical procedure; lasts hours to a few days
2. **Chronic:** Usually associated with long-term or chronic illnesses or disorders; may continue for months or even years
3. **Phantom:** Occurs after the loss of a body part (amputation); may be felt in the amputated part for years after the amputation

B. Assessment

1. Pain is a highly individual experience.
2. Ask the client to describe pain in terms of degree, quality, area, and frequency.
3. Ask the client about the use of complementary and alternative therapies to alleviate pain.
4. Pain experienced by the older client may be manifested differently than pain experienced by members of other age groups (e.g., sleep disturbances, changes in gait and mobility, decreased socialization, depression).
5. Clients with cognitive disorders (e.g., a client with dementia, a comatose client) may not be able to describe their pain experiences.
6. The nurse should be alert to nonverbal indicators of pain (**Box 10-4**).
7. Ask the client to use a number-based pain scale (a picture-based scale may be used in children or clients who cannot verbally describe their pain) to rate the degree of pain (**Fig. 10-1**).
8. Evaluate client response to nonpharmacological interventions.

! Consider the client's culture in assessing pain; some cultures, including many Asian cultures, frown on the outward expression of pain.

C. Conventional nonpharmacological interventions

1. **Cutaneous stimulation**
 - a. Techniques include heat, cold, and pressure and vibration. Therapeutic touch and massage are also cutaneous stimulation and may be considered complementary and alternative techniques.

BOX 10-4 Nonverbal Indicators of Pain

- Moaning
- Crying
- Irritability
- Restlessness
- Grimacing or frowning
- Inability to sleep
- Rigid posture
- Increased blood pressure, heart rate, or respiratory rate
- Nausea
- Diaphoresis

A

B

FIGURE 10-1 Pain assessment scales. A, Numerical, descriptive, and visual analog scales. B, Wong-Baker FACES® Pain Rating Scale. (B, Copyright 1983, Wong-Baker FACES® Foundation, www.WongBakerFACES.org. Used with permission. Originally published in Whaley & Wong's Nursing Care of Infants and Children. ©Elsevier Inc.)

- a. Such treatments may require an HCP's prescription.
2. **Transcutaneous electrical nerve stimulation (TENS)**
 - a. TENS is also referred to as percutaneous electrical nerve stimulation (PENS).
 - b. This technique, which may require an HCP's prescription, involves the application of a battery-operated device that delivers a low electrical current to the skin and underlying tissues to block pain.
 3. **Binders, slings, and other supportive devices**
 - a. Cloths or other materials or devices, wrapped around a limb or body part, can ease the pain of strains, sprains, and surgical incisions.
 - b. Such devices may require an HCP's prescription.
 - c. Elevation of the affected body part is another intervention that can reduce swelling; supporting an extremity on a pillow may lessen discomfort.
 4. **Heat and cold**
 - a. The application of heat and cold or alternating application of the two can soothe pain resulting from muscle strain.
 - b. Such treatment may require an HCP's prescription.

- c. Heat applications may include warm-water compresses, warm blankets, thermal pads, and tub and whirlpool baths.
- d. The temperature of the application must be monitored carefully to help prevent burns; the skin of very young and older clients is extra sensitive to heat.
- e. The application of cold can reduce swelling and muscle spasms and ease pain in joints and muscles.
- f. The client should be advised to remove the source of heat or cold if changes in sensation or discomfort occur. If the change in sensation or discomfort is not relieved after removal of the application, the HCP should be notified.

 **Ice or heat should be applied with a towel or other barrier between the pack and the skin, but should not be left in place for more than 15 to 30 minutes.**

D. Complementary and alternative therapies

1. Description: Therapies are used in addition to conventional treatment to provide healing resources and focus on the mind-body connection (Box 10-5).
2. Nursing considerations
 - a. Some complementary and alternative therapies require an HCP's prescription.
 - b. Herbal remedies are considered pharmacological therapy by some HCPs; because of the risk for interaction with prescription medications, it is important that the nurse ask the client about the use of such therapies.
 - c. If spiritual measures are to be employed, the nurse must elicit from the client the preferred forms of spiritual expression and learn when they are practiced so that they may be integrated into the plan of care.

BOX 10-5 Complementary and Alternative Therapies

Acupuncture and acupressure
 Biofeedback
 Chiropractic manipulation
 Distraction techniques
 Guided imagery and meditation techniques
 Herbal therapies
 Hypnosis
 Laughter and humor
 Massage
 Relaxation and repositioning techniques
 Spiritual measures (e.g., prayer, use of a rosary or prayer beads, reading of scripture)
 Therapeutic touch

VIII. Pharmacological Interventions

A. Nonopioid analgesics

1. Nonsteroidal antiinflammatory drugs (NSAIDs) and acetylsalicylic acid (Aspirin) (Box 10-6)
 - a. These medication types are contraindicated if the client has gastric irritation or ulcer disease or an allergy to the medication.
 - b. Bleeding is a concern with the use of these medication types.
 - c. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
 - d. NSAIDs can amplify the effects of anticoagulants.
 - e. Hypoglycemia may result for the client taking ibuprofen if the client is concurrently taking an oral hypoglycemic agent.
 - f. A high risk of toxicity exists if the client is taking ibuprofen concurrently with a calcium channel blocker.
2. Acetaminophen
 - a. Acetaminophen, commonly known as Tylenol, is contraindicated in clients with hepatic or renal disease, alcoholism, or hypersensitivity.
 - b. Assess the client for a history of liver dysfunction.
 - c. Monitor the client for signs of hepatic damage (e.g., nausea and vomiting, diarrhea, abdominal pain).
 - d. Monitor liver function parameters.
 - e. Tell the client that self-medication should not continue longer than 10 days in an adult or 5 days in a child because of the risk of hepatotoxicity.
 - f. The antidote to acetaminophen is acetylcysteine.

BOX 10-6 Side and Adverse Effects of NSAIDs and Acetylsalicylic Acid

NSAIDs

- Gastric irritation
- Hypotension
- Sodium and water retention
- Blood dyscrasias
- Dizziness
- Tinnitus
- Pruritus

Acetylsalicylic Acid

- Gastric irritation
- Flushing
- Tinnitus
- Drowsiness
- Headaches
- Vision changes

 The major concern with acetaminophen is hepatotoxicity.

B. Opioid analgesics

1. Description

- a. These medications suppress pain impulses but can also suppress respiration and coughing by acting on the respiratory and cough center, located in the medulla of the brainstem.
- b. Review the client's history and note that clients with impaired renal or liver function may only be able to tolerate low doses of opioid analgesics.
- c. Intravenous route administration produces a faster effect than other routes but the effect lasts shorter to relieve pain
- d. Opioids, which produce euphoria and sedation, can cause physical dependence.
- e. Administer the medication 30 to 60 minutes before painful activities.
- f. Monitor the respiratory rate; if it is slower than 12 breaths/min in an adult, withhold the medication and notify the HCP.
- g. Monitor the pulse; if bradycardia develops, withhold the medication and notify the HCP.
- h. Monitor the BP for hypotension and assess before administering pain medications to decrease the risk of adverse effects.
- i. Auscultate the lungs for normal breath sounds.
- j. Encourage activities such as turning, deep breathing, and incentive spirometry to help prevent atelectasis and pneumonia.
- k. Monitor the client's level of consciousness.
- l. Initiate safety precautions.
- m. Monitor intake and output and assess the client for urine retention.
- n. Instruct the client to take oral doses with milk or a snack to reduce gastric irritation.
- o. Instruct the client to avoid activities that require alertness.
- p. Assess the effectiveness of the medication 30 minutes after administration.
- q. Have an opioid antagonist (e.g., naloxone), oxygen, and resuscitation equipment available.

 An electronic infusion device is always used for continuous or dose-demand IV infusion of opioid analgesics.

2. Codeine sulfate

- a. This medication is also used in low doses as a cough suppressant.
- b. It may cause constipation.
- c. Common medications in this class are hydrocodone and oxycodone (synthetic forms).

3. Hydromorphone

- a. The primary concern is respiration depression.
- b. Other effects include drowsiness, dizziness, and orthostatic hypotension.
- c. Monitor vital signs, especially the respiratory rate and BP.

4. Morphine sulfate

- a. Morphine sulfate is used to ease acute pain resulting from myocardial infarction or cancer, for dyspnea resulting from pulmonary edema, and as a preoperative medication.
- b. The major concern is respiratory depression, but postural hypotension, urine retention, constipation, and pupillary constriction may also occur; monitor the client for adverse effects.
- c. Morphine may cause nausea and vomiting by increasing vestibular sensitivity.
- d. It is contraindicated in severe respiratory disorders, head injuries, severe renal disease, or seizure activity, and in the presence of increased intracranial pressure.
- e. Monitor the client for urine retention.
- f. Monitor bowel sounds for decreased peristalsis; constipation may occur.
- g. Monitor the pupil for changes; pinpoint pupils may indicate overdose.

IX. Laboratory Reference Intervals

For reference throughout the chapter, see [Figure 10-2](#).

A. Methods for drawing blood ([Table 10-1](#))

B. Serum sodium

1. A major cation of extracellular fluid.
2. Maintains osmotic pressure and acid-base balance, and assists in the transmission of nerve impulses.
3. Is absorbed from the small intestine and excreted in the urine in amounts dependent on dietary intake.
4. Normal reference interval: 135 to 145 mEq/L (135 to 145 mmol/L).

 Drawing blood specimens from an extremity in which an IV solution is infusing can produce an inaccurate result, depending on the test being performed and the type of solution infusing. Prolonged use of a tourniquet before venous sampling can increase the blood level of potassium, producing an inaccurate result.

C. Serum potassium

1. A major intracellular cation, potassium regulates cellular water balance, electrical conduction in muscle cells, and acid-base balance.
2. The body obtains potassium through dietary ingestion and the kidneys preserve or excrete potassium, depending on cellular need.

FIGURE 10-2 Approximate values for the components of blood in a normal adult.

TABLE 10-1 Obtaining a Blood Sample

Venipuncture	Peripheral Intravenous Line	Central Intravenous Line
Check health care provider's (HCP's) prescription.	Check HCP's prescription.	Check HCP's prescription.
Identify foods, medications, or other factors that may affect the procedure or results.	Identify foods, medications, or other factors such as the type of solution infusing that may affect the procedure or results.	Identify foods, medications, or other factors such as the type of solution infusing that may affect the procedure or results.
Gather needed supplies, including gloves, needle (appropriate gauge and size), transfer/collection device per agency policy, specimen containers per agency policy, tourniquet, antiseptic swabs, 2 × 2 inch gauze, tape, tube label(s), biohazard bag, requisition form or bar code per agency policy.	Gather needed supplies, including gloves, tourniquet, transparent dressing or other type of dressing, tape, 2 × 2 inch gauze, antiseptic agent, extension set (optional), two 5- or 10-mL normal saline flushes, one empty 5- or 10-mL syringe (depending on the amount of blood needed), transfer/collection device per agency policy, specimen containers per agency policy, alcohol-impregnated intravenous (IV) line end caps, tube labels, biohazard bag, requisition form or bar code per agency policy.	Gather needed supplies, including gloves, transfer/collection device per agency policy, specimen containers per agency policy, two 5- or 10-mL normal saline flushes, one empty 5- or 10-mL syringe (depending on the amount of blood needed), antiseptic swabs, alcohol-impregnated IV line end caps, 2 masks, biohazard bag, requisition form or bar code per agency policy.
Perform hand hygiene. Identify the client with at least 2 accepted identifiers.	Perform hand hygiene. Identify the client with at least 2 accepted identifiers.	Perform hand hygiene. Identify the client with at least 2 accepted identifiers.
Explain the purpose of the test and procedure to the client.	Explain the purpose of the test and procedure to the client.	Explain the purpose of the test and procedure to the client.
Apply clean gloves. Place the client in a lying position or a semi-Fowler's position. Place a small pillow or towel under the extremity.	Prepare extension set if being used by priming with normal saline. Attach syringe to extension set. Place extension set within reach while maintaining aseptic technique and keeping it in the package.	Place mask on self and client or ask client to turn the head away. Stop any running infusions for at least 1 minute.
Apply tourniquet 5 to 10 cm above the venipuncture site so it can be removed in 1 motion.	Apply tourniquet 10 to 15 cm above intravenous site.	Clamp all ports. Scrub port to be used with antiseptic swab.
Ask the client to open and close the fist several times, then clench the fist.	Apply gloves. Scrub tubing insertion port with antiseptic solution or per agency policy.	Attach 5- or 10-mL normal saline flush and unclamp line. Flush line with appropriate amount per agency policy and withdraw 5-10 mL of blood to discard (per agency policy). Clamp line and detach flush.

Continued

TABLE 10-1 Obtaining a Blood Sample—cont'd

Venipuncture	Peripheral Intravenous Line	Central Intravenous Line
Inspect to determine the vein to be used for venipuncture. Select the vein based on size and quality. Use the most distal site in the nondominant arm if possible. Palpate the vein with the index finger for resilience.	Attach 5- or 10-mL normal saline flush and unclamp line. Flush line with appropriate amount per agency policy and withdraw 5-10 mL of blood to discard (per agency policy). Clamp line and detach flush syringe.	Scrub port with antiseptic swab. Attach 5- or 10-mL syringe or transfer/collection device to port (depending on available equipment), unclamp line, and withdraw needed sample or attach specimen container to withdraw using vacuum system. Clamp line and detach syringe or transfer/collection device.
Clean site with antiseptic swabs or per agency policy, using a circular scrubbing motion, inward to outward for 30 seconds. Insert the needle bevel up at a 15- to 30-degree angle. Collect blood in collection device per agency policy.	Scrub tubing insertion port. Attach 5- or 10-mL syringe, extension set, or transfer/collection device to port (depending on available equipment), unclamp line, and withdraw needed sample or attach specimen container to withdraw using vacuum system. Clamp line and detach syringe or transfer/collection device.	Scrub port with antiseptic swab. Attach a 5- or 10-mL normal saline flush. Unclamp line and flush with amount per agency policy. Clamp line, remove flush, and place end cap on IV line. Remove masks.
Release tourniquet. Apply 2 × 2 inch gauze over insertion site. Remove needle and engage safety on needle. Apply pressure for 2 minutes. If the client is on anticoagulants, apply pressure for several minutes. Perform hand hygiene.	Remove tourniquet and flush with normal saline to ensure patency.	Transfer specimen to collection device per agency policy if not previously collected.
Send specimen to the laboratory in biohazard bag with associated requisition forms or bar codes per agency policy.	Send specimen to the laboratory in biohazard bag with associated requisition forms or bar codes per agency policy.	Send specimen to the laboratory in biohazard bag with associated requisition forms or bar codes per agency policy.

3. Potassium levels are used to evaluate cardiac function, renal function, gastrointestinal function, and the need for IV replacement therapy.
4. If the client is receiving a potassium supplementation, this needs to be noted on the laboratory form.
5. Clients with elevated white blood cell (WBC) counts and platelet counts may have falsely elevated potassium levels.
6. Normal reference interval: 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L)

D. Activated partial thromboplastin time (aPTT)

1. The aPTT evaluates how well the coagulation sequence (intrinsic clotting system) is functioning by measuring the amount of time it takes in seconds for recalcified citrated plasma to clot after partial thromboplastin is added to it.
2. The test screens for deficiencies and inhibitors of all factors, except factors VII and XIII.
3. Usually, the aPTT is used to monitor the effectiveness of heparin therapy and screen for coagulation disorders.
4. Normal reference interval: 28 to 35 seconds (conventional and SI units), depending on the type of activator used.
5. If the client is receiving intermittent heparin therapy, draw the blood sample 1 hour before the next scheduled dose.

6. Do not draw samples from an arm into which heparin is infusing.
7. Transport specimen to the laboratory immediately.
8. Provide direct pressure to the venipuncture site for 3 to 5 minutes.
9. The aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy.

! If the aPTT value is prolonged (longer than 87.5 seconds or per agency policy) in a client receiving IV heparin therapy or in any client at risk for thrombocytopenia, initiate bleeding precautions.

E. Prothrombin time (PT) and international normalized ratio (INR)

1. Prothrombin is a vitamin K-dependent glycoprotein produced by the liver that is necessary for fibrin clot formation.
2. Each laboratory establishes a normal or control value based on the method used to perform the PT test.
3. The PT measures the amount of time it takes in seconds for clot formation and is used to monitor response to warfarin sodium therapy or to screen for dysfunction of the extrinsic clotting system resulting from liver disease, vitamin K deficiency, or disseminated intravascular coagulation.

4. A PT value within 2 seconds (plus or minus) of the control is considered normal.
5. The INR is a frequently used test to measure the effects of some anticoagulants.
6. The INR standardizes the PT ratio and is calculated in the laboratory setting by raising the observed PT ratio to the power of the international sensitivity index specific to the thromboplastin reagent used.
7. If a PT is prescribed, baseline specimen should be drawn before anticoagulation therapy is started; note the time of collection on the laboratory form.
8. Provide direct pressure to the venipuncture site for 3 to 5 minutes.
9. Concurrent warfarin therapy with heparin therapy can lengthen the PT for up to 5 hours after dosing.
10. Diets high in green leafy vegetables can increase the absorption of vitamin K, which shortens the PT.
11. Orally administered anticoagulation therapy usually maintains the PT at 1.5 to 2 times the laboratory control value.
12. Normal reference intervals
 - a. PT: 11 to 12.5 seconds (conventional and SI units)
 - b. INR: 2 to 3 for standard warfarin therapy
 - c. INR: 3 to 4.5 for high-dose warfarin therapy

 **If the PT value is longer than 32 seconds and the INR is greater than 3.0 in a client receiving standard warfarin therapy (or per agency policy), initiate bleeding precautions.**

F. Platelet count

1. Platelets function in hemostatic plug formation, clot retraction, and coagulation factor activation.
2. Platelets are produced by the bone marrow to function in hemostasis.
3. Normal reference interval: 150,000-400,000 mm³ (150–400 × 10⁹/L)
4. Monitor the venipuncture site for bleeding in clients with known thrombocytopenia.
5. High altitudes, chronic cold weather, and exercise increase platelet counts.
6. Bleeding precautions should be instituted in clients when the platelet count falls sufficiently below the normal level; the specific value for implementing bleeding precautions usually is determined by agency policy.

 **Monitor the platelet count closely in clients receiving chemotherapy because of the risk for thrombocytopenia. In addition, any client who will be having an invasive procedure (such as a liver biopsy or thoracentesis) should have coagulation studies and platelet counts done before the procedure.**

TABLE 10-2 Hemoglobin and Hematocrit: Reference Intervals

Blood Component	Reference Interval
Hemoglobin (altitude dependent)	
Male adult	14-18 g/dL (140-180 mmol/L)
Female adult	12-16 g/dL (120-160 mmol/L)
Hematocrit (altitude dependent)	
Male adult	42%-52% (0.42-0.52)
Female adult	37%-47% (0.37-0.47)

G. Hemoglobin and hematocrit

1. Hemoglobin is the main component of erythrocytes and serves as the vehicle for transporting oxygen and carbon dioxide.
2. Hematocrit represents red blood cell (RBC) mass and is an important measurement in the presence of anemia or polycythemia ([Table 10-2](#)).
3. Fasting is not required for this test.

H. Lipids

1. Blood lipids consist primarily of cholesterol, triglycerides, and phospholipids.
2. Lipid assessment includes total cholesterol, high-density lipoprotein (HDL), low-density lipoprotein (LDL), and triglycerides.
3. Cholesterol is present in all body tissues and is a major component of LDLs, brain and nerve cells, cell membranes, and some gallbladder stones.
4. Triglycerides constitute a major part of very low-density lipoproteins and a small part of LDLs.
5. Triglycerides are synthesized in the liver from fatty acids, protein, and glucose, and are obtained from the diet.
6. Increased cholesterol levels, LDL levels, and triglyceride levels place the client at risk for coronary artery disease.
7. HDL helps to protect against the risk of coronary artery disease.
8. Oral contraceptives may increase the lipid level.
9. Instruct the client to abstain from food and fluid, except for water, for 12 to 14 hours and from alcohol for 24 hours before the test.
10. Instruct the client to avoid consuming high-cholesterol foods with the evening meal before the test.
11. Normal reference intervals ([Table 10-3](#)).

I. Fasting blood glucose

1. Glucose is a monosaccharide found in fruits and is formed from the digestion of carbohydrates and the conversion of glycogen by the liver.
2. Glucose is the main source of cellular energy for the body and is essential for brain and erythrocyte function.

TABLE 10-3 Lipids: Reference Intervals

Blood Component	Reference Interval
Cholesterol	< 200 mg/dL (< 5.2 mmol/L)
High-density lipoproteins (HDLs)	Male: > 40 mg/dL (> 1.04 mmol/L) Female: > 50 mg/dL (> 1.3 mmol/L)
Low-density lipoproteins (LDLs)	Recommended: < 100 mg/dL (< 2.6 mmol/L) Near optimal: 100-129 mg/dL (2.6-3.34 mmol/L) Moderate risk for coronary artery disease (CAD): 130-159 mg/dL (3.37-4.12 mmol/L) High risk for CAD: > 160 mg/dL (> 4.14 mmol/L)
Triglycerides	< 150 mg/dL (< 1.7 mmol/L)

3. Fasting blood glucose levels are used to help diagnose diabetes mellitus and hypoglycemia.
4. Instruct the client to fast for 8 to 12 hours before the test.
5. Instruct a client with diabetes mellitus to withhold morning insulin or oral hypoglycemic medication until after the blood is drawn.
6. Normal reference interval: glucose (fasting) 70-110 mg/dL (4-6 mmol/L)

J. Glycosylated hemoglobin (HgbA1C)

1. HgbA1C is blood glucose bound to hemoglobin.
2. Hemoglobin A_{1c} (glycosylated hemoglobin A; HbA_{1c}) is a reflection of how well blood glucose levels have been controlled for the past 3 to 4 months.
3. Hyperglycemia in clients with diabetes is usually a cause of an increase in the HbA_{1c}.
4. Fasting is not required before the test.
5. Normal reference intervals: 4.0%–6.0% (4.0%–6.0%)

TABLE 10-4 Glycosylated Hemoglobin (HgbA1C) and Estimated Average Glucose (eAG)

HgbA1C %	eAG mg/dL	eAG mmol/L
6	126	7.0
6.5	140	7.8
7	154	8.6
7.5	169	9.4
8	183	10.1
8.5	197	10.9
9	212	11.8
9.5	226	12.6
10	240	13.4

American Diabetes Association, DiabetesPro: Estimated average glucose, eAG/A1C Conversion Calculator (website): http://professional.diabetes.org/diapro/glucose_calc.

6. HgbA1C and estimated average glucose (eAG) reference intervals (Table 10-4).

K. Renal function studies

1. **Serum** creatinine
 - a. Creatinine is a specific indicator of renal function.
 - b. Increased levels of creatinine indicate a slowing of the glomerular filtration rate.
 - c. Instruct the client to avoid excessive exercise for 8 hours and excessive red meat intake for 24 hours before the test.
 - d. Normal reference interval: 0.6–1.3 mg/dL (53–115 μmol/L)
2. **Blood urea nitrogen (BUN)**
 - a. Urea nitrogen is the nitrogen portion of urea, a substance formed in the liver through an enzymatic protein breakdown process.
 - b. Urea is normally freely filtered through the renal glomeruli, with a small amount reabsorbed in the tubules and the remainder excreted in the urine.
 - c. Elevated levels indicate a slowing of the glomerular filtration rate.
 - d. BUN and creatinine ratios should be analyzed when renal function is evaluated.
 - e. Normal reference interval: 6–20 mg/dL (2.1–7.1 mmol/L)

L. White **blood cell** (WBC) count

1. WBCs function in the immune defense system of the body.
2. The WBC differential provides specific information on WBC types.
3. A “shift to the left” (in the differential) means that an increased number of immature neutrophils is present in the **blood**.
4. A low total WBC count with a left shift indicates a recovery from bone marrow depression or an infection of such intensity that the demand for neutrophils in the tissue is higher than the capacity of the bone marrow to release them into the circulation.
5. A high total WBC count with a left shift indicates an increased release of neutrophils by the bone marrow in response to an overwhelming infection or inflammation.
6. An increased neutrophil count with a left shift is usually associated with bacterial infection.
7. A “shift to the right” means that cells have more than the usual number of nuclear segments; found in liver disease, Down syndrome, and megaloblastic and pernicious anemia.
8. Normal reference interval: 5000–10,000 mm³ (5.0–10.0 × 10⁹/L)

! Monitor the WBC count and differential closely in clients receiving chemotherapy because of the risk for neutropenia; neutropenia places the client at risk for infection.

CRITICAL THINKING What Should You Do?

Answer: The client's vital signs are showing a significant change, particularly the blood pressure, heart rate, and oxygen saturation levels. The nurse should first compare the vital signs to the set of baseline vital signs obtained when the client arrived to the unit. This provides information about how much of a change has occurred in these parameters. The nurse should quickly consider the following when determining the next action: (1) Is the equipment working properly? (2) Is the correct equipment being used? (3) Is there a condition or procedure in the client's history that can be attributed to this change? (4) Are there environmental factors that could influence the change in the client's vital signs? (5) Does this change necessitate contacting the surgeon? Given the significant change from the baseline vital signs, and after checking equipment to ensure it is working properly, the nurse should then determine that it is necessary to contact the surgeon to inform him or her of this change, especially considering that the client recently had surgery and there is a potential for bleeding. The nurse should determine if there is any sign of bleeding, ie, drainage on the dressing, bloody output in a surgical drain, swelling in the surgical area suggestive of hematoma. The charge nurse should also be informed of the change in client status.

References: Lewis et al. (2014), pp. 350, 354; Potter et al. (2015), p. 272.

PRACTICE QUESTIONS

63. A client with atrial fibrillation who is receiving maintenance therapy of warfarin sodium has a prothrombin time (PT) of 35 (35) seconds and an international normalized ratio (INR) of 3.5. On the basis of these laboratory values, the nurse anticipates which prescription?
1. Adding a dose of heparin sodium
 2. Holding the next dose of warfarin
 3. Increasing the next dose of warfarin
 4. Administering the next dose of warfarin
64. A staff nurse is precepting a new graduate nurse and the new graduate is assigned to care for a client with chronic pain. Which statement, if made by the new graduate nurse, indicates the need for further teaching regarding pain management?
1. "I will be sure to ask my client what his pain level is on a scale of 0 to 10."
 2. "I know that I should follow up after giving medication to make sure it is effective."
 3. "I know that pain in the older client might manifest as sleep disturbances or depression."
 4. "I will be sure to cue in to any indicators that the client may be exaggerating their pain."
65. A client has been admitted to the hospital for urinary tract infection and dehydration. The nurse determines that the client has received adequate volume replacement if the blood urea nitrogen (BUN) level drops to which value?
1. 3 mg/dL (1.05 mmol/L)
 2. 15 mg/dL (5.25 mmol/L)
 3. 29 mg/dL (10.15 mmol/L)
 4. 35 mg/dL (12.25 mmol/L)
66. The nurse is explaining the appropriate methods for measuring an accurate temperature to an unlicensed assistive personnel (UAP). Which method, if noted by the UAP as being an appropriate method, indicates the need for further teaching?
1. Taking a rectal temperature for a client who has undergone nasal surgery
 2. Taking an oral temperature for a client with a cough and nasal congestion
 3. Taking an axillary temperature for a client who has just consumed hot coffee
 4. Taking a temporal temperature on the neck behind the ear for a client who is diaphoretic
67. A client is receiving a continuous intravenous infusion of heparin sodium to treat deep vein thrombosis. The client's activated partial thromboplastin time (aPTT) is 65 seconds (65 seconds). The nurse anticipates that which action is needed?
1. Discontinuing the heparin infusion
 2. Increasing the rate of the heparin infusion
 3. Decreasing the rate of the heparin infusion
 4. Leaving the rate of the heparin infusion as is
68. A client with a history of cardiac disease is due for a morning dose of furosemide. Which serum potassium level, if noted in the client's laboratory report, should be reported before administering the dose of furosemide?
1. 3.2 mEq/L (3.2 mmol/L)
 2. 3.8 mEq/L (3.8 mmol/L)
 3. 4.2 mEq/L (4.2 mmol/L)
 4. 4.8 mEq/L (4.8 mmol/L)
- ❖ 69. Several laboratory tests are prescribed for a client, and the nurse reviews the results of the tests. Which laboratory test results should the nurse report? Select all that apply.
- 1. Platelets 35,000 mm³ (35 × 10⁹/L)
 - 2. Sodium 150 mEq/L (150 mmol/L)
 - 3. Potassium 5.0 mEq/L (5.0 mmol/L)
 - 4. Segmented neutrophils 40% (0.40)
 - 5. Serum creatinine, 1 mg/dL (88.3 μmol/L)
 - 6. White blood cells, 3000 mm³ (3.0 × 10⁹/L)

- ❖ 70. The nurse is caring for a client who takes ibuprofen for pain. The nurse is gathering information on the client's medication history, and determines it is necessary to contact the health care provider (HCP) if the client is also taking which medications? Select all that apply.
- 1. Warfarin
 - 2. Glimepiride
 - 3. Amlodipine
 - 4. Simvastatin
 - 5. Hydrochlorothiazide
71. A client with diabetes mellitus has a glycosylated hemoglobin A_{1c} level of 9%. On the basis of this test result, the nurse plans to teach the client about the need for which measure?
1. Avoiding infection
 2. Taking in adequate fluids
 3. Preventing and recognizing hypoglycemia
 4. Preventing and recognizing hyperglycemia
72. The nurse is caring for a client with a diagnosis of cancer who is immunosuppressed. The nurse would consider implementing neutropenic precautions if the client's white blood cell count was which value?
1. 2000 mm³ (2.0 × 10⁹/L)
 2. 5800 mm³ (5.8 × 10⁹/L)
 3. 8400 mm³ (8.4 × 10⁹/L)
 4. 11,500 mm³ (11.5 × 10⁹/L)
73. A client brought to the emergency department states that he has accidentally been taking 2 times his prescribed dose of warfarin for the past week. After noting that the client has no evidence of obvious bleeding, the nurse plans to take which action?
1. Prepare to administer an antidote.
 2. Draw a sample for type and crossmatch and transfuse the client.
 3. Draw a sample for an activated partial thromboplastin time (aPTT) level.
 4. Draw a sample for prothrombin time (PT) and international normalized ratio (INR).
74. The nurse is caring for a postoperative client who is receiving demand-dose hydromorphone via a patient-controlled analgesia (PCA) pump for pain control. The nurse enters the client's room and finds the client drowsy and records the following vital signs: temperature 97.2 °F (36.2 °C) orally, pulse 52 beats per minute, blood pressure 101/58 mm Hg, respiratory rate 11 breaths per minute, and SpO₂ of 93% on 3 liters of oxygen via nasal cannula. Which action should the nurse take next?
1. Document the findings.
 2. Attempt to arouse the client.
 3. Contact the health care provider (HCP) immediately.
 4. Check the medication administration history on the PCA pump.
75. An adult female client has a hemoglobin level of 10.8 g/dL (108 mmol/L). The nurse interprets that this result is most likely caused by which condition noted in the client's history?
1. Dehydration
 2. Heart failure
 3. Iron deficiency anemia
 4. Chronic obstructive pulmonary disease
76. A client with a history of gastrointestinal bleeding has a platelet count of 300,000 mm³ (300 × 10⁹/L). The nurse should take which action after seeing the laboratory results?
1. Report the abnormally low count.
 2. Report the abnormally high count.
 3. Place the client on bleeding precautions.
 4. Place the normal report in the client's medical record.

ANSWERS

63. 2

Rationale: The normal PT is 11 to 12.5 seconds (conventional therapy and SI units). The normal INR is 2 to 3 for standard warfarin therapy, which is used for the treatment of atrial fibrillation, and 3 to 4.5 for high-dose warfarin therapy, which is used for clients with mechanical heart valves. A therapeutic PT level is 1.5 to 2 times higher than the normal level. Because the values of 35 seconds and 3.5 are high, the nurse should anticipate that the client would not receive further doses at this time. Therefore, the prescriptions noted in the remaining options are incorrect.

Test-Taking Strategy: Focus on the **subject**, a PT of 35 seconds and an INR of 3.5. Recall the normal ranges for these values

and remember that a PT greater than 32 seconds and an INR greater than 3 for standard warfarin therapy places the client at risk for bleeding; this will direct you to the correct option.

Review: The **normal prothrombin time and INR levels**

64. 4

Rationale: Pain is a highly individual experience, and the new graduate nurse should not assume that the client is

exaggerating his pain. Rather, the nurse should frequently assess the pain and intervene accordingly through the use of both nonpharmacological and pharmacological interventions. The nurse should assess pain using a number-based scale or a picture-based scale for clients who cannot verbally describe their pain to rate the degree of pain. The nurse should follow up with the client after giving medication to ensure that the medication is effective in managing the pain. Pain experienced by the older client may be manifested differently than pain experienced by members of other age groups, and they may have sleep disturbances, changes in gait and mobility, decreased socialization, and depression; the nurse should be aware of this attribute in this population.

Test-Taking Strategy: Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and the need to select the incorrect statement as the answer. Recall that pain is a highly individual experience, and the nurse should not assume that the client is exaggerating pain.

65. 2

Rationale: The normal BUN level is 6 to 20 mg/dL (2.1 to 7.1 mmol/L). Values of 29 mg/dL (10.15 mmol/L) and 35 mg/dL (12.25 mmol/L) reflect continued dehydration. A value of 3 mg/dL (1.05 mmol/L) reflects a lower than normal value, which may occur with fluid volume overload, among other conditions.

Test-Taking Strategy: Focus on the **subject**, adequate fluid replacement and the normal BUN level. The correct option is the only option that identifies a normal value.

Review: The normal **blood urea nitrogen level**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Fundamentals of Care—Laboratory Values

Priority Concepts: Clinical Judgment; Fluid and Electrolyte Balance

References: Lewis et al. (2014), p. 1057; Pagana, Pagana (2014), pp. 511–514.

66. 2

Rationale: An oral temperature should be avoided if the client has nasal congestion. One of the other methods of measuring the temperature should be used according to the equipment available. Taking a rectal temperature for a client who has undergone nasal surgery is appropriate. Other, less invasive measures should be used if available; if not available, a rectal temperature is acceptable. Taking an axillary temperature on a client who just consumed coffee is also acceptable; however, the axillary method of measurement is the least reliable, and other methods should be used if available. If temporal equipment is available and the client is diaphoretic, it is acceptable to measure the temperature on the neck behind the ear, avoiding the forehead.

Test-Taking Strategy: Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and the need to select the incorrect action as the answer. Recall that nasal congestion is a reason to avoid taking an oral temperature, as the nasal congestion will cause problems with breathing while the temperature is being taken.

Review: **Temperature measurement methods**

Level of Cognitive Ability: Evaluating

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Fundamentals of Care—Vital Signs

Priority Concepts: Teaching and Learning; Thermoregulation

Reference: Perry, Potter, Ostendorf (2014), pp. 68–69, 76.

67. 4

Rationale: The normal aPTT varies between 28 and 35 seconds (28 and 35 seconds), depending on the type of activator used in testing. The therapeutic dose of heparin for treatment of deep vein thrombosis is to keep the aPTT between 1.5 (42 to 52.5) and 2.5 (70 to 87.5) times normal. This means that the client's value should not be less than 42 seconds or greater than 87.5 seconds. Thus the client's aPTT is within the therapeutic range and the dose should remain unchanged.

Test-Taking Strategy: Focus on the **subject**, the expected aPTT for a client receiving a heparin sodium infusion. Remember that the normal range is 28 to 35 seconds and that the aPTT should be between 1.5 and 2.5 times normal when the client is receiving heparin therapy. Simple multiplication of 1.5 and 2.5 by 28 and 35 will yield a range of 42 to 87.5 seconds). This client's value is 65 seconds

Review: The **aPTT level** and the expected level if the client is receiving **heparin**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Analysis

68. 1

Rationale: The normal serum potassium level in the adult is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). The correct option is the only value that falls below the therapeutic range. Administering furosemide to a client with a low potassium level and a history of cardiac problems could precipitate ventricular dysrhythmias. The remaining options are within the normal range.

Test-Taking Strategy: Note the **subject** of the question, the level that should be reported. This indicates that you are looking for an abnormal level. Remember, the normal serum potassium level in the adult is 3.5 to 5.0 mEq/L (3.5 to 5.0 mmol/L). This will direct you to the correct option.

Review: The normal **serum potassium level**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Laboratory Values

Priority Concepts: Clinical Judgment; Fluid and Electrolyte Balance

References: Lewis et al. (2014), p. 296; Pagana, Pagana (2014), p. 409.

❖ 69. 1, 2, 4, 6

Rationale: The normal values include the following: platelets 150,000–400,000 mm^3 ($150\text{--}400 \times 10^9/\text{L}$); sodium 135–145 mEq/L (135–145 mmol/L); potassium 3.5–5.0 mEq/L (3.5–5.0 mmol/L); segmented neutrophils 60%–70% (0.60–0.70); serum creatinine 0.6–1.3 mg/dL (53–115 $\mu\text{mol}/\text{L}$); and white blood cells 5000–10,000 mm^3 ($5.0\text{--}10.0 \times 10^9/\text{L}$). The platelet level noted is low; the sodium level noted is high; the potassium level noted is normal; the segmented neutrophil level noted is low; the serum creatinine level noted is normal; and the white blood cell level is low.

Test-Taking Strategy: Focus on the **subject**, the abnormal laboratory values that need to be reported. Recalling the normal laboratory values for the blood studies identified in the options will assist in answering this question.

Review: The normal **laboratory values**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Laboratory Values

Priority Concepts: Clinical Judgment; Collaboration

Reference: Lewis et al. (2014), pp. 626, 661, 1702–1703

❖ 70. 1, 2, 3

Rationale: Nonsteroidal antiinflammatory drugs (NSAIDs) can amplify the effects of anticoagulants; therefore, these medications should not be taken together. Hypoglycemia may result for the client taking ibuprofen if the client is concurrently taking an oral hypoglycemic agent such as glimepiride; these medications should not be combined. A high risk of toxicity exists if the client is taking ibuprofen concurrently with a calcium channel blocker such as amlodipine; therefore, this combination should be avoided. There is no known interaction between ibuprofen and simvastatin or hydrochlorothiazide.

Test-Taking Strategy: Note the **subject** of the question, data provided by the client necessitating contacting the HCP. Determining that ibuprofen is classified as an NSAID will help you to determine that it should not be combined with anticoagulants. Also recalling that hypoglycemia can occur as an adverse effect will help you to recall that these medications should not be combined. From the remaining options, it is necessary to remember that toxicity can result if NSAIDs are combined with calcium channel blockers.

Review: Medication interactions for **NSAIDs**, specifically **ibuprofen**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Pain

Priority Concepts: Clinical Judgment; Safety

Reference: Rosenjack Burchum, Rosenthal (2016), pp. 861, 866–868.

71. 4

Rationale: The normal reference range for the glycosylated hemoglobin A_{1c} is 4.0% to 6.0%. This test measures the amount of glucose that has become permanently bound to

the red blood cells from circulating glucose. Erythrocytes live for about 120 days, giving feedback about blood glucose for past 120 days. Elevations in the blood glucose level will cause elevations in the amount of glycosylation. Thus the test is useful in identifying clients who have periods of hyperglycemia that are undetected in other ways. The estimated average glucose for a glycosylated hemoglobin A_{1c} of 9% is 212 mg/dL (11.8 mmol/L). Elevations indicate continued need for teaching related to the prevention of hyperglycemic episodes.

Test-Taking Strategy: Focus on the **subject**, a glycosylated hemoglobin A_{1c} level of 9%. Recalling the normal value and that an elevated value indicates hyperglycemia will assist in directing you to the correct option.

Review: **Glycosylated hemoglobin A_{1c}**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Fundamentals of Care—Laboratory Values

Priority Concepts: Client Education; Glucose Regulation

72. 1

Rationale: The normal WBC count ranges from 5000–10,000 mm^3 ($5\text{--}10 \times 10^9/\text{L}$). The client who has a decrease in the number of circulating WBCs is immunosuppressed. The nurse implements neutropenic precautions when the client's values fall sufficiently below the normal level. The specific value for implementing neutropenic precautions usually is determined by agency policy. The remaining options are normal values.

Test-Taking Strategy: Focus on the **subject**, the need to implement neutropenic precautions. Recalling that the normal WBC count is 5000–10,000 mm^3 ($5\text{--}10 \times 10^9/\text{L}$) will direct you to the correct option.

Review: The normal adult **white blood cell differential count**

73. 4

Rationale: The action that the nurse should take is to draw a sample for PT and INR level to determine the client's anticoagulation status and risk for bleeding. These results will provide information as to how to best treat this client (e.g., if an antidote such as vitamin K or a blood transfusion is needed). The aPTT monitors the effects of heparin therapy.

Test-Taking Strategy: Focus on the **subject**, a client who has taken an excessive dose of warfarin. Eliminate the option with aPTT first because it is unrelated to warfarin therapy and relates to heparin therapy. Next, eliminate the options indicating to administer an antidote and to transfuse the client because these therapies would not be implemented unless the PT and INR levels were known.

Review: Care to the client receiving **warfarin** therapy

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Planning
 Content Area: Fundamentals of Care—Laboratory Values
 Priority Concepts: Clinical Judgment; Clotting
 Reference: Lewis et al. (2014), p. 627.

74. 2

Rationale: The primary concern with opioid analgesics is respiratory depression and hypotension. Based on the assessment findings, the nurse should suspect opioid overdose. The nurse should first attempt to arouse the client and then reassess the vital signs. The vital signs may begin to normalize once the client is aroused because sleep can also cause decreased heart rate, blood pressure, respiratory rate, and oxygen saturation. The nurse should also check to see how much medication has been taken via the PCA pump, and should continue to monitor the client closely to determine if further action is needed. The nurse should contact the HCP and document the findings after all data are collected, after the client is stabilized, and if an abnormality still exists after arousing the client.

Test-Taking Strategy: First, note the **strategic word**, next. **Focus on the data in the question** and **determine if an abnormality exists**. It is clear that an abnormality exists because the client is drowsy and the vital signs are outside of the normal range. Recall that attempting to arouse the client should come before further assessment of the pump. The client should always be assessed before the equipment, before contacting the HCP, and before documentation.

Review: Management of potential **opioid overdose**.

Level of Cognitive Ability: Synthesizing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Pain

Priority Concepts: Clinical Judgment; Pain

Reference: Lewis et al. (2014), p. 164.

75. 3

Rationale: The normal hemoglobin level for an adult female client is 12–16 g/dL (120–160 mmol/L). Iron deficiency

anemia can result in lower hemoglobin levels. Dehydration may increase the hemoglobin level by hemoconcentration. Heart failure and chronic obstructive pulmonary disease may increase the hemoglobin level as a result of the body's need for more oxygen-carrying capacity.

Test-Taking Strategy: Note the **strategic words**, most likely. Evaluate each of the conditions in the options in terms of their pathophysiology and whether each is likely to raise or lower the hemoglobin level. Also, note the relationship between hemoglobin level in the question and the correct option.

Review: The normal **hemoglobin** level

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Laboratory Values

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Lewis et al. (2014), pp. 628, 638.

76. 4

Rationale: A normal platelet count ranges from 150,000 to 400,000 mm³ (150 to 400 × 10⁹/L). The nurse should place the report containing the normal laboratory value in the client's medical record. A platelet count of 300,000 mm³ (300 × 10⁹/L) is not an elevated count. The count also is not low; therefore, bleeding precautions are not needed.

Test-Taking Strategy: Focus on the **subject**, a platelet count of 300,000 mm³ (300 × 10⁹/L). Remember that options that are **comparable or alike** are not likely to be correct. With this in mind, eliminate options indicating to report the abnormally low count and placing the client on bleeding precautions first. From the remaining options, recalling the normal range for this laboratory test will direct you to the correct option.

Review: The normal **platelet count**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Laboratory Values

Priority Concepts: Clinical Judgment; Clotting

Reference: Lewis et al. (2014), p. 626.

Nutrition

PRIORITY CONCEPT Health Promotion; Nutrition

CRITICAL THINKING What Should You Do?

A client has been placed on a fluid restriction due to acute kidney injury. The client complains of thirst and asks what can be done to relieve this discomfort. What measures should the nurse tell the client to take to relieve thirst while adhering to the fluid restriction?

Answer located on p. 130.

I. Nutrients

A. Carbohydrates

1. Carbohydrates are the preferred source of energy.
2. Sugars, starches, and cellulose provide 4 cal/g.
3. Carbohydrates promote normal fat metabolism, spare protein, and enhance lower gastrointestinal function.
4. Major food sources of carbohydrates include milk, grains, fruits, and vegetables.
5. Inadequate carbohydrate intake affects metabolism.

B. Fats

1. Fats provide a concentrated source and a stored form of energy.
2. Fats protect internal organs and maintain body temperature.
3. Fats enhance absorption of the fat-soluble vitamins.
4. Fats provide 9 cal/g.
5. Inadequate intake of essential fatty acids leads to clinical manifestations of sensitivity to cold, skin lesions, increased risk of infection, and amenorrhea in women.
6. Diets high in fat can lead to obesity and increase the risk of cardiovascular disease and some cancers.

C. Proteins

1. Amino acids, which make up proteins, are critical to all aspects of growth and development of body tissues, and provide 4 cal/g.

2. Proteins build and repair body tissues, regulate fluid balance, maintain acid-base balance, produce antibodies, provide energy, and produce enzymes and hormones.
3. Essential amino acids are required in the diet because the body cannot manufacture them.
4. Complete proteins contain all essential amino acids; incomplete proteins lack some of the essential fatty acids.
5. Inadequate protein can cause protein energy malnutrition and severe wasting of fat and muscle tissue.

! Major stages of the lifespan with specific nutritional needs are pregnancy, lactation, infancy, childhood, and adolescence. Adults and older adults may experience physiological aging changes, which influence individual nutritional needs.

D. Vitamins (Box 11-1)

1. Vitamins facilitate metabolism of proteins, fats, and carbohydrates and act as catalysts for metabolic functions.
2. Vitamins promote life and growth processes, and maintain and regulate body functions.
3. Fat-soluble vitamins A, D, E, and K can be stored in the body, so an excess can cause toxicity.
4. The B vitamins and vitamin C are water-soluble vitamins, are not stored in the body, and can be excreted in the urine.

E. Minerals (Box 11-2)

1. Minerals are components of hormones, cells, tissues, and bones.
2. Minerals act as catalysts for chemical reactions and enhancers of cell function.
3. Almost all foods contain some form of minerals.
4. A deficiency of minerals can develop in chronically ill or hospitalized clients.
5. Electrolytes play a major role in osmolality and body water regulation, acid-base balance, enzyme reactions, and neuromuscular activity (see Chapter 8 for additional information regarding electrolytes).

BOX 11-1 Food Sources of Vitamins**Water-Soluble Vitamins**

Folic acid: Green leafy vegetables; liver, beef, and fish; legumes; grapefruit and oranges

Niacin: Meats, poultry, fish, beans, peanuts, grains

Vitamin B₁ (thiamine): Pork and nuts, whole-grain cereals, and legumes

Vitamin B₂ (riboflavin): Milk, lean meats, fish, grains

Vitamin B₆ (pyridoxine): Yeast, corn, meat, poultry, fish

Vitamin B₁₂ (cobalamin): Meat, liver

Vitamin C (ascorbic acid): Citrus fruits, tomatoes, broccoli, cabbage

Fat-Soluble Vitamins

Vitamin A: Liver, egg yolk, whole milk, green or orange vegetables, fruits

Vitamin D: Fortified milk, fish oils, cereals

Vitamin E: Vegetable oils; green leafy vegetables; cereals; apricots, apples, and peaches

Vitamin K: Green leafy vegetables; cauliflower and cabbage

BOX 11-2 Food Sources of Minerals**Calcium**

Cheese
Collard greens
Milk and soy milk
Rhubarb
Sardines
Tofu
Yogurt

Chloride

Salt

Iron

Breads and cereals
Dark green vegetables
Dried fruits
Egg yolk
Legumes
Liver
Meats

Magnesium

Avocado
Canned white tuna
Cauliflower
Cooked rolled oats
Green leafy vegetables
Milk
Peanut butter
Peas
Pork, beef, chicken
Potatoes
Raisins
Yogurt

Phosphorus

Fish
Nuts
Organ meats
Pork, beef, chicken
Whole-grain breads and cereals

Potassium

Avocado
Bananas
Cantaloupe
Carrots
Fish
Mushrooms
Oranges
Pork, beef, veal
Potatoes
Raisins
Spinach
Strawberries
Tomatoes

Sodium

Bacon
Butter
Canned food
Cheese
Cured pork
Hot dogs
Ketchup
Lunch meat
Milk
Mustard
Processed food
Snack food
Soy sauce
Table salt
White and whole-wheat bread

Zinc

Eggs
Leafy vegetables
Meats
Protein-rich foods

! Always assess the client's ability to eat and swallow and promote independence in eating as much as is possible.

II. MyPlate (Fig. 11-1)

- A. Provides a description of a balanced diet that includes grains, vegetables, fruits, dairy products, and protein foods (see <http://www.choosemyplate.gov/>)
- B. A nutritionist should be consulted for individualized dietary recommendations.
- C. Guidelines
 1. Avoid eating oversized portions of foods.
 2. Fill half of the plate with fruits and vegetables.
 3. Vary the type of vegetables and fruits eaten.
 4. Select at least half of the grains as whole grains.
 5. Ensure that foods from the dairy group are high in calcium.
 6. Drink milk that is fat-free or low fat (1%).

FIGURE 11-1 MyPlate. (From U.S. Department of Agriculture. Available at <http://www.choosemyplate.gov/>.)

7. Eat protein foods that are lean.
8. Select fresh foods over frozen or canned foods.
9. Drink water rather than liquids that contain sugar.

 Always consider the client's cultural and personal choices when planning nutritional intake.

III. Therapeutic Diets

A. Clear liquid diet

1. Indications
 - a. Clear liquid diet provides fluids and some electrolytes to prevent dehydration.
 - b. Clear liquid diet is used as an initial feeding after complete bowel rest.
 - c. Clear liquid diet is used initially to feed a malnourished person or a person who has not had any oral intake for some time.
 - d. Clear liquid diet is used for bowel preparation for surgery or diagnostic tests, as well as postoperatively and in clients with fever, vomiting, or diarrhea.
 - e. Clear liquid diet is used in gastroenteritis.
2. Nursing considerations
 - a. Clear liquid diet is deficient in energy (calories) and many nutrients.
 - b. Clear liquid diet is easily digested and absorbed.
 - c. Minimal residue is left in the gastrointestinal tract.
 - d. Clients may find a clear liquid diet unappetizing and boring.
 - e. As a transition diet, clear liquids are intended for short-term use.
 - f. Clear liquids and foods that are relatively transparent to light and are liquid at body temperature are considered “clear liquids,” such as water, bouillon, clear broth, carbonated beverages, gelatin, hard candy, lemonade, ice pops, and regular or decaffeinated coffee or tea.
 - g. By limiting caffeine intake, an upset stomach and sleeplessness may be prevented.
 - h. The client may consume salt and sugar.
 - i. Dairy products and fruit juices with pulp are not clear liquids.

 Monitor the client's hydration status by assessing intake and output, assessing weight, monitoring for edema, and monitoring for signs of dehydration. Each kilogram (2.2 lb) of weight gained or lost is equal to 1 liter of fluid retained or lost.

B. Full liquid diet

1. Indication: May be used as a transition diet after clear liquids following surgery or for clients who have difficulty chewing, swallowing, or tolerating solid foods

2. Nursing considerations

- a. A full liquid diet is nutritionally deficient in energy (calories) and many nutrients.
- b. The diet includes clear and opaque liquid foods, and those that are liquid at body temperature.
- c. Foods include all clear liquids and items such as plain ice cream, sherbet, breakfast drinks, milk, pudding and custard, soups that are strained, refined cooked cereals, fruit juices, and strained vegetable juices.
- d. Use of a complete nutritional liquid supplement is often necessary to meet nutrient needs for clients on a full liquid diet for more than 3 days.

 Provide nutritional supplements such as those high in protein, as prescribed, for the client on a liquid diet.

C. Mechanical soft diet

1. Indications
 - a. Provides foods that have been mechanically altered in texture to require minimal chewing
 - b. Used for clients who have difficulty chewing but can tolerate more variety in texture than a liquid diet offers
 - c. Used for clients who have dental problems, surgery of the head or neck, or dysphagia (requires swallowing evaluation and may require thickened liquids if the client has swallowing difficulties)
2. Nursing considerations
 - a. Degree of texture modification depends on individual need, including pureed, mashed, ground, or chopped.
 - b. Foods to be avoided in mechanically altered diets include nuts; dried fruits; raw fruits and vegetables; fried foods; tough, smoked, or salted meats; and foods with coarse textures.

D. Soft diet

1. Indications
 - a. Used for clients who have difficulty chewing or swallowing
 - b. Used for clients who have ulcerations of the mouth or gums, oral surgery, broken jaw, plastic surgery of the head or neck, or dysphagia, or for the client who has had a stroke
2. Nursing considerations
 - a. Clients with mouth sores should be served foods at cooler temperatures.
 - b. Clients who have difficulty chewing and swallowing because of dry mouth can increase salivary flow by sucking on sour candy.
 - c. Encourage the client to eat a variety of foods.
 - d. Provide plenty of fluids with meals to ease chewing and swallowing of foods.
 - e. Drinking fluids through a straw may be easier than drinking from a cup or glass; a straw may

not be allowed for clients with dysphagia (because of the risk of aspiration).

- f. All foods and seasonings are permitted; however, liquid, chopped, or pureed foods or regular foods with a soft consistency are tolerated best.
- g. Foods that contain nuts or seeds, which easily can become trapped in the mouth and cause discomfort, should be avoided.
- h. Raw fruits and vegetables, fried foods, and whole grains should be avoided.

 **Consider the client's disease or illness and how it may affect nutritional status.**

E. Low-fiber (low-residue) diet

1. Indications

- a. Supplies foods that are least likely to form an obstruction when the intestinal tract is narrowed by inflammation or scarring or when gastrointestinal motility is slowed
- b. Used for inflammatory bowel disease, partial obstructions of the intestinal tract, gastroenteritis, diarrhea, or other gastrointestinal disorders

2. Nursing considerations

- a. Foods that are low in fiber include white bread, refined cooked cereals, cooked potatoes without skins, white rice, and refined pasta.
- b. Foods to limit or avoid are raw fruits (except bananas), vegetables, nuts and seeds, plant fiber, and whole grains.
- c. Dairy products should be limited to 2 servings a day.

F. High-fiber (high-residue) diet

1. Indication: Used for constipation, irritable bowel syndrome when the primary symptom is alternating constipation and diarrhea, and asymptomatic diverticular disease

2. Nursing considerations

- a. High-fiber diet provides 20 to 35 g of dietary fiber daily.
- b. Volume and weight are added to the stool, speeding the movement of undigested materials through the intestine.
- c. High-fiber foods are fruits and vegetables and whole-grain products.
- d. Increase fiber gradually and provide adequate fluids to reduce possible undesirable side effects such as abdominal cramps, bloating, diarrhea, and dehydration.
- e. Gas-forming foods should be limited ([Box 11-3](#)).

G. Cardiac diet ([Box 11-4](#))

1. Indications

- a. Indicated for atherosclerosis, diabetes mellitus, hyperlipidemia, hypertension, myocardial infarction, nephrotic syndrome, and renal failure

BOX 11-3 Gas-Forming Foods

Apples	Melons
Artichokes	Milk
Barley	Molasses
Beans	Nuts
Bran	Onions
Broccoli	Radishes
Brussels sprouts	Soybeans
Cabbage	Wheat
Celery	Yeast
Figs	

BOX 11-4 Sodium-Free Spices and Flavorings

Allspice	Ginger
Almond extract	Lemon extract
Bay leaves	Maple extract
Caraway seeds	Marjoram
Cinnamon	Mustard powder
Curry powder	Nutmeg
Garlic powder or garlic	

- b. Reduces the risk of heart disease

- c. Dietary Approaches to Stop Hypertension (DASH) diet: recommended to prevent and control hypertension, hypercholesterolemia, and obesity

- d. The DASH diet includes fruits, vegetables, whole grains, and low-fat dairy foods; meat, fish, poultry, nuts, and beans; and is limited in sugar-sweetened foods and beverages, red meat, and added fats.

2. Nursing considerations

- a. Restrict total amounts of fat, including saturated, trans, polyunsaturated, and monounsaturated; cholesterol; and **sodium**.

- b. Teach the client about the DASH diet or other prescribed diet.

H. Fat-restricted diet

1. Indications

- a. Used to reduce symptoms of abdominal pain, steatorrhea, flatulence, and diarrhea associated with high intakes of dietary fat, and to decrease nutrient losses caused by ingestion of dietary fat in individuals with malabsorption disorders

- b. Used for clients with malabsorption disorders, pancreatitis, gallbladder disease, and gastroesophageal reflux

2. Nursing considerations

- a. Restrict total amount of fat, including saturated, trans, polyunsaturated, and monounsaturated.

- b. Clients with malabsorption may also have difficulty tolerating fiber and lactose.

- c. Vitamin and mineral deficiencies may occur in clients with diarrhea or steatorrhea.
 - d. A fecal fat test may be prescribed and indicates fat malabsorption with excretion of more than 6 to 8 g of fat (or more than 10% of fat consumed) per day during the 3 days of specimen collection.
- I. High-calorie, high-protein diet
1. Indication: Used for severe stress, burns, wound healing, cancer, human immunodeficiency virus, acquired immunodeficiency syndrome, chronic obstructive pulmonary disease, respiratory failure, or any other type of debilitating disease
 2. Nursing considerations
 - a. Encourage nutrient-dense, high-calorie, high-protein foods such as whole milk and milk products, peanut butter, nuts and seeds, beef, chicken, fish, pork, and eggs.
 - b. Encourage snacks between meals, such as milkshakes, instant breakfasts, and nutritional supplements.
-  **Calorie counts assist in determining the client's total nutritional intake and can identify a deficit or excess intake.**
- J. Carbohydrate-consistent diet
1. Indication: Used for clients with diabetes mellitus, hypoglycemia, hyperglycemia, and obesity
 2. Nursing considerations
 - a. The Exchange System for Meal Planning, developed by the Academy of Nutrition and Dietetics and the American Diabetes Association, is a food guide that may be recommended.
 - b. The Exchange System groups foods according to the amounts of carbohydrates, fats, and proteins they contain; major food groups include the carbohydrate, meat and meat substitute, and fat groups.
 - c. A carbohydrate consistent diet focuses on maintaining a consistent amount of carbohydrate intake each day and with each meal; also known as “carb counting.” For additional information, refer to: <http://www.livestrong.com/article/436101-the-consistent-carbohydrate-diet-for-diabetics/>
 - d. The MyPlate diet may also be recommended.
- K. Sodium-restricted diet (see [Box 11-4](#))
1. Indication: Used for hypertension, heart failure, renal disease, cardiac disease, and liver disease
 2. Nursing considerations
 - a. Individualized; can include 4 g of sodium daily (no-added-salt diet), 2 to 3 g of sodium daily (moderate restriction), 1 g of sodium daily (strict restriction), or 500 mg of sodium daily (severe restriction and seldom prescribed)
 - b. Encourage intake of fresh foods, rather than processed foods, which contain higher amounts of sodium.
 - c. Canned, frozen, instant, smoked, pickled, and boxed foods usually contain higher amounts of sodium. Lunch meats, soy sauce, salad dressings, fast foods, soups, and snacks such as potato chips and pretzels also contain large amounts of sodium; teach patients to read nutritional facts on product packaging regarding sodium content per serving.
 - d. Certain medications contain significant amounts of sodium.
 - e. Salt substitutes may be used to improve palatability; most salt substitutes contain large amounts of **potassium** and should not be used by clients with renal disease.
- L. Protein-restricted diet
1. Indication: Used for renal disease and end-stage liver disease
 2. The nutritional status of critically ill clients with protein-losing renal diseases, malabsorption syndromes, and continuous renal replacement therapy or dialysis should have their protein needs assessed by estimating the protein equivalent of nitrogen appearance (PNA); a nutritionist should be consulted.
 3. Nursing considerations
 - a. Provide enough protein to maintain nutritional status but not an amount that will allow the buildup of waste products from protein metabolism (40 to 60 g of protein daily).
 - b. The less protein allowed, the more important it becomes that all protein in the diet be of high biological value (contain all essential amino acids in recommended proportions).
 - c. An adequate total energy intake from foods is critical for clients on protein-restricted diets (protein will be used for energy, rather than for protein synthesis).
 - d. Special low-protein products, such as pastas, bread, cookies, wafers, and gelatin made with wheat starch, can improve energy intake and add variety to the diet.
 - e. Carbohydrates in powdered or liquid forms can provide additional energy.
 - f. Vegetables and fruits contain some protein and, for very low-protein diets, these foods must be calculated into the diet.
 - g. Foods are limited from the milk, meat, bread, and starch groups.
- M. Gluten-free diet: A treatment for celiac disease and gluten sensitivity for clients needing the protein fraction “gluten” eliminated from their diet. See Chapter 37 for information on this diet.

 Fluid restrictions may be prescribed for clients with hyponatremia, severe extracellular cellular volume excess, and renal disorders. Ask specifically about client preferences regarding types of oral fluids and temperature preference of fluids.

N. Renal diet (see Box 11-2)

1. Indication: Used for the client with acute kidney injury or chronic kidney disease and those requiring hemodialysis or peritoneal dialysis
2. Nursing considerations
 - a. Controlled amounts of protein, sodium, phosphorus, calcium, potassium, and fluids may be prescribed; may also need modification in fiber, cholesterol, and fat based on individual requirements; clients on peritoneal dialysis usually have diets prescribed that are less restrictive with fluid and protein intake than those on hemodialysis.
 - b. Most clients receiving dialysis need to restrict fluids (Box 11-5).
 - c. Monitor weight daily as a priority because weight is an important indicator of fluid status.

 An initial assessment includes identifying allergies and food and medication interactions.

O. Potassium-modified diet (see Box 11-2)

1. Indications
 - a. Low-potassium diet is indicated for hyperkalemia, which may be caused by impaired renal function, hypoaldosteronism, Addison's disease, angiotensin-converting enzyme inhibitor medications, immunosuppressive medications, potassium-retaining diuretics, and chronic hyperkalemia.
 - b. High-potassium diet is indicated for hypokalemia, which may be caused by renal tubular acidosis, gastrointestinal losses (diarrhea, vomiting), intracellular shifts, potassium-losing diuretics, antibiotics, mineralocorticoid or glucocorticoid excess resulting from primary or secondary aldosteronism, Cushing's syndrome, or exogenous corticosteroid use.
2. Nursing considerations
 - a. Foods that are low in potassium include applesauce, green beans, cabbage, lettuce, peppers, grapes, blueberries, cooked summer

squash, cooked turnip greens, pineapple, and raspberries.

- b. Box 11-2 lists foods that are high in potassium.

P. High-calcium diet

1. Indication: Calcium is needed during bone growth and in adulthood to prevent osteoporosis and to facilitate vascular contraction, vasodilation, muscle contraction, and nerve transmission.
2. Nursing considerations
 - a. Primary dietary sources of calcium are dairy products (see Box 11-2 for food items high in calcium).
 - b. Lactose-intolerant clients should incorporate nondairy sources of calcium into their diet regularly.

Q. Low-purine diet

1. Indication: Used for gout, kidney stones, and elevated uric acid levels
2. Nursing considerations
 - a. Purine is a precursor for uric acid, which forms stones and crystals.
 - b. Foods to restrict include anchovies, herring, mackerel, sardines, scallops, organ meats, gravies, meat extracts, wild game, goose, and sweetbreads.

R. High-iron diet

1. Indication: Used for clients with anemia
2. Nursing considerations
 - a. The high-iron diet replaces iron deficit from inadequate intake or loss.
 - b. The diet includes organ meats, meat, egg yolks, whole-wheat products, dark green leafy vegetables, dried fruit, and legumes.
 - c. Inform the client that concurrent intake of Vitamin C with iron foods enhances absorption of iron.

IV. Vegan and Vegetarian Diets

A. Vegan

1. Vegans follow a strict vegetarian diet and consume no animal foods.
2. Eat only foods of plant origin (e.g., whole or enriched grains, legumes, nuts, seeds, fruits, vegetables).
3. The use of soybeans, soy milk, soybean curd (tofu), and processed soy protein products enhance the nutritional value of the diet.

B. Lacto-vegetarian

1. Lacto-vegetarians eat milk, cheese, and dairy foods but avoid meat, fish, poultry, and eggs.
2. A diet of whole or enriched grains, legumes, nuts, seeds, fruits, and vegetables in sufficient quantities to meet energy needs provides a balanced diet.

BOX 11-5 Measures to Relieve Thirst

- Chew gum or suck hard candy.
- Freeze fluids so they take longer to consume.
- Add lemon juice to water to make it more refreshing.
- Gargle with refrigerated mouthwash.

- C. Lacto-ovo-vegetarian
1. Lacto-ovo-vegetarians follow a food pattern that allows for the consumption of dairy products and eggs.
 2. Consumption of adequate plant and animal food sources that excludes meat, poultry, pork, and fish poses no nutritional risks.
- D. Ovo-vegetarians: The only animal foods that the ovo-vegetarian consumes are eggs, which are an excellent source of complete proteins.
- E. Nursing considerations
1. Vegan and vegetarian diets are not usually prescribed but are a diet choice made by a client.
 2. Ensure that the client eats a sufficient amount of varied foods to meet nutrient and energy needs.
 3. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
 4. Potential deficiencies in vegetarian diets include energy, protein, vitamin B₁₂, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
 5. To enhance absorption of iron, vegetarians should consume a good source of iron and vitamin C with each meal.
 6. Foods eaten may include tofu, tempeh, soy milk and soy products, meat analogs, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.
 7. Soy protein is considered equivalent in quality to animal protein.

! Body mass index (BMI) can be calculated by dividing the client's weight in kilograms by height in meters squared. For example, a client who weighs 75 kg (165 pounds) and is 1.8 m (5 feet, 9 inches) tall has a BMI of 23.15 (75 divided by 1.8² = 23.15). From: Potter et al. (2013), p. 1008.

V. Enteral Nutrition

- A. Description: Provides liquefied foods into the gastrointestinal tract via a tube
- B. Indications
1. When the gastrointestinal tract is functional but oral intake is not meeting estimated nutrient needs
 2. Used for clients with swallowing problems, burns, major trauma, liver or other organ failure, or severe malnutrition
- C. Nursing considerations
1. Clients with lactose intolerance need to be placed on lactose-free formulas.
 2. See Chapter 20 for information regarding the administration of gastrointestinal tube feedings and associated complications.

CRITICAL THINKING What Should You Do?

Answer: The client with acute kidney injury may be placed on fluid restriction because of decreased renal function and glomerular filtration rate, resulting in fluid volume excess. To allow the kidneys to rest, decreased fluid consumption may be indicated. When a client is placed on this restriction, increased thirst may be a problem. The nurse should instruct the client in measures to relieve thirst in order to promote adherence to the fluid restriction. These measures include chewing gum or sucking hard candy, freezing fluids so they take longer to consume, adding lemon juice to water to make it more refreshing, and gargling with refrigerated mouthwash.

References: Lewis et al. (2014), p. 1115; Potter et al. (2013), p. 904.

PRACTICE QUESTIONS

77. The nurse is teaching a client who has iron deficiency anemia about foods she should include in the diet. The nurse determines that the client understands the dietary modifications if which items are selected from the menu?
1. Nuts and milk
 2. Coffee and tea
 3. Cooked rolled oats and fish
 4. Oranges and dark green leafy vegetables
78. The nurse is planning to teach a client with malabsorption syndrome about the necessity of following a low-fat diet. The nurse develops a list of high-fat foods to avoid and should include which food items on the list? Select all that apply.
- 1. Oranges
 - 2. Broccoli
 - 3. Margarine
 - 4. Cream cheese
 - 5. Luncheon meats
 - 6. Broiled haddock
79. The nurse instructs a client with chronic kidney disease who is receiving hemodialysis about dietary modifications. The nurse determines that the client understands these dietary modifications if the client selects which items from the dietary menu?
1. Cream of wheat, blueberries, coffee
 2. Sausage and eggs, banana, orange juice
 3. Bacon, cantaloupe melon, tomato juice
 4. Cured pork, grits, strawberries, orange juice
80. The nurse is conducting a dietary assessment on a client who is on a vegan diet. The nurse provides dietary teaching and should focus on foods high in which vitamin that may be lacking in a vegan diet?

1. Vitamin A
 2. Vitamin B₁₂
 3. Vitamin C
 4. Vitamin E
81. A client with hypertension has been told to maintain a diet low in sodium. The nurse who is teaching this client about foods that are allowed should include which food item in a list provided to the client?
1. Tomato soup
 2. Boiled shrimp
 3. Instant oatmeal
 4. Summer squash
- ❖ 82. A postoperative client has been placed on a clear liquid diet. The nurse should provide the client with which items that are allowed to be consumed on this diet? Select all that apply.
- 1. Broth
 - 2. Coffee
 - 3. Gelatin
 - 4. Pudding
 - 5. Vegetable juice
 - 6. Pureed vegetables
83. The nurse is instructing a client with hypertension on the importance of choosing foods low in sodium. The nurse should teach the client to limit intake of which food?
1. Apples
 2. Bananas
 3. Smoked sausage
 4. Steamed vegetables
84. A client who is recovering from surgery has been advanced from a clear liquid diet to a full liquid diet. The client is looking forward to the diet change because he has been “bored” with the clear liquid diet. The nurse should offer which full liquid item to the client?
1. Tea
 2. Gelatin
 3. Custard
 4. Ice pop
85. A client is recovering from abdominal surgery and has a large abdominal wound. The nurse should encourage the client to eat which food item that is naturally high in vitamin C to promote wound healing?
1. Milk
 2. Oranges
 3. Bananas
 4. Chicken
86. The nurse is caring for a client with cirrhosis of the liver. To minimize the effects of the disorder, the nurse teaches the client about foods that are high in thiamine. The nurse determines that the client has the best understanding of the dietary measures to follow if the client states an intention to increase the intake of which food?
1. Milk
 2. Chicken
 3. Broccoli
 4. Legumes

ANSWERS

77. 4

Rationale: Dark green leafy vegetables are a good source of iron and oranges are a good source of vitamin C, which enhances iron absorption. All other options are not food sources that are high in iron and vitamin C.

Test-Taking Strategy: Focus on the **subject**, diet choices for a client with anemia. Think about the pathophysiology of anemia and determine that the client needs foods high in iron and recall that vitamin C enhances iron absorption. Use knowledge of foods high in iron and vitamin C. Remember that green leafy vegetables are high in iron and oranges are high in vitamin C.

Review: Food sources of **vitamin C** and **iron**

❖ 78. 3, 4, 5

Rationale: Fruits and vegetables tend to be lower in fat because they do not come from animal sources. Broiled haddock is also naturally lower in fat. Margarine, cream cheese, and luncheon meats are high-fat foods.

Test-Taking Strategy: Focus on the **subject** of the question, the high-fat foods. Oranges and broccoli (fruit and vegetable) can be eliminated first. Next eliminate haddock because it is a broiled food. Remember that margarine, cheese, and luncheon meats are high in fat content.

Review: **High-fat foods**

79. 1

Rationale: The diet for a client with chronic kidney disease who is receiving hemodialysis should include controlled amounts of sodium, phosphorus, calcium, potassium, and fluids, which

is indicated in the correct option. The food items in the remaining options are high in sodium, phosphorus, or potassium.

Test-Taking Strategy: Focus on the **subject**, dietary modification for a client with chronic kidney disease. Think about the pathophysiology of this disorder to recall that sodium needs to be limited. Noting the items sausage, bacon, and cured pork will assist in eliminating these options.

Review: **Dietary guidelines** for the client with **chronic kidney disease**

80. 2

Rationale: Vegans do not consume any animal products. Vitamin B₁₂ is found in animal products and therefore would most likely be lacking in a vegan diet. Vitamins A, C, and E are found in fresh fruits and vegetables, which are consumed in a vegan diet.

Test-Taking Strategy: Focus on the **subject**, a vegan diet and the vitamin lacking in this diet. Recalling the food items eaten and restricted in this diet will direct you to the correct option. Remember that vegans do not consume any animal products and as a result may be deficient in vitamin B₁₂.

Review: The **vegan diet** and sources of **vitamins**

81. 4

Rationale: Foods that are lower in sodium include fruits and vegetables (summer squash), because they do not contain physiological saline. Highly processed or refined foods (tomato soup, instant oatmeal) are higher in sodium unless their food labels specifically state “low sodium.” Saltwater fish and shellfish are high in sodium.

Test-Taking Strategy: Focus on the **subject**, foods low in sodium. Begin to answer this question by eliminating boiled shrimp, recalling that saltwater fish and shellfish are high in sodium. Next, eliminate tomato soup and instant oatmeal because they are processed foods.

Review: Foods high in **sodium**

Parenteral Nutrition

PRIORITY CONCEPTS Fluids and Electrolytes; Nutrition

CRITICAL THINKING What Should You Do?

A client has a triple-lumen central venous catheter that is being used for the administration of parenteral nutrition, medications, and laboratory draws. The nurse is preparing to administer medication through the catheter, and the port being used for medication administration is sluggish and not flushing properly. What should the nurse do?

Answer located on p. 138.

I. Parenteral Nutrition (PN)

A. Description

1. Parenteral nutrition (also termed hyperalimentation) supplies nutrients via the veins.
2. PN consists of both **partial parenteral nutrition** (PPN) and **total parenteral nutrition** (TPN). The indication of the type used depends on the client's nutritional needs.
3. PN supplies carbohydrates in the form of dextrose, fats in an emulsified form, proteins in the form of amino acids, vitamins, minerals, electrolytes, and water.
4. PN prevents subcutaneous fat and muscle protein from being catabolized by the body for energy.
5. PN solutions are hypertonic due to the higher concentrations of glucose and addition of amino acids.

B. Indications

1. Clients with severely dysfunctional or nonfunctional gastrointestinal tracts who are unable to process nutrients may benefit from PN.
2. Clients who can take some oral nutrition, but not enough to meet their nutrient requirements, may benefit from PN.
3. Clients with multiple gastrointestinal surgeries, gastrointestinal trauma, severe intolerance to enteral feedings, or intestinal obstructions, or who need to rest the bowel for healing, may benefit from PN.

4. Clients with severe nutritionally deficient conditions such as acquired immunodeficiency syndrome, cancer, burn injuries, or **malnutrition**, or clients receiving chemotherapy, may benefit from PN.

! PN is a form of nutrition and is used when there is no other nutritional alternative. Administering nutrition orally or through a nasogastric tube is usually initiated first, before PN is initiated.

C. Administration of PN (Fig. 12-1)

1. Partial parenteral nutrition

- a. PPN: Usually administered through a large distal vein in the arm with a standard peripheral intravenous (IV) catheter or midline or through a peripherally inserted central catheter (PICC). A midline is placed in an upper arm vein such as the brachial or cephalic vein with the tip ending below the level of the axillary line.
- b. If a PICC cannot be established, the subclavian vein or internal or external jugular veins can be used for PPN.

2. TPN: Administered through a central vein; the use of a PICC is acceptable. Other sites that can be used include the subclavian vein and the internal or external jugular veins.

3. If the bag of intravenous solution is empty and the nurse is waiting for the delivery of a new bag of solution from the pharmacy, a 10% dextrose in water solution should be infused at prescribed rate to prevent hypoglycemia; the prescribed solution should be obtained as soon as possible.

! The delivery of hypertonic solutions into peripheral veins can cause sclerosis, phlebitis, or swelling. Monitor closely for these complications.

II. Components of Parenteral Nutrition

A. Carbohydrates

1. The strength of the dextrose solution depends on the client's nutritional needs, the route of

FIGURE 12-1 A, Placement of peripherally inserted central catheter through antecubital fossa. B, Placement of central venous catheter inserted into subclavian vein. IV, Intravenous; PICC, peripherally inserted central catheter.

administration (central or peripheral), and agency protocols.

2. Carbohydrates typically provide 60% to 70% of calorie (energy) needs.

B. Amino acids (protein)

1. Concentrations range from 3.5% to 20%; lower concentrations are most commonly used for peripheral vein administration and higher concentrations are most often administered through a central vein.
2. About 15% to 20% of total energy needs should come from protein.

C. Fat emulsion (lipids)

1. Lipids provide up to 30% of calorie (energy) needs.
2. Lipids provide nonprotein calories and prevent or correct fatty acid deficiency.
3. Lipid solutions are isotonic and therefore can be administered through a peripheral or central vein; the solution may be administered through a separate IV line below the filter of the main IV administration set by a Y-connector or as an admixture to the PN solution (3-in-1 admixture consisting of dextrose, amino acids, and lipids).
4. Most fat emulsions are prepared from soybean or safflower oil, with egg yolk to provide emulsification; the primary components are linoleic, oleic, palmitic, linolenic, and stearic acids (assess the client for allergies).
5. Glucose-intolerant clients or clients with diabetes mellitus may benefit from receiving a larger percentage of their PN from lipids, which helps to control blood glucose levels and lower insulin requirements caused by infused dextrose.
6. Examine the bottle for separation of emulsion into layers or fat globules or for the accumulation of froth; if observed, do not use and return the solution to the pharmacy.
7. Additives should not be put into the fat emulsion solution.

8. Follow agency policy regarding the filter size that should be used; usually a 1.2- μm filter or larger should be used because the lipid particles are too large to pass through a 0.22- μm filter.
9. Infuse solution at the flow rate prescribed—usually slowly at 1 mL/minute initially—monitor vital signs every 10 minutes, and observe for adverse reactions for the first 30 minutes of the infusion. If signs of an adverse reaction occur, stop the infusion and notify the health care provider (HCP) (Box 12-1).
10. If no adverse reaction occurs, adjust the flow rate to the prescribed rate.
11. Monitor serum lipids 4 hours after discontinuing the infusion.

! Fat emulsions (lipids) contain egg yolk phospholipids and should not be given to clients with egg allergies.

D. Vitamins

1. PN solutions usually contain a standard multivitamin preparation to meet most vitamin needs and prevent deficiencies.
2. Individual vitamin preparations can be added, as needed and as prescribed.

E. Minerals and trace elements: Commercial mineral and trace element preparations are available in various concentrations to promote normal **metabolism**.

BOX 12-1 Signs and Symptoms of an Adverse Reaction to Lipids

- | | |
|-----------------------|--------------------------|
| ▪ Chest and back pain | ▪ Flushing |
| ▪ Chills | ▪ Headache |
| ▪ Cyanosis | ▪ Nausea and vomiting |
| ▪ Diaphoresis | ▪ Pressure over the eyes |
| ▪ Dyspnea | ▪ Thrombophlebitis |
| ▪ Fever | ▪ Vertigo |

- F. Electrolytes: Electrolyte requirements for individuals receiving PN therapy vary, depending on body weight, presence of malnutrition or catabolism, degree of electrolyte depletion, changes in organ function, ongoing electrolyte losses, and the disease process.
- G. Water: The amount of water needed in a PN solution is determined by electrolyte balance and fluid requirements.
- H. Regular insulin: May be added to control the blood glucose level because of the high concentration of glucose in the PN solution.
- I. Heparin: May be added to reduce the buildup of a fibrinous clot at the catheter tip.

III. Administration and Discontinuation

A. Types of administration

1. Continuous PN
 - a. Infused continuously over 24 hours
 - b. Most commonly used in a hospital setting
2. Intermittent or cyclic PN
 - a. In general, the nutrient solution infusion regimen varies and is commonly administered overnight.
 - b. Allows clients requiring PN on a long-term basis to participate in activities of daily living during the day without the inconvenience of an IV bag and pump set
 - c. Monitor glucose levels closely because of the risk of hypoglycemia due to lack of glucose during non-infusion times.

B. Discontinuing PN therapy

1. Evaluation of nutritional status by a nutritionist or pharmacist is done before PN is discontinued.
2. If discontinuation is prescribed, gradually decrease the flow rate for 1 to 2 hours while increasing oral intake (this assists in preventing hypoglycemia).
3. After removal of the IV catheter, change the dressing daily until the insertion site heals. Note that central lines should not be left in without a reason due to risk of infection, but in some situations are left in place and used for other necessary reason (venous access, medication administration).
4. Encourage oral nutrition.
5. Record oral intake, body weight, and laboratory results of serum electrolyte and glucose levels.

 **Abrupt discontinuation of a PN solution can result in hypoglycemia. The flow rate should be decreased gradually when the PN is discontinued.**

IV. Complications (Table 12-1)

- A. Pneumothorax and **air embolism** are associated with central line placement; air embolism is also associated with tubing changes.

- B. Other complications include infection (catheter-related), hypervolemia, and metabolic alterations such as hyperglycemia and hypoglycemia; these complications are usually caused by the PN solution itself (see **Priority Nursing Actions**).

PRIORITY NURSING ACTIONS

Central Venous Catheter Site with a Suspected Infection

1. Notify the health care provider (HCP).
2. Prepare to remove the catheter and for possible restart at a different location.
3. Remove the tip of the catheter and send it to the laboratory for culture if prescribed by the HCP.
4. Prepare the client for obtaining blood cultures.
5. Prepare for antibiotic administration.
6. Document the occurrence, the actions taken, and the client's response.

Signs of infection at the catheter site include redness or drainage. The client will also exhibit chills, fever, and an elevated white blood cell count. If the nurse suspects infection, the HCP is notified because of the risk for sepsis. The catheter is removed and the client is prepared for a possible restart at a different location as prescribed. A central line may be removed by a nurse who has been trained in approved protocol to remove a central line. If requested, the catheter tip may be sent to the laboratory for culture to identify the bacteria present so that the effective antibiotic is prescribed. Intravenous (IV) antibiotics may be prescribed and an IV site will be needed for administration. Blood cultures are also performed to determine the presence of bacteria in the blood. Antibiotics are not started until blood cultures are obtained; otherwise the results of the cultures may not be accurate. Finally, the nurse documents the occurrence, actions taken, and the client's response. Additionally, per agency protocol, pictures of the infected catheter site may be taken and added to the documentation.

References

Lewis et al. (2014), p. 311; Perry, Potter, Ostendorf (2014), pp. 798, 801.

V. Additional Nursing Considerations

- A. Check the PN solution with the HCP's prescription to ensure that the prescribed components are contained in the solution; some health care agencies require validation of the prescription by 2 registered nurses.
- B. To prevent infection and solution incompatibility, IV medications and blood are not given through the PN line.
- C. Blood for testing may be drawn from the central venous access site; a port other than the port used to infuse the PN is used for blood draws after the PN has been stopped for several minutes

TABLE 12-1 Complications of Parenteral Nutrition

Complication	Possible Cause	Signs or Symptoms	Intervention	Prevention
Air embolism	<ul style="list-style-type: none"> ■ Catheter system opened or IV tubing disconnected ■ Air entry on IV tubing changes 	<ul style="list-style-type: none"> ■ Apprehension ■ Chest pain ■ Dyspnea ■ Hypotension ■ Loud churning sound heard over pericardium on auscultation ■ Rapid and weak pulse ■ Respiratory distress 	<ul style="list-style-type: none"> ■ Clamp all ports of the IV catheter ■ Place the client in a left side-lying position with the head lower than the feet ■ Notify the HCP ■ Administer oxygen 	<ul style="list-style-type: none"> ■ Make sure all catheter connections are secure (use tape per agency protocol) ■ Clamp the catheter when not in use and when changing caps (follow agency protocol for flushing and clamping the catheter and cap changes) ■ Instruct the client in the Valsalva maneuver for tubing and cap changes ■ For tubing and cap changes, place the client in the Trendelenburg position (if not contraindicated) with the head turned in the opposite direction of the insertion site; client should hold breath and bear down
Hyperglycemia	<ul style="list-style-type: none"> ■ High concentration of dextrose in solution ■ Client receiving solution too quickly ■ Not enough insulin ■ Infection 	<ul style="list-style-type: none"> ■ Restlessness ■ Confusion ■ Weakness ■ Diaphoresis ■ Elevated blood glucose level > 200 mg/dL (10.9 mmol/L) ■ Excessive thirst ■ Fatigue ■ Kussmaul respirations ■ Coma (when severe) 	<ul style="list-style-type: none"> ■ Notify the HCP ■ The infusion rate may need to be slowed ■ Monitor blood glucose levels ■ Administer regular insulin as prescribed 	<ul style="list-style-type: none"> ■ Assess the client for a history of glucose intolerance ■ Assess the client's medication history (corticosteroids increase blood glucose) ■ Begin infusion at a slow rate as prescribed (usually 40-60 mL/h) ■ Monitor blood glucose levels per agency protocol ■ Administer regular insulin as prescribed ■ Use strict aseptic technique to prevent infection
Hypervolemia	<ul style="list-style-type: none"> ■ Excessive fluid administration or administration of fluid too rapidly ■ Renal dysfunction ■ Heart failure ■ Hepatic failure 	<ul style="list-style-type: none"> ■ Bounding pulse ■ Crackles on lung auscultation ■ Headache ■ Increased blood pressure ■ Jugular vein distention ■ Weight gain greater than desired 	<ul style="list-style-type: none"> ■ Slow or stop IV infusion ■ Notify the HCP ■ Restrict fluids ■ Administer diuretics ■ Use dialysis (in extreme cases) 	<ul style="list-style-type: none"> ■ Assess client's history for risk for hypervolemia ■ Administer via an electronic infusion device and ensure proper function of the device ■ Never increase the rate of infusion of the device to "catch up" if the infusion gets behind ■ Monitor intake and output ■ Monitor weight daily (ideal weight gain is 1-2 lb per week)
Hypoglycemia	<ul style="list-style-type: none"> ■ PN abruptly discontinued ■ Too much insulin being administered 	<ul style="list-style-type: none"> ■ Anxiety ■ Diaphoresis ■ Hunger ■ Low blood glucose level < 70 mg/dL (4 mmol/L) ■ Shakiness ■ Weakness 	<ul style="list-style-type: none"> ■ Notify the HCP ■ Administer IV dextrose ■ Monitor blood glucose level 	<ul style="list-style-type: none"> ■ Gradually decrease PN solution when discontinued ■ Infuse 10% dextrose at same rate as the PN to prevent hypoglycemia for 1-2 hours after the PN solution is discontinued ■ Monitor glucose levels and check the level 1 hour after discontinuing the PN
Infection	<ul style="list-style-type: none"> ■ Poor aseptic technique ■ Catheter contamination ■ Contamination of solution 	<ul style="list-style-type: none"> ■ Chills ■ Fever ■ Elevated white blood cell count ■ Redness or drainage at insertion site 	<ul style="list-style-type: none"> ■ Notify the HCP ■ Remove catheter ■ Send catheter tip to the laboratory for culture ■ Prepare to obtain blood cultures ■ Prepare for antibiotic administration 	<ul style="list-style-type: none"> ■ Use strict aseptic techniques (PN solution has a high concentration of glucose and is a medium for bacterial growth) ■ Monitor temperature (fever could indicate infection) ■ Assess IV site for signs of infection (redness, swelling, drainage) ■ Change site dressing, solution, and tubing as specified by agency policy ■ Do not disconnect tubing unnecessarily
Pneumothorax	<ul style="list-style-type: none"> ■ Inexact catheter placement resulting in puncture of the pleural space 	<ul style="list-style-type: none"> ■ Chest or shoulder pain ■ Sudden shortness of breath ■ Cyanosis ■ Tachycardia ■ Absence of breath sounds on affected side 	<ul style="list-style-type: none"> ■ Notify the HCP ■ Prepare to obtain a chest x-ray ■ Small pneumothorax may resolve ■ Larger pneumothorax may require chest tube 	<ul style="list-style-type: none"> ■ Monitor for signs of pneumothorax ■ Obtain a chest x-ray after insertion of the catheter to ensure proper catheter placement ■ PN is not initiated until correct catheter placement is verified and the absence of pneumothorax is confirmed

HCP, Health care provider; IV, intravenous; PN, parenteral nutrition.

Adapted from Ignatavicius D, Workman M: Medical-surgical nursing: patient-centered collaborative care, ed 7, St. Louis, 2013, Saunders.

(per agency procedure) because the PN solution can alter the results of the sample. The client with a central venous access site receiving PN should still have a venipuncture site.

- D. Monitor partial thromboplastin time and prothrombin time for clients receiving anticoagulants.
- E. Monitor electrolyte and albumin levels and liver and renal function studies, as well as any other prescribed laboratory studies. Blood studies for blood chemistries are normally done every other day or 3 times per week (per agency procedures) when the client is receiving PN; the results are the basis for the HCP continuing or changing the PN solution or rate.
- F. Monitor blood glucose levels as prescribed (usually every 4 hours) because of the risk for hyperglycemia from the PN solution components.
- G. In severely dehydrated clients, the albumin level may drop initially after initiating PN, because the treatment restores hydration.
- H. With severely malnourished clients, monitor for “refeeding syndrome” (a rapid drop in **potassium**, **magnesium**, and phosphate serum levels).
- I. The electrolyte shift that occurs in “refeeding syndrome” can cause cardiovascular, respiratory, and neurological problems; monitor for shallow respirations, confusion, weakness, bleeding tendencies, and seizures. If noted, the HCP is notified immediately.
- J. Abnormal liver function values may indicate intolerance to or an excess of fat emulsion or problems with metabolism with glucose and protein.
- K. Abnormal renal function tests may indicate an excess of amino acids.
- L. PN solutions should be stored under refrigeration and administered within 24 hours from the time they are prepared (remove from refrigerator 0.5 to 1 hour before use).
- M. PN solutions that are cloudy or darkened should not be used and should be returned to the pharmacy.
- N. Additions of substances such as nutrients to PN solutions should be made in the pharmacy and not on the nursing unit.
- O. Consultation with the nutritionist should be done on a regular basis (as prescribed or per agency protocol).

VI. Home Care Instructions (Box 12-2)

CRITICAL THINKING What Should You Do?

Answer: Difficulty with flushing the catheter indicates that the catheter is partially or fully blocked. Possible causes of a blockage include a clamped or kinked catheter, the tip of the catheter against the vein wall, thrombosis, or a precipitate buildup in the lumen. The nurse should not try to force the flushing because this could dislodge a clot or disrupt the integrity of the catheter. If the catheter becomes fully

blocked, it may not be usable. The nurse should assess for and alleviate clamping or kinking. The nurse should also instruct the client to change position, raise the arm, and cough. If the blockage is due to a positional issue, this intervention will correct it. The nurse should attempt to flush again to see if the problem has been corrected. If it has not, this difficulty should be reported to the necessary personnel (i.e., health care provider or intravenous nurse) so that full functionality can be regained. Fluoroscopy may be performed to determine the cause of the blockage and anticoagulant or thrombolytic medications may be instilled into the catheter as prescribed to alleviate blockage.

References: Lewis et al. (2014), p. 312; Perry, Potter, Ostendorf (2014), p. 504.

BOX 12-2 Home Care Instructions

- Teach the client and caregiver how to obtain, administer, and maintain parenteral nutrition fluids.
- Teach the client and caregiver how to change a sterile dressing.
- Obtain a daily weight at the same time of day in the same clothes.
- Stress that if a weight gain of more than 3 lb/week is noted, this may indicate excessive fluid intake and should be reported.
- Monitor the blood glucose level and report abnormalities immediately. Teach the client how to monitor for and manage hypoglycemia and hyperglycemia.
- Teach the client and caregiver about the signs and symptoms of side effects or adverse effects such as infection, thrombosis, air embolism, and catheter displacement.
- Teach the client and caregiver the actions to take if a complication arises and about the importance of reporting complications to the health care provider.
- For signs and symptoms of thrombosis, the client should report edema of the arm or at the catheter insertion site, neck pain, and jugular vein distention.
- Leaking of fluid from the insertion site or pain or discomfort as the fluids are infused may indicate displacement of the catheter; this must be reported immediately.
- Encourage the client and caregiver to contact the health care provider if they have questions about administration or any other questions.
- Inform the client and caregiver about the importance of follow-up care.
- Teach the client to keep electronic infusion devices fully charged in case of electrical power failure.

PRACTICE QUESTIONS

87. A client is being weaned from parenteral nutrition (PN) and is expected to begin taking solid food today. The ongoing solution rate has been 100 mL/hour. The nurse anticipates that which

- prescription regarding the PN solution will accompany the diet prescription?
1. Discontinue the PN.
 2. Decrease PN rate to 50 mL/hour.
 3. Start 0.9% normal saline at 25 mL/hour.
 4. Continue current infusion rate prescriptions for PN.
88. The nurse is preparing to change the parenteral nutrition (PN) solution bag and tubing. The client's central venous line is located in the right subclavian vein. The nurse asks the client to take which essential action during the tubing change?
1. Breathe normally.
 2. Turn the head to the right.
 3. Exhale slowly and evenly.
 4. Take a deep breath, hold it, and bear down.
89. A client with parenteral nutrition (PN) infusing has disconnected the tubing from the central line catheter. The nurse assesses the client and suspects an air embolism. The nurse should immediately place the client in which position?
1. On the left side, with the head lower than the feet
 2. On the left side, with the head higher than the feet
 3. On the right side, with the head lower than the feet
 4. On the right side, with the head higher than the feet
90. Which nursing action is essential prior to initiating a new prescription for 500 mL of fat emulsion (lipids) to infuse at 50 mL/hour?
1. Ensure that the client does not have diabetes.
 2. Determine whether the client has an allergy to eggs.
 3. Add regular insulin to the fat emulsion, using aseptic technique.
 4. Contact the health care provider (HCP) to have a central line inserted for fat emulsion infusion.
91. The nurse monitors the client receiving parenteral nutrition (PN) for complications of the therapy and should assess the client for which manifestations of hyperglycemia?
1. Fever, weak pulse, and thirst
 2. Nausea, vomiting, and oliguria
 3. Sweating, chills, and abdominal pain
 4. Weakness, thirst, and increased urine output
92. The nurse is changing the central line dressing of a client receiving parenteral nutrition (PN) and notes that the catheter insertion site appears reddened. The nurse should next assess which item?
1. Client's temperature
 2. Expiration date on the bag
 3. Time of last dressing change
 4. Tightness of tubing connections
93. The nurse is preparing to hang fat emulsion (lipids) and notes that fat globules are visible at the top of the solution. The nurse should take which action?
1. Roll the bottle of solution gently.
 2. Obtain a different bottle of solution.
 3. Shake the bottle of solution vigorously.
 4. Run the bottle of solution under warm water.
94. A client receiving parenteral nutrition (PN) suddenly develops a fever. The nurse notifies the health care provider (HCP), and the HCP initially prescribes that the solution and tubing be changed. What should the nurse do with the discontinued materials?
1. Discard them in the unit trash.
 2. Return them to the hospital pharmacy.
 3. Save them for return to the manufacturer.
 4. Prepare to send them to the laboratory for culture.
95. A client has been discharged to home on parenteral nutrition (PN). With each visit, the home care nurse should assess which parameter most closely in monitoring this therapy?
1. Pulse and weight
 2. Temperature and weight
 3. Pulse and blood pressure
 4. Temperature and blood pressure
- ❖ 96. The nurse, caring for a group of adult clients on an acute care medical-surgical nursing unit, determines that which clients would be the most likely candidates for parenteral nutrition (PN)? Select all that apply.
- 1. A client with extensive burns
 - 2. A client with cancer who is septic
 - 3. A client who has had an open cholecystectomy
 - 4. A client with severe exacerbation of Crohn's disease
 - 5. A client with persistent nausea and vomiting from chemotherapy
97. The nurse is preparing to hang the first bag of parenteral nutrition (PN) solution via the central line of an assigned client. The nurse should obtain which most essential piece of equipment before hanging the solution?
1. Urine test strips
 2. Blood glucose meter
 3. Electronic infusion pump
 4. Noninvasive blood pressure monitor
98. The nurse is making initial rounds at the beginning of the shift and notes that the parenteral nutrition (PN) bag of an assigned client is empty. Which solution should the nurse hang until another PN solution is mixed and delivered to the nursing unit?
1. 5% dextrose in water
 2. 10% dextrose in water
 3. 5% dextrose in Ringer's lactate
 4. 5% dextrose in 0.9% sodium chloride

99. The nurse is monitoring the status of a client's fat emulsion (lipid) infusion and notes that the infusion is 1 hour behind. Which action should the nurse take?
1. Adjust the infusion rate to catch up over the next hour.
 2. Increase the infusion rate to catch up over the next 2 hours.
 3. Ensure that the fat emulsion infusion rate is infusing at the prescribed rate.
 4. Adjust the infusion rate to run wide open until the solution is back on time.
100. A client receiving parenteral nutrition (PN) in the home setting has a weight gain of 5 lb in 1 week. The nurse should next assess the client for the presence of which condition?
1. Thirst
 2. Polyuria
 3. Decreased blood pressure
 4. Crackles on auscultation of the lungs
101. The nurse is caring for a restless client who is beginning nutritional therapy with parenteral nutrition (PN). The nurse should plan to ensure that which action is taken to prevent the client from sustaining injury?
1. Calculate daily intake and output.
 2. Monitor the temperature once daily.
 3. Secure all connections in the PN system.
 4. Monitor blood glucose levels every 12 hours.
102. A client receiving parenteral nutrition (PN) complains of a headache. The nurse notes that the client has an increased blood pressure, bounding pulse, jugular vein distention, and crackles bilaterally. The nurse determines that the client is experiencing which complication of PN therapy?
1. Sepsis
 2. Air embolism
 3. Hypervolemia
 4. Hyperglycemia

ANSWERS

87. 2

Rationale: When a client begins eating a regular diet after a period of receiving PN, the PN is decreased gradually. PN that is discontinued abruptly can cause hypoglycemia. Clients often have anorexia after being without food for some time, and the digestive tract also is not used to producing the digestive enzymes that will be needed. Gradually decreasing the infusion rate allows the client to remain adequately nourished during the transition to a normal diet and prevents the occurrence of hypoglycemia. Even before clients are started on a solid diet, they are given clear liquids followed by full liquids to further ease the transition. A solution of normal saline does not provide the glucose needed during the transition of discontinuing the PN and could cause the client to experience hypoglycemia. Test-Taking Strategy: Focus on the **subject**, weaning the client from the PN. Recalling the effects of PN and the complications that occur will direct you to the correct option. If you can recall that a client can experience hyperglycemia when started on PN, it may help you to remember that hypoglycemia can occur if the PN is discontinued abruptly.

Review: **Parenteral nutrition**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Glucose Regulation; Nutrition

References: Lewis et al. (2014), p. 902; Perry, Potter, Ostendorf (2014), pp. 799, 802.

88. 4

Rationale: The client should be asked to perform the Valsalva maneuver during tubing changes. This helps avoid air embolism during tubing changes. The nurse asks the client to take a deep breath, hold it, and bear down. If the intravenous line is on the right, the client turns his or her head to the left. This position increases intrathoracic pressure. Breathing normally and

exhaling slowly and evenly are inappropriate and could enhance the potential for an air embolism during the tubing change.

Test-Taking Strategy: Note the **strategic word**, essential. Recalling that air embolism is a complication that can occur during tubing changes and thinking about the measures that will prevent this complication will direct you to the correct option.

Review: The procedure for **parenteral nutrition** bag and tubing change and **air embolism**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

89. 1

Rationale: Air embolism occurs when air enters the catheter system, such as when the system is opened for intravenous (IV) tubing changes or when the IV tubing disconnects. Air embolism is a critical situation; if it is suspected, the client should be placed in a left side-lying position. The head should be lower than the feet. This position is used to minimize the effect of the air traveling as a bolus to the lungs by trapping it in the right side of the heart. The positions in the remaining options are inappropriate if an air embolism is suspected.

Test-Taking Strategy: Note the **strategic word**, immediately. Focus on the **subject**, the occurrence of an air embolism. Recall that the goal in this emergency situation is to trap air in the right side of the heart. Think about the position that will achieve this goal; this will direct you to the correct option.

90. 2

Rationale: The client beginning infusions of fat emulsions must be first assessed for known allergies to eggs to prevent anaphylaxis. Egg yolk is a component of the solution and provides emulsification. The remaining options are unnecessary and are not related specifically to the administration of fat emulsion.

Test-Taking Strategy: Focus on the **strategic word**, essential, when examining each option and recall knowledge of fat emulsions. Recall the components of fat emulsion to direct you to the correct option.

Review: **Fat emulsion** and **parenteral nutrition**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Clinical Judgment; Safety

References: Lewis et al. (2014), p. 901; Gahart, Nazareno (2015), p. 527.

91. 4

Rationale: The high glucose concentration in PN places the client at risk for hyperglycemia. Signs of hyperglycemia include excessive thirst, fatigue, restlessness, confusion, weakness, Kussmaul respirations, diuresis, and coma when hyperglycemia is severe. If the client has these symptoms, the blood glucose level should be checked immediately. The remaining options do not identify signs specific to hyperglycemia.

Test-Taking Strategy: Focus on the **subject**, signs of hyperglycemia. For an option to be correct, all of the parts of that option must be correct. Begin to answer this question by eliminating options that include fever and chills because they are indicative of infection. Choose the correct option over the option that includes oliguria because the client with hyperglycemia has increased urine output rather than decreased urine output.

Review: Signs of **hyperglycemia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Glucose Regulation; Nutrition

Reference: Perry, Potter, Ostendorf (2014), p. 798.

92. 1

Rationale: Redness at the catheter insertion site is a possible indication of infection. The nurse would next assess for other signs of infection. Of the options given, the temperature is the next item to assess. The tightness of tubing connections should be assessed each time the PN is checked; loose connections would result in leakage, not skin redness. The expiration date on the bag is a viable option, but this also should be checked at the time the solution is hung and with each shift change. The time of the last dressing change should be checked with each shift change.

Test-Taking Strategy: Note the **strategic word**, next. This question requires that you prioritize based on the information provided in the question. Also note the relationship between site appears reddened in the question and the word temperature in the correct option. Focusing on the **subject** of infection will direct you to the correct option.

Review: Signs of **infection** and **parenteral nutrition**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Clinical Judgment; Infection

Reference: Perry, Potter, Ostendorf (2014), pp. 798, 800.

93. 2

Rationale: Fat emulsion (lipids) is a white, opaque solution administered intravenously during parenteral nutrition therapy to prevent fatty acid deficiency. The nurse should examine the bottle of fat emulsion for separation of emulsion into layers of fat globules or for the accumulation of froth. The nurse should not hang a fat emulsion if any of these are observed and should return the solution to the pharmacy. Therefore, the remaining options are inappropriate actions.

Test-Taking Strategy: Remember that options that are **comparable or alike** are not likely to be correct. With this in mind, eliminate rolling the bottle and shaking the bottle first. Select between the remaining options by recalling the significance of fat globules in the solution. Also, think about the potential adverse effect of fat globules entering the client's bloodstream.

Review: Administration of **fat emulsion**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Priority Concepts: Clinical Judgment; Safety

Reference: Gahart, Nazareno (2015), p. 525.

94. 4

Rationale: When the client who is receiving PN develops a fever, a catheter-related infection should be suspected. The solution and tubing should be changed, and the discontinued materials should be cultured for infectious organisms per HCP prescription. The other options are incorrect. Because culture for infectious organisms is necessary, the discontinued materials are not discarded or returned to the pharmacy or manufacturer.

Test-Taking Strategy: Identifying the **subject** of the question, infection, and correlating the fever with infection associated with the intravenous line should direct you to the correct option. Remember that the discontinued materials need to be cultured.

Priority Concepts: Clinical Judgment; Infection

References: Lewis et al. (2014), p. 899; Perry, Potter, Ostendorf (2014), p. 804

95. 2

Rationale: The client receiving PN at home should have her or his temperature monitored as a means of detecting infection, which is a potential complication of this therapy. An infection also could result in sepsis because the catheter is in a blood vessel. The client's weight is monitored as a measure of the effectiveness of this nutritional therapy and to detect hypervolemia. The pulse and blood pressure are

important parameters to assess, but they do not relate specifically to the effects of PN.

Test-Taking Strategy: Note the **strategic word**, most, which tells you that more than 1 or all of the options may be partially or totally correct. Remember also that when there are multiple parts to an option, all parts must be correct for that option to be correct. Recalling that infection and hypervolemia are complications of PN and that weight is monitored as a measure of the effectiveness of this nutritional therapy will direct you to the correct option.

Review: **Parenteral nutrition**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Clinical Judgment; Infection

References: Lewis et al. (2014), p. 902; Perry, Potter, Ostendorf (2014), pp. 800, 804.

❖ 96. 1, 2, 4, 5

Rationale: PN is indicated in clients whose gastrointestinal tracts are not functional or must be rested, cannot take in a diet enterally for extended periods, or have increased metabolic need. Examples of these conditions include those clients with burns, exacerbation of Crohn's disease, and persistent nausea and vomiting due to chemotherapy. Other clients would be those who have had extensive surgery, have multiple fractures, are septic, or have advanced cancer or acquired immunodeficiency syndrome. The client with the open cholecystectomy is not a candidate because this client would resume a regular diet within a few days following surgery.

Test-Taking Strategy: Note the **strategic words**, most likely, which tell you that the correct options are the clients who require this type of nutritional support. Use nursing knowledge of these various conditions in the options and baseline knowledge of the purposes of PN to make your selection.

Review: **Parenteral nutrition**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Clinical Judgment; Nutrition

Reference: Perry, Potter, Ostendorf (2014), p. 797.

97. 3

Rationale: The nurse obtains an electronic infusion pump before hanging a PN solution. Because of the high glucose content, use of an infusion pump is necessary to ensure that the solution does not infuse too rapidly or fall behind. Because the client's blood glucose level is monitored every 4 to 6 hours during administration of PN, a blood glucose meter also will be needed, but this is not the most essential item needed before hanging the solution because it is not directly related to administering the PN. Urine test strips (to measure glucose) rarely are used because of the advent of blood glucose monitoring. Although the blood pressure will be monitored, a noninvasive blood pressure monitor is not the most essential piece of equipment needed for this procedure.

Test-Taking Strategy: Note the **strategic words**, most essential. They tell you that the correct option identifies the item needed to start the infusion. Visualizing the procedure for initiating PN

and focusing on the **strategic words** will direct you to the correct option.

Review: **Parenteral nutrition**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Clinical Judgment; Safety

98. 2

Rationale: The client is at risk for hypoglycemia; therefore, the solution containing the highest amount of glucose should be hung until the new PN solution becomes available. Because PN solutions contain high glucose concentrations, the 10% dextrose in water solution is the best of the choices presented. The solution selected should be one that minimizes the risk of hypoglycemia. The remaining options will not be as effective in minimizing the risk of hypoglycemia.

Test-Taking Strategy: Focus on the **subject**, that the client is at risk for hypoglycemia. With this in mind, you would then select the solution that minimizes this risk to the client. Also, remember that options that are **comparable or alike** are not likely to be correct. Each of the incorrect options represents a solution that contains 5% dextrose.

Review: The nursing actions to prevent **hypoglycemia** in the client receiving **parenteral nutrition**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care—Parenteral Nutrition

99. 3

Rationale: The nurse should not increase the rate of a fat emulsion to make up the difference if the infusion timing falls behind. Doing so could place the client at risk for fat overload. In addition, increasing the rate suddenly can cause fluid overload. The same principle (not increasing the rate) applies to parenteral nutrition or any intravenous infusion. Therefore, the remaining options are incorrect.

Test-Taking Strategy: Focus on the data in the question. Remember also that options that are **comparable or alike** are not likely to be correct. This guides you to eliminate the options referring to catching up. Choose the correct option over running the infusion wide open, recalling that the nurse never increases the infusion rate or adjusts an infusion rate if an infusion is behind.

100. 4

Rationale: Optimal weight gain when the client is receiving PN is 1 to 2 lb/week. The client who has a weight gain of 5 lb/week

while receiving PN is likely to have fluid retention. This can result in hypervolemia. Signs of hypervolemia include increased blood pressure, crackles on lung auscultation, a bounding pulse, jugular vein distention, headache, peripheral edema, and weight gain more than desired. Thirst and polyuria are associated with hyperglycemia. A decreased blood pressure is likely to be noted in deficient fluid volume.

Test-Taking Strategy: Focus on the **subject** of the question, a weight gain of 5 lb in 1 week, and note the **strategic word**, next. This should direct your thinking to the potential for hypervolemia. With this in mind, select the option that identifies the sign of hypervolemia.

Review: Signs and symptoms of **hypervolemia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

101. 3

Rationale: The nurse should plan to secure all connections in the tubing (connections are used per agency protocol). This helps to prevent the restless client from pulling the connections apart accidentally. The nurse should also monitor intake and output, but this does not relate specifically to a risk for injury as presented in the question. Also, monitoring the temperature and blood glucose levels does not relate to a risk for injury as presented in the question. In addition, the client's temperature and blood glucose levels are monitored more frequently than the time frames identified in the options to detect signs of infection and hyperglycemia, respectively.

Test-Taking Strategy: Focus on the **subject**, safety, and note the words restless, ensure, prevent, and injury. This will direct you to the correct option.

Review: Precautions related to **parenteral nutrition**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Critical Care—Parenteral Nutrition

Priority Concepts: Clinical Judgment; Safety

Reference: Lewis et al. (2014), pp. 899, 901.

102. 3

Rationale: Hypervolemia is a critical situation and occurs from excessive fluid administration or administration of fluid too rapidly. Clients with cardiac, renal, or hepatic dysfunction are also at increased risk. The client's signs and symptoms presented in the question are consistent with hypervolemia. The increased intravascular volume increases the blood pressure, whereas the pulse rate increases as the heart tries to pump the extra fluid volume. The increased volume also causes neck vein distention and shifting of fluid into the alveoli, resulting in lung crackles. The signs and symptoms presented in the question do not indicate sepsis, air embolism, or hyperglycemia.

Test-Taking Strategy: Focus on the **subject**, a complication of PN, and on the **data in the question**. Recalling the signs of hypervolemia will direct you to the correct option.

Review: Signs of **hypervolemia**

Level of Cognitive Ability: Synthesizing

Intravenous Therapy

PRIORITY CONCEPTS Fluids and Electrolytes; Safety

CRITICAL THINKING What Should You Do?

A client with a peripherally inserted central catheter (PICC) in the right upper extremity suddenly exhibits chest pain, dyspnea, hypotension, and tachycardia. The nurse suspects an embolism related to the PICC line. What should the nurse do?

Answer located on p. 153.

I. Intravenous Therapy

A. Purpose and uses

1. Used to sustain clients who are unable to take substances orally
2. Replaces water, electrolytes, and **nutrients** more rapidly than oral administration
3. Provides immediate access to the vascular system for the rapid delivery of specific solutions without the time required for gastrointestinal tract absorption
4. Provides a vascular route for the administration of medication or blood components

B. Types of solutions (Table 13-1)

1. Isotonic solutions
 - a. Have the same osmolality as body fluids
 - b. Increase extracellular fluid volume
 - c. Do not enter the cells because no osmotic force exists to shift the fluids
2. Hypotonic solutions
 - a. Are more dilute solutions and have a lower osmolality than body fluids
 - b. Cause the movement of water into cells by osmosis
 - c. Should be administered slowly to prevent cellular edema
3. Hypertonic solutions
 - a. Are more concentrated solutions and have a higher osmolality than body fluids
 - b. Cause movement of water from cells into the extracellular fluid by osmosis

4. Colloids

- a. Also called plasma expanders
- b. Pull fluid from the interstitial compartment into the vascular compartment
- c. Used to increase the vascular volume rapidly, such as in hemorrhage or severe hypovolemia

! Administration of an intravenous (IV) solution or medication provides immediate access to the vascular system. This is a benefit of administering solutions or medications via this route but can also present a risk. Therefore, it is critical to ensure that the health care provider's (HCP's) prescriptions are checked carefully and that the correct solution or medication is administered as prescribed. Always follow the 6 rights for medication administration.

II. Intravenous Devices

A. IV cannulas

1. Butterfly sets

- a. The set is a wing-tip needle with a metal cannula, plastic or rubber wings, and a plastic catheter or hub.
- b. The needle is 0.5 to 1.5 inches in length, with needle gauge sizes from 16 to 26.
- c. **Infiltration** is more common with these devices.
- d. The butterfly infusion set is used commonly in children and older clients, whose veins are likely to be small or fragile.

2. Plastic cannulas

- a. Plastic cannulas may be an over-the-needle device or an in-needle catheter and are used primarily for short-term therapy.
- b. The over-the-needle device is preferred for rapid infusion and is more comfortable for the client.
- c. The in-needle catheter can cause **catheter embolism** if the tip of the cannula breaks.

B. IV gauges

1. The gauge refers to the diameter of the lumen of the needle or cannula.
2. The smaller the gauge number, the larger the diameter of the lumen; the larger the gauge number, the smaller the diameter of the lumen.

TABLE 13-1 Types of Intravenous Solutions

Solution and Type	Uses
0.9% saline (NS): Isotonic	Extracellular fluid deficits in clients with low serum levels of sodium or chloride and metabolic acid-base imbalances. Used before or after the infusion of blood products.
Ringer's lactate solution: Isotonic	Extracellular fluid deficits, such as fluid loss from burns, bleeding, and dehydration from loss of bile or diarrhea.
5% dextrose in water (D ₅ W): Isotonic at the time of administration; within a short time after administration, dextrose is metabolized and the tonicity decreases in proportion to the osmolarity or tonicity of the nondextrose components (electrolytes) within the water (may become hypotonic).	Replaces deficits of total body water. Not used alone to expand extracellular fluid volume because dilution of electrolytes can occur.
5% dextrose in 0.225% saline (5% D/1/4 NS): Isotonic at the time of administration; within a short time after administration, dextrose is metabolized and the tonicity decreases in proportion to the osmolarity or tonicity of the nondextrose components (electrolytes) within the water (may become hypertonic).	Used as initial fluid for hydration because it provides more water than sodium. Commonly used as maintenance fluid.
5% dextrose in 0.9% saline (5% D/NS): Hypertonic	Extracellular fluid deficits in clients with low serum levels of sodium or chloride and metabolic alkalosis.
5% dextrose in 0.45% saline (5% D/1/2 NS): Hypertonic	Used as initial fluid for hydration because it provided more water than sodium. Commonly used as maintenance fluid.
5% dextrose in Ringer's lactate solution: Hypertonic	Extracellular fluid deficits, such as fluid loss from burns, bleeding, and dehydration from loss of bile or diarrhea.

3. The size of the gauge used depends on the solution to be administered and the diameter of the available vein.
4. Large-diameter lumens (smaller gauge numbers) allow a higher fluid rate than smaller diameter lumens and allow the administration of higher concentrations of solutions.
5. For rapid emergency fluid administration, blood products, or anesthetics, preoperative and postoperative clients, large-diameter lumen needles or cannulas are used, such as an 18- or 19-gauge lumen or cannula.
6. For peripheral **fat emulsion (lipids)** infusions, a 20- or 21-gauge lumen or cannula is used.
7. For standard IV fluid and clear liquid IV medications, a 22- or 24-gauge lumen or cannula is used.
8. If the client has very small veins, a 24- to 25-gauge lumen or cannula is used.

C. IV containers

1. Container may be glass or plastic.
2. Squeeze the plastic bag to ensure intactness and assess the glass bottle for any cracks before hanging.
3. Reconstitute any medications per agency protocol and pharmacy instruction.

! Do not write on a plastic IV bag with a marking pen because the ink may be absorbed through the plastic into the solution. Use a label and a ballpoint pen for writing on the label, placing the label onto the bag.

D. IV tubing (Fig. 13-1)

1. IV tubing contains a spike end for the bag or bottle, drip chamber, roller clamp, Y site, and adapter end for attachment to the cannula or needle that is inserted into the client's vein.

FIGURE 13-1 Intravenous (IV) tubing.

2. Shorter, secondary tubing is used for piggyback solutions, connecting them to the injection sites nearest to the drip chamber (Fig. 13-2).
3. Special tubing is used for medication that absorbs into plastic (check specific medication administration guidelines when administering IV medications).
4. Vented and nonvented tubing are available.
 - a. A vent allows air to enter the IV container as the fluid leaves.
 - b. A vented adapter can be used to add a vent to a nonvented IV tubing system.
 - c. Use nonvented tubing for flexible containers.

FIGURE 13-2 Secondary bag with medication. IV, Intravenous.

- d. Use vented tubing for glass or rigid plastic containers to allow air to enter and displace the fluid as it leaves; fluid will not flow from a rigid IV container unless it is vented.

! Extension tubing can be added to an IV tubing set to provide extra length to the tubing. Add extension tubing to the IV tubing set for children, clients who are restless, or clients who have special mobility needs.

E. Drip chambers (Fig. 13-3)

1. Macro drip chamber

- The chamber is used if the solution is thick or is to be infused rapidly.
- The drop factor varies from 10 to 20 drops (gtt)/mL, depending on the manufacturer.
- Read the tubing package to determine how many drops per milliliter are delivered (drop factor).

FIGURE 13-3 Macro drip and microdrip sizes.

2. Microdrip chamber

- Normally, the chamber has a short vertical metal piece (stylet) where the drop forms.
- The chamber delivers about 60 gtt/mL.
- Read the tubing package to determine the drop factor (gtt/mL).
- Microdrip chambers are used if fluid will be infused at a slow rate (less than 50 mL/hour) or if the solution contains potent medication that needs to be titrated, such as in a critical care setting or in pediatric clients.

F. Filters

- Filters provide protection by preventing particles from entering the client's veins.
- They are used in IV lines to trap small particles such as undissolved substances, or medications that have precipitated in solution.
- Check the agency policy regarding the use of filters.
- A 0.22- μ m filter is used for most solutions; a 1.2- μ m filter is used for solutions containing lipids or albumin; and a special filter is used for blood components.
- Change filters every 24 to 72 hours (depending on agency policy) to prevent bacterial growth.

G. Needleless infusion devices

- Needleless infusion devices include recessed needles, plastic cannulas, and 1-way valves; these systems decrease the exposure to contaminated needles.
- Do not administer **parenteral nutrition** or blood products through a 1-way valve.

H. Intermittent infusion devices

- Intermittent infusion devices are used when intravascular accessibility is desired for intermittent administration of medications by IV push or IV piggyback.
- Patency is maintained by periodic flushing with normal saline solution (sodium chloride and normal saline are interchangeable names).
- Depending on agency policy, when administering medication, flush with 1 to 2 mL of normal saline to confirm placement of the IV cannula; administer the prescribed medication and then flush the cannula again with 1 to 2 mL of normal saline to maintain patency.

I. Electronic IV infusion devices

- IV infusion pumps control the amount of fluid infusing and should be used with central venous lines, arterial lines, solutions containing medication, and parenteral nutrition infusions. Most agencies use IV pumps for the infusion of any IV solution.
- A syringe pump is used when a small volume of medication is administered; the syringe that contains the medication and solution fits into a pump and is set to deliver the medication at a controlled rate.
- Patient-controlled analgesia (PCA)

- a. A device that allows the client to self-administer IV medication, such as an analgesic; the client can administer doses at set intervals and the pump can be set to lock out doses that are not within the preset time frame to prevent overdose.
- b. The PCA regimen may include a basal rate of infusion along with the demand dosing, basal rate infusion alone, or demand dosing alone.
- c. A bolus dose can be given prior to any of the settings and should be set based on the HCP's prescription.
- d. PCAs are always kept locked and setup requires the witness of another registered nurse (RN).

! Check electronic IV infusion devices frequently. Although these devices are electronic, this does not ensure that they are infusing solutions and medications accurately.

III. Latex Allergy

- A. Assess the client for an allergy to latex.
- B. IV supplies, including IV catheters, IV tubing, IV ports (particularly IV rubber injection ports), rubber stoppers on multidose vials, and adhesive tape, may contain latex.
- C. Latex-safe IV supplies need to be used for clients with a latex allergy; most agencies carry these now, but this still needs to be checked.
- D. See Chapter 66 for additional information regarding latex allergy.

IV. Selection of a Peripheral IV Site

- A. Veins in the hand, forearm, and antecubital fossa are suitable sites (Fig. 13-4).
- B. Veins in the lower extremities (legs and feet) are not suitable for an adult client because of the risk of thrombus formation and the possible pooling of medication in areas of decreased venous return (Box 13-1).
- C. Veins in the scalp and feet may be suitable sites for infants.

FIGURE 13-4 Common intravenous sites. A, Inner arm. B, Dorsal surface of hand.

BOX 13-1 Peripheral Intravenous Sites to Avoid

- Edematous extremity
- An arm that is weak, traumatized, or paralyzed
- The arm on the same side as a mastectomy
- An arm that has an arteriovenous fistula or shunt for dialysis
- A skin area that is infected

- D. Assess the veins of both arms closely before selecting a site.
- E. Start the IV infusion distally to provide the option of proceeding up the extremity if the vein is ruptured or **infiltration** occurs; if infiltration occurs from the antecubital vein, the lower veins in the same arm usually should not be used for further puncture sites.
- F. Determine the client's dominant side, and select the opposite side for a **venipuncture** site.
- G. Bending the elbow on the arm with an IV may easily obstruct the flow of solution, causing infiltration that could lead to thrombophlebitis.
- H. Avoid checking the blood pressure on the arm receiving the IV infusion if possible.
- I. Do not place restraints over the venipuncture site.
- J. Use an armboard as needed when the venipuncture site is located in an area of flexion.

! In an adult, the most frequently used sites for inserting an IV cannula or needle are the veins of the forearm because the bones of the forearm act as a natural support and splint.

V. Initiation and Administration of IV Solutions

- A. Check the IV solution against the HCP's prescription for the type, amount, percentage of solution, and rate of flow; follow the 6 rights for medication administration.
- B. Assess the health status and medical disorders of the client and identify client conditions that contraindicate use of a particular IV solution or IV equipment, such as an allergy to cleansing solution, adhesive materials, or latex. Check compatibility of IV solutions as appropriate.
- C. Check client's identification and explain the procedure to the client; assess client's previous experience with IV therapy and preference for insertion site.
- D. Wash hands thoroughly before inserting an IV line and before working with an IV line; wear gloves.
- E. Use sterile technique when inserting an IV line and when changing the dressing over the IV site.
- F. Change the venipuncture site every 72 to 96 hours in accordance with Centers for Disease Control and Prevention (CDC) recommendations and agency policy.
- G. Change the IV dressing when the dressing is wet or contaminated, or as specified by the agency policy.
- H. Change the IV tubing every 96 hours in accordance with CDC recommendations and agency policy or with change of venipuncture site.

- I. Do not let an IV bag or bottle of solution hang for more than 24 hours to diminish the potential for bacterial contamination and possibly sepsis.
- J. Do not allow the IV tubing to touch the floor to prevent potential bacterial contamination.
- K. See [Priority Nursing Actions](#) for instructions on inserting an IV.
- L. See [Priority Nursing Actions](#) for instructions on removing an IV.

PRIORITY NURSING ACTIONS

Inserting a Peripheral Intravenous Line

1. Check the health care provider's (HCP's) prescription, determine the type and size of infusion device, and prepare intravenous (IV) tubing or extension set and solution; prime IV tubing or extension set to remove air from the system; explain procedure to the client.
2. Select the vein for insertion based on vein quality, client size, and indication of IV therapy; apply tourniquet and palpate the vein for resilience (see [Fig. 13-4](#)).
3. Clean the skin with an antimicrobial solution, using an inner to outer circular motion, or as specified by the Centers for Disease Control and Prevention (CDC) guidelines and agency policy.
4. Stabilize the vein below the insertion site and puncture the skin and vein, observing for blood in the flashback chamber; when observed, lower the catheter so that it is flush with the skin and advance the catheter into the vein (if unsuccessful, a new sterile device is used for the next attempt at insertion).
5. Remove the tourniquet. Apply pressure above the insertion site with the middle finger of the nondominant hand and retract the stylet from the catheter; connect the end of the IV tubing or extension set to the catheter tubing, secure it, and begin IV flow. Ask the client about comfort at the site and assess site for adequate flow.
6. Tape and secure insertion site with a transparent dressing as specified by agency procedure; label the tubing, dressing, and solution bags clearly, indicating the date and time.
7. Document the specifics about the procedure such as number of attempts at insertion; the insertion site, type and size of device, solution and flow rate, and time; and the client's response. In addition, follow agency procedure for documentation of procedure.

The nurse checks the HCP's prescription for the IV line and then determines the type and size of infusion device. The type and size are important to ensure adequate flow of the prescribed solution. For example, if a blood product is prescribed, the nurse would need to insert an appropriate catheter gauge size for blood delivery. The nurse also considers the client's size, age, mobility, and other factors in selecting the type and size of the infusion device. The nurse prepares the appropriate IV tubing or extension set and primes the IV tubing or extension set to remove air from the system. The appropriate vein is selected, the tourniquet is applied, and the vein is checked and palpated for resilience. Strict surgical asepsis is employed and the skin is cleaned with an antimicrobial solution (as specified by agency policy), using an inner to outer circular motion. The vein is stabilized to prevent its movement and the skin is punctured. Blood in the flashback chamber indicates that the device is in the vein and when noted the catheter is carefully advanced to avoid puncture of the back wall of the vein. The tourniquet is removed, the stylet is removed from the catheter device, the IV tubing or extension set is connected, and the IV flow is started. Following assessment of the client and site, the nurse tapes and secures the site and labels the tubing, dressing, and solution bag appropriately and according to agency policy. The nurse checks the site and ensures that the solution is flowing. Finally, the nurse documents the specifics about the procedure.

Reference

Perry, Potter, Ostendorf (2014), pp. 697, 701-703.

PRIORITY NURSING ACTIONS

Removing a Peripheral Intravenous Line

1. Check the health care provider's (HCP's) prescription and explain the procedure to the client; ask the client to hold the extremity still during cannula or needle removal.
2. Turn off the intravenous (IV) tubing clamp and remove the dressing and tape covering the site, while stabilizing the catheter.
3. Apply light pressure with sterile gauze or other material as specified by agency procedure over the site and withdraw the catheter using a slow, steady movement, keeping the hub parallel to the skin.
4. Apply pressure for 2 to 3 minutes, using dry sterile gauze (apply pressure for a longer period of time if the client has a bleeding disorder or is taking anticoagulant medication).
5. Inspect the site for redness, drainage, or swelling; check the catheter for intactness.
6. Apply dressing as needed per agency policy.
7. Document the procedure and the client's response.

The nurse checks for an HCP's prescription to remove the IV line and then explains the procedure to the client. The nurse asks the client to hold the extremity still during removal. The IV tubing clamp is placed in the off position and the dressing and tape are removed. The nurse is careful to stabilize the catheter so that it is not pulled, resulting in vein trauma. Light pressure is applied over the site to stabilize the catheter and it is removed using a slow, steady movement, keeping the hub parallel to the skin. Pressure is applied until hemostasis occurs. The site is inspected for redness, drainage, or swelling and the catheter is checked for intactness to ensure that no part of it has broken off. A dressing is applied as needed per agency policy. Finally, the nurse documents the procedure and the client's response.

Reference

Perry, Potter, Ostendorf (2014), pp. 723-724.

VI. Precautions for IV Lines

- A. On insertion, an IV line can cause initial pain and discomfort for the client.
- B. An IV puncture provides a route of entry for microorganisms into the body.
- C. Medications administered by the IV route enter the blood immediately, and any adverse reactions or allergic responses can occur immediately.
- D. Fluid (circulatory) overload or electrolyte imbalances can occur from excessive or too rapid infusion of IV fluids.
- E. Incompatibilities between certain solutions and medications can occur.

! A client with heart failure or renal failure usually is not given a solution containing saline because this type of fluid promotes the retention of water and would therefore exacerbate heart failure or renal failure by increasing the fluid overload.

VII. Complications (Table 13-2)

A. Air embolism

1. Description: A bolus of air enters the vein through an inadequately primed IV line, from a loose connection, during tubing change, or during removal of the IV.
2. Prevention and interventions
 - a. Prime tubing with fluid before use, and monitor for any air bubbles in the tubing.
 - b. Secure all connections.
 - c. Replace the IV fluid before the bag or bottle is empty.
 - d. Monitor for signs of air embolism; if suspected, clamp the tubing, turn the client on the left side with the head of the bed lowered (Trendelenburg position) to trap the air in the right atrium, and notify the HCP.

B. Catheter embolism

1. Description: An obstruction that results from breakage of the catheter tip during IV line insertion or removal
2. Prevention and interventions
 - a. Remove the catheter carefully.
 - b. Inspect the catheter when removed.
 - c. If the catheter tip has broken off, place a tourniquet as proximally as possible to the IV site on the affected limb, notify the HCP immediately, prepare to obtain a radiograph, and prepare the client for surgery to remove the catheter piece(s), if necessary.

C. Circulatory overload

1. Description: Also known as fluid overload; results from the administration of fluids too rapidly, especially in a client at risk for fluid overload
2. Prevention and interventions

TABLE 13-2 Signs of Complications of Intravenous Therapy

Complication	Signs
Air embolism	Tachycardia Chest pain and dyspnea Hypotension Cyanosis Decreased level of consciousness
Catheter embolism	Decrease in blood pressure Pain along the vein Weak, rapid pulse Cyanosis of the nail beds Loss of consciousness
Circulatory overload	Increased blood pressure Distended jugular veins Rapid breathing Dyspnea Moist cough and crackles
Electrolyte overload	Signs depend on the specific electrolyte overload imbalance
Hematoma	Ecchymosis, immediate swelling and leakage of blood at the site, and hard and painful lumps at the site
Infection	Local—redness, swelling, and drainage at the site Systemic—chills, fever, malaise, headache, nausea, vomiting, backache, tachycardia
Infiltration	Edema, pain, numbness, and coolness at the site; may or may not have a blood return
Phlebitis	Heat, redness, tenderness at the site Not swollen or hard Intravenous infusion sluggish
Thrombophlebitis	Hard and cordlike vein Heat, redness, tenderness at site Intravenous infusion sluggish
Tissue damage	Skin color changes, sloughing of the skin, discomfort at the site

- a. Identify clients at risk for circulatory overload.
- b. Calculate and monitor the drip (flow) rate frequently.
- c. Use an electronic IV infusion device and frequently check the drip rate or setting (at least every hour for an adult).
- d. Add a time tape (label) to the IV bag or bottle next to the volume markings. Mark on the tape the expected hourly decrease in volume based on the mL/hour calculation (Fig. 13-5).

FIGURE 13-5 Intravenous fluid bag with medication label and time-tape. (From Potter et al., 2013.)

- e. Monitor for signs of circulatory overload. If circulatory overload occurs, decrease the flow rate to a minimum, at a keep-vein-open rate; elevate the head of the bed; keep the client warm; assess lung sounds; assess for edema; and notify the HCP.

! Clients with respiratory, cardiac, renal, or liver disease; older clients; and very young persons are at risk for circulatory overload and cannot tolerate an excessive fluid volume.

D. Electrolyte overload

1. Description: An electrolyte imbalance is caused by too rapid or excessive infusion or by use of an inappropriate IV solution.
2. Prevention and interventions
 - a. Assess laboratory value reports.
 - b. Verify the correct solution.
 - c. Calculate and monitor the flow rate.
 - d. Use an electronic IV infusion device and frequently check the drip rate or setting (at least every hour for an adult).
 - e. Add a time tape (label) to the IV bag or bottle (see Fig. 13-5).
 - f. Place a red medication sticker on the bag or bottle if a medication has been added to the IV solution (see Fig. 13-5).
 - g. Monitor for signs of an electrolyte imbalance, and notify the HCP if they occur.

! Lactated Ringer's solution contains potassium and should not be administered to clients with acute kidney injury or chronic kidney disease.

E. Hematoma

1. Description: The collection of blood in the tissues after an unsuccessful venipuncture or after the venipuncture site is discontinued and blood continues to ooze into the tissue
2. Prevention and interventions
 - a. When starting an IV, avoid piercing the posterior wall of the vein.
 - b. Do not apply a tourniquet to the extremity immediately after an unsuccessful venipuncture.
 - c. When discontinuing an IV, apply pressure to the site for 2 to 3 minutes and elevate the extremity; apply pressure longer for clients with a bleeding disorder or who are taking anticoagulants.
 - d. If a hematoma develops, elevate the extremity and apply pressure and ice as prescribed.
 - e. Document accordingly, including taking pictures of the IV site if indicated by agency policy.

F. Infection

1. Description
 - a. Infection occurs from the entry of microorganisms into the body through the venipuncture site.
 - b. **Venipuncture** interrupts the integrity of the skin, the first line of defense against infection.
 - c. The longer the therapy continues, the greater the risk for infection.
 - d. Infection can occur locally at the IV insertion site or systemically from the entry of microorganisms into the body.
2. At-risk clients
 - a. Immunocompromised clients with diseases such as cancer, human immunodeficiency virus or acquired immunodeficiency syndrome, those receiving biologic modifier response medications for treatment of autoimmune conditions, or status post organ transplant are at risk for infection.
 - b. Clients receiving treatments such as chemotherapy who have an altered or lowered white blood cell count are at risk for infection.
 - c. Older clients, because aging alters the effectiveness of the immune system, are at risk for infection.
 - d. Clients with diabetes mellitus are at risk for infection.
3. Prevention and interventions
 - a. Assess the client for predisposition to or risk for infection.
 - b. Maintain strict asepsis when caring for the IV site.
 - c. Monitor for signs of local or systemic infection.

- d. Monitor white blood cell counts.
- e. Check fluid containers for cracks, leaks, cloudiness, or other evidence of contamination.
- f. Change IV tubing every 96 hours in accordance with CDC recommendations or according to agency policy; change IV site dressing when soiled or contaminated and according to agency policy.
- g. Label the IV site, bag or bottle, and tubing with the date and time to ensure that these are changed on time according to agency policy.
- h. Ensure that the IV solution is not hanging for more than 24 hours.
- i. If infection occurs, the HCP is notified; discontinue the IV, and place the venipuncture device in a sterile container for possible culture.
- j. Prepare to obtain blood cultures as prescribed if infection occurs and document accordingly.
- k. Restart an IV in the opposite arm to differentiate sepsis (systemic infection) from local infection at the IV site.
- l. Document accordingly, including taking pictures of the IV site if indicated by agency policy.

 A client with diabetes mellitus usually does not receive dextrose (glucose) solutions because the solution can increase the blood glucose level.

G. Infiltration

1. Description
 - a. Infiltration is seepage of the IV fluid out of the vein and into the surrounding interstitial spaces.
 - b. Infiltration occurs when an access device has become dislodged or perforates the wall of the vein or when venous backpressure occurs because of a clot or venospasm.
2. Prevention and interventions
 - a. Avoid venipuncture over an area of flexion.
 - b. Anchor the cannula and a loop of tubing securely with tape.
 - c. Use an armboard or splint as needed if the client is restless or active.
 - d. Monitor the IV rate for a decrease or a cessation of flow.
 - e. Evaluate the IV site for infiltration by occluding the vein proximal to the IV site. If the IV fluid continues to flow, the cannula is probably outside the vein (infiltrated); if the IV flow stops after occlusion of the vein, the IV device is still in the vein.
 - f. Lower the IV fluid container below the IV site, and monitor for the appearance of blood in

the IV tubing; if blood appears, the IV device is most likely in the vein.

- g. If infiltration has occurred, remove the IV device immediately; elevate the extremity and apply compresses (warm or cool, depending on the IV solution that was infusing and the HCP's prescription) over the affected area.
- h. Do not rub an infiltrated area, which can cause hematoma.
- i. Document accordingly, including taking pictures of the IV site if indicated by agency policy.

H. Phlebitis and thrombophlebitis

1. Description
 - a. Phlebitis is an inflammation of the vein that can occur from mechanical or chemical (medication) trauma or from a local infection.
 - b. Phlebitis can cause the development of a clot (thrombophlebitis).
2. Prevention and interventions
 - a. Use an IV cannula smaller than the vein, and avoid using very small veins when administering irritating solutions.
 - b. Avoid using the lower extremities (legs and feet) as an access area for the IV.
 - c. Avoid venipuncture over an area of flexion.
 - d. Anchor the cannula and a loop of tubing securely with tape.
 - e. Use an armboard or splint as needed if the client is restless or active.
 - f. Change the venipuncture site every 72 to 96 hours in accordance with CDC recommendations and agency policy.
 - g. If phlebitis occurs, remove the IV device immediately and restart it in the opposite extremity; notify the HCP if phlebitis is suspected, and apply warm, moist compresses, as prescribed.
 - h. If thrombophlebitis occurs, do not irrigate the IV catheter; remove the IV, notify the HCP, and restart the IV in the opposite extremity.
 - i. Document accordingly, including taking pictures if indicated by agency policy.

I. Tissue damage

1. Description
 - a. Tissues most commonly damaged include the skin, veins, and subcutaneous tissue.
 - b. Tissue damage can be uncomfortable and can cause permanent negative effects.
 - c. Extravasation is a form of tissue damage caused by the seepage of vesicant or irritant solutions into the tissues; this occurrence requires immediate HCP notification so that treatment can be prescribed to prevent tissue necrosis.

2. Prevention and interventions
 - a. Use a careful and gentle approach when applying a tourniquet.
 - b. Avoid tapping the skin over the vein when starting an IV.
 - c. Monitor for ecchymosis when penetrating the skin with the cannula.
 - d. Assess for allergies to tape or dressing adhesives.
 - e. Monitor for skin color changes, sloughing of the skin, or discomfort at the IV site.
 - f. Notify the HCP if tissue damage is suspected.
 - g. Document accordingly, including taking pictures if indicated by agency policy.

! Always document the occurrence of a complication, assessment findings, actions taken, and the client's response according to agency policy.

VIII. Central Venous Catheters

A. Description

1. Central venous catheters (Fig. 13-6) are used to deliver hyperosmolar solutions, measure central venous pressure, infuse parenteral nutrition, or infuse multiple IV solutions or medications.
2. Catheter position is determined by radiography after insertion.

3. The catheter may have a single, double, or triple lumen.
4. The catheter may be inserted peripherally and threaded through the basilic or cephalic vein into the superior vena cava, inserted centrally through the internal jugular or subclavian veins, or surgically tunneled through subcutaneous tissue.
5. With multilumen catheters, more than 1 medication can be administered at the same time without incompatibility problems, and only 1 insertion site is present.

! For central line insertion, tubing change, and line removal, place the client in the Trendelenburg position if not contraindicated or in the supine position, and instruct the client to perform the Valsalva maneuver to increase pressure in the central veins when the IV system is open.

B. Tunneled central venous catheters

1. A more permanent type of catheter, such as the Hickman, Broviac, or Groshong catheter, is used for long-term IV therapy.
2. The catheter may be single lumen or multilumen.
3. The catheter is inserted in the operating room, and the catheter is threaded into the lower part of the vena cava at the entrance of the right atrium (entrance site), and tunneled under the

FIGURE 13-6 Central venous access sites. A, Subclavian catheter. B, Peripherally inserted central catheter (PICC). C, Femoral catheter. D, Hickman catheter. E, Subclavian catheter with implantable vascular access port. F, Implantable vascular access port.

skin to the exit site where the catheter comes out of the chest; the catheter at the exit site is secured by means of a "cuff" just under the skin at the exit site.

4. The catheter is fitted with an intermittent infusion device to allow access as needed and to keep the system closed and intact.
 5. Patency is maintained by flushing with a diluted heparin solution or normal saline solution, depending on the type of catheter, per agency policy.
- C. Vascular access ports (implantable port)
1. Surgically implanted under the skin, ports such as a Port-a-Cath, Mediport, or Infusaport are used for long-term administration of repeated IV therapy.
 2. For access, the port requires palpation and injection through the skin into the self-sealing port with a noncoring needle, such as a Huber point needle.
 3. Patency is maintained by periodic flushing with a diluted heparin solution as prescribed and as per agency policy.
- D. PICC line
1. The catheter is used for long-term IV therapy, frequently in the home.
 2. The basilic vein usually is used, but the median cubital and cephalic veins in the antecubital area also can be used.
 3. The catheter is threaded so that the catheter tip may terminate in the subclavian vein or superior vena cava.
 4. A small amount of bleeding may occur at the time of insertion and may continue for 24 hours, but bleeding thereafter is not expected.
 5. **Phlebitis** is a common complication.

IX. Epidural Catheter (Fig. 13-7)

- A. Catheter is placed in the epidural space for the administration of analgesics; this method of administration reduces the amount of medication needed to control pain; therefore, the client experiences fewer side effects.
- B. Assess client's vital signs, level of consciousness, and motor and sensory function of lower extremities.

FIGURE 13-7 Tunneled epidural catheter.

- C. Monitor insertion site for signs of infection and be sure that the catheter is secured to the client's skin and that all connections are taped to prevent disconnection.
- D. Check HCP's prescription regarding solution and medication administration.
- E. For continuous infusion, monitor the electronic infusion device for proper rate of flow.
- F. For bolus dose administration, follow the procedure for administering bolus doses through the catheter and follow agency procedure.
- G. Aspiration is done before injecting medication; if more than 1 mL of clear fluid or blood returns, the medication is not injected and the HCP or anesthesiologist is notified immediately (catheter may have migrated into the subarachnoid space or a blood vessel).

! Contraindications to an epidural catheter and administration of epidural analgesia include skeletal and spinal abnormalities, bleeding disorders, use of anticoagulants, history of multiple abscesses, and sepsis.

CRITICAL THINKING What Should You Do?

Answer: When a client has any type of central venous catheter, there is a risk for breaking of the catheter, dislodgement of a thrombus, or entry of air into the circulation, all of which can lead to an embolism. Signs and symptoms that this complication is occurring include sudden chest pain, dyspnea, tachypnea, hypoxia, cyanosis, hypotension, and tachycardia. If this occurs, the nurse should clamp the catheter, place the client on the left side with the head lower than the feet (to trap the embolism in the right atrium of the heart), administer oxygen, and notify the health care provider.

Reference: Ignatavicius, Workman (2016), p. 207.

PRACTICE QUESTIONS

103. A client had a 1000-mL bag of 5% dextrose in 0.9% sodium chloride hung at 1500. The nurse making rounds at 1545 finds that the client is complaining of a pounding headache and is dyspneic, experiencing chills, and apprehensive, with an increased pulse rate. The intravenous (IV) bag has 400 mL remaining. The nurse should take which action first?
 1. Slow the IV infusion.
 2. Sit the client up in bed.
 3. Remove the IV catheter.
 4. Call the health care provider (HCP).
104. The nurse has a prescription to hang a 1000-mL intravenous (IV) bag of 5% dextrose in water with 20 mEq of potassium chloride. The nurse also needs to hang an IV infusion of piperacillin/

tazobactam. The client has one IV site. The nurse should plan to take which action first?

1. Start a second IV site.
2. Check compatibility of the medication and IV fluids.
3. Mix the prepackaged piperacillin/tazobactam per agency policy.
4. Prime the tubing with the IV solution, and back-prime the medication.

- ❖ 105. The nurse is completing a time tape for a 1000-mL intravenous (IV) bag that is scheduled to infuse over 8 hours. The nurse has just placed the 1100 marking at the 500-mL level. The nurse would place the mark for 1200 at which numerical level (mL) on the time tape? Fill in the blank.

Answer: _____ mL

- ❖ 106. The nurse is making initial rounds on the nursing unit to assess the condition of assigned clients. Which assessment findings are consistent with infiltration? Select all that apply.

- 1. Pain and erythema
- 2. Pallor and coolness
- 3. Numbness and pain
- 4. Edema and blanched skin
- 5. Formation of a red streak and purulent drainage

107. The nurse is inserting an intravenous (IV) line into a client's vein. After the initial stick, the nurse would continue to advance the catheter in which situation?

1. The catheter advances easily.
2. The vein is distended under the needle.
3. The client does not complain of discomfort.
4. Blood return shows in the backflash chamber of the catheter.

108. The nurse is assessing a client's peripheral intravenous (IV) site after completion of a vancomycin infusion and notes that the area is reddened, warm, painful, and slightly edematous proximal to the insertion point of the IV catheter. At this time, which action by the nurse is best?

1. Check for the presence of blood return.
2. Remove the IV site and restart at another site.
3. Document the findings and continue to monitor the IV site.
4. Call the health care provider (HCP) and request that the vancomycin be given orally.

109. The nurse is preparing a continuous intravenous (IV) infusion at the medication cart. As the nurse goes to insert the spike end of the IV tubing into the IV bag, the tubing drops and the spike end hits the top of the medication cart. The nurse should take which action?

1. Obtain a new IV bag.
2. Obtain new IV tubing.
3. Wipe the spike end of the tubing with povidone iodine.
4. Scrub the spike end of the tubing with an alcohol swab.

110. A health care provider has written a prescription to discontinue an intravenous (IV) line. The nurse should obtain which item from the unit supply area for applying pressure to the site after removing the IV catheter?

1. Elastic wrap
2. Povidone iodine swab
3. Adhesive bandage
4. Sterile 2 × 2 gauze

- ❖ 111. A client rings the call light and complains of pain at the site of an intravenous (IV) infusion. The nurse assesses the site and determines that phlebitis has developed. The nurse should take which actions in the care of this client? Select all that apply.

- 1. Remove the IV catheter at that site.
- 2. Apply warm moist packs to the site.
- 3. Notify the health care provider (HCP).
- 4. Start a new IV line in a proximal portion of the same vein.
- 5. Document the occurrence, actions taken, and the client's response.

112. A client involved in a motor vehicle crash presents to the emergency department with severe internal bleeding. The client is severely hypotensive and unresponsive. The nurse anticipates that which intravenous (IV) solution will most likely be prescribed for this client?

1. 5% dextrose in lactated Ringer's solution
2. 0.33% sodium chloride (1/3 normal saline)
3. 0.45% sodium chloride (1/2 normal saline)
4. 0.225% sodium chloride (1/4 normal saline)

113. The nurse provides a list of instructions to a client being discharged to home with a peripherally inserted central catheter (PICC). The nurse determines that the client needs further instructions if the client made which statement?

1. "I need to wear a MedicAlert tag or bracelet."
2. "I need to restrict my activity while this catheter is in place."
3. "I need to keep the insertion site protected when in the shower or bath."
4. "I need to check the markings on the catheter each time the dressing is changed."

114. A client has just undergone insertion of a central venous catheter at the bedside under ultrasound. The nurse would be sure to check which results

before initiating the flow rate of the client's intravenous (IV) solution at 100 mL/hour?

1. Serum osmolality
2. Serum electrolyte levels
3. Intake and output record
4. Chest radiology results

115. Intravenous (IV) fluids have been infusing at 100 mL/hour via a central line catheter in the right internal jugular for approximately 24 hours to increase urine output and maintain the client's

blood pressure. Upon entering the client's room, the nurse notes that the client is breathing rapidly and coughing. For which additional signs of a complication should the nurse assess based on the previously known data?

1. Excessive bleeding
2. Crackles in the lungs
3. Incompatibility of the infusion
4. Chest pain radiating to the left arm

ANSWERS

103. 1

Rationale: The client's symptoms are compatible with circulatory overload. This may be verified by noting that 600 mL has infused in the course of 45 minutes. The first action of the nurse is to slow the infusion. Other actions may follow in rapid sequence. The nurse may elevate the head of the bed to aid the client's breathing, if necessary. The nurse also notifies the HCP. The IV catheter is not removed; it may be needed for the administration of medications to resolve the complication.

Test-Taking Strategy: Note the **strategic word**, first. This tells you that more than 1 or all of the options are likely to be correct actions and that the nurse needs to prioritize them according to a time sequence. You must be able to recognize the signs of circulatory overload. From this point, select the option that provides the intervention specific to circulatory overload.

Review: Nursing actions for **circulatory overload**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Content Area: Critical Care—Medications and Intravenous Therapy

Priority Concepts: Fluid and Electrolytes; Perfusion

Reference: Ignatavicius, Workman (2016), p. 207.

104. 2

Rationale: When hanging an IV antibiotic, the nurse should first check compatibility of the medication and the IV fluids currently prescribed. If the fluids and medication are incompatible, it would then be appropriate to start a second IV site. If they are compatible, the nurse should hang them together so as to avoid having to start another IV site. After this, the nurse should prepare the prepackaged piperacillin/tazobactam per agency policy, then prime the tubing with the IV solution, and then back-prime the medication. Back-priming prevents any medication from being lost during the priming process.

Test-Taking Strategy: Note the **strategic word**, first. This implies a correct time sequence, and you need to prioritize. Visualize and think through the steps of hanging an IV antibiotic or secondary medication, and make your choice accordingly.

Review: **Administration of an IV medication**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care—Medications and Intravenous Therapy

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 568, 573-574.

❖ 105. 375

Rationale: If the IV is scheduled to run over 8 hours, the hourly rate is 125 mL/hour. Using 500 mL as the reference point, the next hourly marking would be at 375 mL, which is 125 mL less than 500.

Test-Taking Strategy: Focus on the **subject**, intravenous infusion calculations. Use basic principles related to dosage calculation and IV administration to answer this question. Subtract 125 from 500 to yield 375.

❖ 106. 2, 3, 4

Rationale: An infiltrated intravenous (IV) line is one that has dislodged from the vein and is lying in subcutaneous tissue. Pallor, coolness, edema, pain, numbness, and blanched skin are the results of IV fluid being deposited in the subcutaneous tissue. When the pressure in the tissues exceeds the pressure in the tubing, the flow of the IV solution will stop, and if an electronic pump is being used, it will alarm. Erythema can be associated with infection, phlebitis, or thrombosis. Formation of a red streak and purulent drainage is associated with phlebitis and infection.

Test-Taking Strategy: Focus on the **subject**, clinical manifestations at the IV site. Remember that pallor, coolness, pain, numbness, and swelling are signs of infiltration, and that infection, phlebitis, and thrombosis are associated with warmth at the IV site.

Review: Signs of **infiltration**

107. 4

Rationale: The IV catheter has entered the lumen of the vein successfully when blood backflash shows in the IV catheter. The vein should have been distended by the tourniquet before the vein was cannulated, and if further distention occurs after venipuncture, this could mean the needle went through the vein and into the tissue; therefore, the catheter should not be advanced. Client discomfort varies with the client, the site, and the nurse's insertion technique and is not a reliable measure of catheter placement. The nurse should not advance the catheter until placement in the vein is verified by blood return.

Test-Taking Strategy: Focus on the **subject** of the question, correct placement of an IV catheter. Noting the words blood return in the correct option will direct you to this option because a blood return is expected if the catheter is in a vein.

Review: Insertion of an **intravenous catheter**

Priority Concepts: Clinical Judgment; Perfusion

Reference: Perry, Potter, Ostendorf (2014), pp. 703-704.

108. 2

Rationale: Phlebitis at an IV site can be distinguished by client discomfort at the site and by redness, warmth, and swelling proximal to the catheter. If phlebitis occurs, the nurse should remove the IV line and insert a new IV line at a different site, in a vein other than the one that has developed phlebitis. Checking for the presence of blood return should be done before the administration of vancomycin because this medication is a vesicant. Documenting the findings and continuing to monitor the IV site and calling the HCP and requesting that the vancomycin be given orally do not address the immediate problem. Additionally, there could be indications for the prescription of IVs as opposed to oral vancomycin for the client. The HCP should be notified of the complications with the IV site, but not asked for a prescription for oral vancomycin.

Test-Taking Strategy: Note the **strategic word**, best. Also, **determine if an abnormality exists**. Based on the assessment findings noted in the question, it is clear that an abnormality does exist, so eliminate documenting and continuing to monitor. Next, recalling the appropriate nursing intervention for phlebitis will direct you to the correct option.

109. 2

Rationale: The nurse should obtain new IV tubing because contamination has occurred and could cause systemic infection to the client. There is no need to obtain a new IV bag because the bag was not contaminated. Wiping with povidone iodine or alcohol is insufficient and is contraindicated because the spike will be inserted into the IV bag.

Test-Taking Strategy: Focus on the **subject**, that the tubing was contaminated. Use knowledge of basic infection control measures and IV therapy concepts to answer this question. Remember that if an item is contaminated, discard it and obtain a new sterile item.

Review: **Surgical aseptic technique**

110. 4

Rationale: A dry sterile dressing such as a sterile 2 × 2 gauze is used to apply pressure to the discontinued IV site. This material is absorbent, sterile, and nonirritating. A povidone iodine swab would irritate the opened puncture site and would not stop the blood flow. An adhesive bandage or elastic wrap may be used to cover the site once hemostasis has occurred.

Test-Taking Strategy: Focus on the **subject**, care to the IV site after removal of the catheter, and note the words applying pressure. Visualize this procedure, thinking about each of the items identified in the options to direct you to the correct option.

Review: **Intravenous catheter removal**

❖ 111. 1, 2, 3, 5

Rationale: Phlebitis is an inflammation of the vein that can occur from mechanical or chemical (medication) trauma or from a local infection and can cause the development of a clot (thrombophlebitis). The nurse should remove the IV at the phlebotic site and apply warm moist compresses to the area to speed resolution of the inflammation. Because phlebitis has occurred, the nurse also notifies the HCP about the IV complication. The nurse should restart the IV in a vein other than the one that has developed phlebitis. Finally, the nurse documents the occurrence, actions taken, and the client's response.

Test-Taking Strategy: Focus on the **subject**, actions to take if phlebitis occurs. Recall that phlebitis is an inflammation of the vein. This will assist in eliminating the option that indicates to use the same vein because an IV should be restarted in a vein other than the one that has developed phlebitis.

112. 1

Rationale: For this client, the goal of therapy is to expand intravascular volume as quickly as possible. In this situation, the client will likely experience a decrease in intravascular volume from blood loss, resulting in decreased blood pressure. Therefore, a solution that increases intravascular volume, replaces immediate blood loss volume, and increases blood pressure is needed. The 5% dextrose in lactated Ringer's (hypertonic) solution would increase intravascular volume and immediately replace lost fluid volume until a transfusion could be administered, resulting in an increase in the client's blood pressure. The solutions in the remaining options would not be given to this client because they are hypotonic solutions and, instead of increasing intravascular space, the solutions would move into the cells via osmosis.

Test-Taking Strategy: Focus on the **subject**, that the client has been in a traumatic accident. Also, note the **strategic words**, most likely. Also note that the incorrect options are **comparable or** alike and include a % of normal saline. Determining that this client will likely experience decreased intravascular volume and blood pressure due to blood loss and recalling IV fluid types and how hypotonic and hypertonic solutions function within the intravascular space will direct you to the correct option.

Review: **Intravenous fluids**

113. 2

Rationale: The client should be taught that only minor activity restrictions apply with this type of catheter. The client should carry or wear a MedicAlert identification and should protect the site during bathing to prevent infection. The client should check the markings on the catheter during each dressing change to assess for catheter migration or dislodgement.

Test-Taking Strategy: Note the **strategic words**, needs further instructions. These words indicate a **negative event query** and the need to select the incorrect client statement. Recalling that the PICC is for long-term use will assist in directing you to the correct option. To restrict activity with such a catheter is unreasonable.

114. 4

Rationale: Before beginning administration of IV solution, the nurse should assess whether the chest radiology results reveal that the central catheter is in the proper place. This is necessary to prevent infusion of IV fluid into pulmonary or subcutaneous tissues. The other options represent items that are useful for the nurse to be aware of in the general care of this client, but they do not relate to this procedure.

Test-Taking Strategy: Note the **subject**, care to the client with a central venous catheter. Note the words insertion of a central venous catheter at the bedside. Recalling the potential complications associated with the insertion of central venous catheters will direct you to the correct option.

Review: Nursing actions related to **central venous catheters**

 References: Ignatavicius, Workman (2016), pp. 190-191, 193; Perry, Potter, Ostendorf (2014), p. 735.

115. 2

Rationale: Circulatory (fluid) overload is a complication of IV therapy. Signs include rapid breathing, dyspnea, a moist cough, and crackles. Blood pressure and heart rate also increase if circulatory overload is present. Therefore, since the nurse previously noted rapid breathing and coughing, the nurse should then assess for a moist cough and crackles. Hematoma is another potential complication and is characterized by ecchymosis, swelling, and leakage at the IV insertion site, as well as hard and painful lumps at the site. Allergic reaction is a complication of administration of IV fluids or medication and is characterized by chills, fever, malaise, headache, nausea, vomiting, backache, and tachycardia; this type of reaction could also occur if the IV solutions infused are incompatible; however, there was no indication of multiple solutions being infused simultaneously in this question. Chest pain radiating to the left arm is a classic sign of cardiac compromise and is not specifically related to a complication of IV therapy.

Test-Taking Strategy: Focus on **the data in the question** and note the **subject**, a complication. Noting that the client is experiencing rapid breathing and is coughing will assist in directing you to the correct option.

Administration of Blood Products

PRIORITY CONCEPTS Perfusion; Safety

CRITICAL THINKING What Should You Do?

The nurse is administering 1 unit of packed red blood cells (PRBCs) to a client who has never received a blood transfusion. The client suddenly becomes apprehensive and complains of back pain after the first 10 minutes of administration. What should the nurse do?

Answer located on p. 163.

I. Types of Blood Components

A. Packed red blood cells (PRBCs)

1. PRBCs are a blood product used to replace erythrocytes; infusion time for 1 unit is usually between 2 and 4 hours.
2. Each unit increases the hemoglobin level by 1 g/dL (10 mmol/L) and hematocrit by 3% (0.03); the change in laboratory values takes 4 to 6 hours after completion of the blood transfusion.
3. Evaluation of an effective response is based on the resolution of the symptoms of anemia and an increase in the erythrocyte, hemoglobin, and hematocrit count.
4. Leukocyte-poor or leukocyte-depleted units are units in which leukocytes, proteins, and plasma have been reduced. They are used to restore oxygen-carrying capacity of blood and intravascular volume.

! Washed red blood cells (depleted of plasma, platelets, and leukocytes) may be prescribed for a client with a history of allergic transfusion reactions or those who underwent hematopoietic stem cell transplant. Leukocyte depletion (leukoreduction) by filtration, washing, or freezing is the process used to decrease the amount of white blood cells (WBCs) in a unit of packed cells.

B. Platelet transfusion

1. Platelets are used to treat thrombocytopenia and platelet dysfunctions.
 - a. Clients receiving multiple units of platelets can become “alloimmunized” to different

platelet antigens. These clients may benefit from receiving only platelets that match their specific human leukocyte antigen (HLA).

2. **Crossmatching** is not required but usually is done (platelet concentrates contain few red blood cells [RBCs]).
3. The volume in a unit of platelets may vary; always check the bag for the volume of the blood component (in milliliters).
4. Platelets are administered immediately upon receipt from the blood bank and are given rapidly, usually over 15 to 30 minutes.
5. Evaluation of an effective response is based on improvement in the platelet count, and platelet counts normally are evaluated 1 hour and 18 to 24 hours after the transfusion; for each unit of platelets administered, an increase of 5000 to 10,000 mm^3 (5 to 10 $\times 10^9/\text{L}$) is expected.

C. Fresh-frozen plasma

1. Fresh-frozen plasma may be used to provide clotting factors or volume expansion; it contains no platelets.
2. Fresh-frozen plasma is infused within 2 hours of thawing, while clotting factors are still viable, and is infused over a period of 15 to 30 minutes.
3. Rh **compatibility** and **ABO** compatibility are required for the transfusion of **plasma** products.
4. Evaluation of an effective response is assessed by monitoring coagulation studies, particularly the prothrombin time and the partial thromboplastin time, and resolution of hypovolemia.

D. Cryoprecipitates

1. Prepared from fresh-frozen plasma, cryoprecipitates can be stored for 1 year. Once thawed, the product must be used; 1 unit is administered over 15 to 30 minutes.
2. Used to replace clotting factors, especially factor VIII and fibrinogen
3. Evaluation of an effective response is assessed by monitoring coagulation studies and fibrinogen levels.

- E. Granulocytes
1. May be used to treat a client with sepsis or a neutropenic client with an infection that is unresponsive to antibiotics
 2. Evaluation of an effective response is assessed by monitoring the WBC and differential counts.

 Document the necessary information about the blood transfusion in the client's medical record (follow agency guidelines). Include the client's tolerance and response to the transfusion and the effectiveness of the transfusion.

II. Types of Blood Donations

A. Autologous

1. A donation of the client's own blood before a scheduled procedure is an autologous donation; it reduces the risk of disease transmission and potential transfusion complications.
2. Autologous donation is not an option for a client with leukemia or bacteremia.
3. A donation can be made every 3 days as long as the hemoglobin remains within a safe range.
4. Donations should begin within 5 weeks of the transfusion date and end at least 3 days before the date of transfusion.

B. Blood salvage

1. Blood salvage is an autologous donation that involves suctioning blood from body cavities, joint spaces, or other closed body sites.
2. Blood may need to be "washed," a special process that removes tissue debris before reinfusion.

C. Designated donor

1. Designated donation occurs when recipients select their own compatible donors.
2. Donation does not reduce the risk of contracting infections transmitted by the blood; however, recipients feel more comfortable identifying their donors.

III. Compatibility (Table 14-1)

- A. Client (the recipient) blood samples are drawn and labeled at the client's bedside at the time the blood samples are drawn; the client is asked to state his or her name, which is compared with the name on the client's identification band or bracelet.
- B. The recipient's ABO type and Rh type are identified.
- C. An antibody screen is done to determine the presence of antibodies other than anti-A and anti-B.
- D. To determine compatibility, crossmatching is done, in which donor red blood cells are combined with the recipient's serum and Coombs' serum; the crossmatch is compatible if no RBC agglutination occurs.
- E. The universal RBC donor is O negative; the universal recipient is AB positive.

TABLE 14-1 Compatibility Chart for Red Blood Cell Transfusions

Donor	Recipient			
	A	B	AB	O
A	X		X	
B		X	X	
AB			X	
O	X	X	X	X

The ABO type of the donor should be compatible with the recipient's. Type A can receive from type A or O; type B from type B or O; type AB can receive from type A, B, AB, or O; type O only from type O.

From Ignatavicius D, Workman ML: Medical-surgical nursing: patient-centered collaborative care, ed 7, Philadelphia, 2013, Saunders.

- F. Clients with Rh-positive blood can receive RBC transfusion from an Rh-negative donor if necessary; however, an Rh-negative client should not receive Rh-positive blood.

 The donor's blood and the recipient's blood must be tested for compatibility. If the blood is not compatible, a life-threatening transfusion reaction can occur.

IV. Infusion Pumps

- A. Infusion pumps may be used to administer blood products if they are designed to function with opaque solutions; special intravenous (IV) tubing is used specifically for blood products to prevent hemolysis of red blood cells.
- B. Always consult manufacturer guidelines for how to use the pump and compatibility for use with blood transfusions.
- C. Special manual pressure cuffs designed specifically for blood product administration may be used to increase the flow rate, but it should not exceed 300 mm Hg.
- D. Standard sphygmomanometer cuffs are not to be used to increase the flow rate because they do not exert uniform pressure against all parts of the bag.

V. Blood Warmers

- A. Blood warmers may be used to prevent hypothermia and adverse reactions when several units of blood are being administered.
- B. Special warmers have been designed for this purpose, and only devices specifically approved for this use can be used.

 If blood warming is necessary, use only warming devices specifically designed and approved for warming blood products. Do not warm blood products in a microwave oven or in hot water.

VI. Precautions and Nursing Responsibilities (Box 14-1)

! Check the client's identity before administering a blood product. Be sure to check the health care provider's (HCP's) prescription, that the client has an appropriate venous access site, that crossmatching procedures have been completed, that an informed consent has been obtained, and that the correct client is receiving the correct type of blood. Use barcode scanning systems per agency policy to ensure client safety.

VII. Complications (Box 14-2)

A. Transfusion reactions

1. Description

- A transfusion reaction is an adverse reaction that happens as a result of receiving a blood transfusion.
- Types of transfusion reactions include hemolytic, allergic, febrile or bacterial reactions (septicemia), or transfusion-associated graft-versus-host disease (GVHD).

BOX 14-1 Precautions and Nursing Responsibilities

General Precautions

A large volume of refrigerated blood infused rapidly through a central venous catheter into the ventricle of the heart can cause cardiac dysrhythmias.

No solution other than normal saline should be added to blood components.

Medications are never added to blood components or piggybacked into a blood transfusion.

To avoid the risk of septicemia, infusions (1 unit) should not exceed the prescribed time for administration (2 to 4 hours for packed red blood cells); follow evidence-based practice guidelines and agency procedure.

The blood administration set should be changed with each unit of blood, or according to agency policy, to reduce the risk of septicemia.

Check the blood bag for the date of expiration; components expire at midnight on the day marked on the bag unless otherwise specified.

Inspect the blood bag for leaks, abnormal color, clots, and bubbles.

Blood must be administered as soon as possible (within 20 to 30 minutes) after being received from the blood bank, because this is the maximal allowable time out of monitored storage.

Never refrigerate blood in refrigerators other than those used in blood banks; if the blood is not administered within 20 to 30 minutes, return it to the blood bank.

The recommended rate of infusion varies with the blood component being transfused and depends on the client's condition; generally blood is infused as quickly as the client's condition allows.

Components containing few red blood cells (RBCs) and platelets may be infused rapidly, but caution should be taken to avoid circulatory overload.

The nurse should measure vital signs and assess lung sounds before the transfusion and again after the first 15 minutes and every 30 minutes to 1 hour (per agency policy) until 1 hour after the transfusion is completed.

Client Assessment

Assess for any cultural or religious beliefs regarding blood transfusions.

A Jehovah's Witness cannot receive blood or blood products; this group believes that receiving a blood transfusion has eternal consequences.

Ensure that an informed consent has been obtained.

Explain the procedure to the client and determine whether the client has ever received a blood transfusion or experienced any previous reactions to blood transfusions.

Check the client's vital signs; assess renal, circulatory, and respiratory status and the client's ability to tolerate intravenously administered fluids.

If the client's temperature is elevated, notify the health care provider (HCP) before beginning the transfusion; a fever may be a cause for delaying the transfusion in addition to masking a possible symptom of an acute transfusion reaction.

Blood Bank Precautions

Blood will be released from the blood bank only to personnel specified by agency policy.

The name and identification number of the intended recipient must be provided to the blood bank, and a documented permanent record of this information must be maintained. Blood should be transported from the blood bank to only 1 client at a time to prevent blood delivery to the wrong client.

Only 1 unit of blood should be transported at a time, even if the client is prescribed to have more than 1 unit transfused.

Client Identity and Compatibility

Check the HCP's prescription for the administration of the blood product.

The most critical phase of the transfusion is confirming product compatibility and verifying client identity.

Universal barcode systems for blood transfusions should be used to confirm product compatibility, client identity, and expiration.

Two licensed nurses (follow agency policy) need to check the HCP's prescription, the client's identity, and the client's identification band or bracelet and number, verifying that the name and number are identical to those on the blood component tag.

At the bedside, the nurse asks the client to state his or her name, and the nurse compares the name with the name on the identification band or bracelet.

The nurse checks the blood bag tag, label, and blood requisition form to ensure that ABO and Rh types are compatible. The nurse uses the barcode scanning system per agency policy.

If the nurse notes any inconsistencies when verifying client identity and compatibility, the nurse notifies the blood bank immediately.

BOX 14-1 Precautions and Nursing Responsibilities—cont'd**Administration of the Transfusion**

Maintain standard and transmission-based precautions and surgical asepsis as necessary.

Insert an intravenous (IV) line and infuse normal saline; maintain the infusion at a keep-vein-open rate.

An 18- or 19-gauge IV needle will be needed to achieve a maximum flow rate of blood products and to prevent damage to RBCs; if a smaller gauge needle must be used, RBCs may be diluted with normal saline (check agency procedure).

A central venous catheter is an acceptable venous access option for blood transfusions; for a multilumen catheter, use the largest catheter port available or check the port size to ensure that it is adequate for blood administration.

Always check the bag for the volume of the blood component. Blood products should be infused through administration sets designed specifically for blood; use a Y-tubing or straight tubing blood administration set that contains a filter designed to trap fibrin clots and other debris that accumulate during blood storage (Fig. 14-1).

Premedicate the client with acetaminophen or diphenhydramine, as prescribed, if the client has a history of adverse reactions; if prescribed, oral medications should be administered 30 minutes before the transfusion is started, and intravenously administered medications may be given immediately before the transfusion is started.

Instruct the client to report anything unusual immediately.

Determine the rate of infusion by the HCP's prescription or, if not specified, by agency policy.

Begin the transfusion slowly under close supervision; if no reaction is noted within the first 15 minutes, the flow can be increased to the prescribed rate.

During the transfusion, monitor the client for signs and symptoms of a transfusion reaction; the first 15 minutes of the transfusion are the most critical, and the nurse must stay with the client.

If an ABO incompatibility exists or a severe allergic reaction occurs, the reaction is usually evident within the first 50 mL of the transfusion.

Document the client's tolerance to the administration of the blood product.

FIGURE 14-1 Tubing for blood administration has an in-line filter. (From Potter et al., 2013.)

Monitor appropriate laboratory values and document effectiveness of treatment related to the specific type of blood product.

Reactions to the Transfusion

If a transfusion reaction occurs, stop the transfusion, change the IV tubing down to the IV site, keep the IV line open with normal saline, notify the HCP and blood bank, and return the blood bag and tubing to the blood bank.

Do not leave the client alone, and monitor the client's vital signs and monitor for any life-threatening signs or symptoms.

Obtain appropriate laboratory samples, such as blood and urine samples (free hemoglobin indicates that RBCs were hemolyzed), according to agency policies.

BOX 14-2 Complications of a Blood Transfusion

- | | |
|-------------------------|------------------------|
| ▪ Transfusion reactions | ▪ Disease transmission |
| ▪ Circulatory overload | ▪ Hypocalcemia |
| ▪ Septicemia | ▪ Hyperkalemia |
| ▪ Iron overload | ▪ Citrate toxicity |

2. Signs of an immediate transfusion reaction

- Chills and diaphoresis
- Muscle aches, back pain, or chest pain
- Rashes, hives, itching, and swelling
- Rapid, thready pulse
- Dyspnea, cough, or wheezing

f. Pallor and cyanosis

g. Apprehension

h. Tingling and numbness

i. Headache

j. Nausea, vomiting, abdominal cramping, and diarrhea

3. Signs of a transfusion reaction in an unconscious client

a. Weak pulse

b. Fever

c. Tachycardia or bradycardia

d. Hypotension

e. Visible hemoglobinuria

f. Oliguria or anuria

4. Delayed transfusion reactions
 - a. Reactions can occur days to years after a transfusion.
 - b. Signs include fever, mild jaundice, and a decreased hematocrit level.

 Stay with the client for the first 15 minutes of the infusion of blood and monitor the client for signs and symptoms of a transfusion reaction; the first 15 minutes of the transfusion are the most critical, and the nurse must stay with the client. Vital signs are monitored every 30 minutes to one hour according to institutional protocol.

5. Interventions (see [Priority Nursing Actions](#))

 Stop the transfusion immediately if a blood transfusion reaction is suspected.

PRIORITY NURSING ACTIONS

Transfusion Reaction: Nursing Interventions

1. Stop the transfusion.
2. Change the intravenous (IV) tubing down to the IV site and keep the IV line open with normal saline.
3. Notify the health care provider (HCP) and blood bank.
4. Stay with the client, observing signs and symptoms and monitoring vital signs as often as every 5 minutes.
5. Prepare to administer emergency medications as prescribed.
6. Obtain a urine specimen for laboratory studies (perform any other laboratory studies as prescribed).
7. Return blood bag, tubing, attached labels, and transfusion record to the blood bank.
8. Document the occurrence, actions taken, and the client's response.

If the client exhibits signs of a transfusion reaction, the nurse immediately stops the transfusion and changes the IV tubing down to the IV site to prevent the entrance of additional blood solution into the client. Normal saline solution is hung and infused to keep the IV line open in the event that emergency medications need to be administered. The HCP is notified and the nurse also notifies the blood bank of the occurrence. The nurse stays with the client and monitors the client closely while other personnel obtain needed supplies to treat the client. As prescribed by the HCP, the nurse administers emergency medications such as antihistamines, vasopressors, fluids, and corticosteroids. The nurse then obtains a urine specimen for laboratory studies and any other laboratory studies as prescribed to check for free hemoglobin indicating that red blood cells were hemolyzed. The blood bag, tubing, attached labels, and transfusion record are returned to the blood bank so that the blood bank can check the items to determine the reason that the reaction occurred. Finally the nurse documents the occurrence, actions taken, and the client's response.

Reference

Ignatavicius, Workman (2016), pp. 824-825.

B. Circulatory overload

1. Description: Caused by the infusion of blood at a rate too rapid for the client to tolerate
2. Assessment
 - a. Cough, dyspnea, chest pain, and wheezing on auscultation of the lungs
 - b. Headache
 - c. Hypertension
 - d. Tachycardia and a bounding pulse
 - e. Distended neck veins
3. Interventions
 - a. Slow the rate of infusion.
 - b. Place the client in an upright position, with the feet in a dependent position.
 - c. Notify the HCP.
 - d. Administer oxygen, diuretics, and morphine sulfate, as prescribed.
 - e. Monitor for dysrhythmias.
 - f. Phlebotomy also may be a method of prescribed treatment in a severe case.

 If circulatory overload is suspected, immediately slow the rate of infusion and place the client in an upright position, with the feet in a dependent position.

C. Septicemia

1. Description: Occurs with the transfusion of blood that is contaminated with microorganisms
2. Assessment
 - a. Rapid onset of chills and a high fever
 - b. Vomiting
 - c. Diarrhea
 - d. Hypotension
 - e. Shock
3. Interventions
 - a. Notify the HCP.
 - b. Obtain blood cultures and cultures of the blood bag.
 - c. Administer oxygen, IV fluids, antibiotics, vasopressors, and corticosteroids as prescribed.

D. Iron overload

1. Description: A delayed transfusion complication that occurs in clients who receive multiple blood transfusions, such as clients with anemia or thrombocytopenia
2. Assessment
 - a. Vomiting
 - b. Diarrhea
 - c. Hypotension
 - d. Altered hematological values
3. Interventions
 - a. Deferoxamine, administered intravenously or subcutaneously, removes accumulated iron via the kidneys.
 - b. Urine turns red as iron is excreted after the administration of deferoxamine; treatment is discontinued when serum iron levels return to normal.

 **Contact the HCP immediately if a transfusion reaction or a complication of blood administration arises.**

- E. Disease transmission
1. The disease most commonly transmitted is hepatitis C, which is manifested by anorexia, nausea, vomiting, dark urine, and jaundice; the symptoms usually occur within 4 to 6 weeks after the transfusion.
 2. Other infectious agents and diseases transmitted by blood transfusion include hepatitis B virus, human immunodeficiency virus (HIV), human herpes virus type 6, Epstein-Barr virus, human T-cell leukemia, cytomegalovirus, and malaria.
 3. Donor screening has greatly reduced the risk of transmission of infectious agents; in addition, antibody testing of donors for HIV has greatly reduced the risk of transmission.
- F. Hypocalcemia
1. Citrate in transfused blood binds with **calcium** and is excreted.
 2. Assess serum calcium level before and after the transfusion.
 3. Monitor for signs of hypocalcemia (hyperactive reflexes, paresthesias, tetany, muscle cramps, positive Trousseau's sign, positive Chvostek's sign).
 4. Slow the transfusion and notify the HCP if signs of hypocalcemia occur.
- G. Hyperkalemia
1. Stored blood liberates **potassium** through hemolysis.
 2. The older the blood, the greater the risk of hyperkalemia; therefore, clients at risk for hyperkalemia, such as those with renal insufficiency or renal failure, should receive fresh blood.
 3. Assess the date on the blood and the serum potassium level before and after the transfusion.
 4. Monitor the potassium level and for signs and symptoms of hyperkalemia (paresthesias, weakness, abdominal cramps, diarrhea, and dysrhythmias).
 5. Slow the transfusion and notify the HCP if signs of hyperkalemia occur.
- H. Citrate toxicity
1. Citrate, the anticoagulant used in blood products, is metabolized by the liver.
 2. Rapid administration of multiple units of stored blood may cause hypocalcemia and hypomagnesemia when citrate binds calcium and **magnesium**; this results in citrate toxicity, causing myocardial depression and coagulopathy.
 3. Those most at risk include individuals with liver dysfunction or neonates with immature liver function.

4. Treatment includes slowing or stopping the transfusion to allow the citrate to be metabolized; hypocalcemia and hypomagnesemia are also treated with replacement therapy.

CRITICAL THINKING What Should You Do?

Answer: Signs of an immediate transfusion reaction include the following: chills and diaphoresis; muscle aches, back pain, or chest pain; rash, hives, itching, and swelling; rapid, thready pulse; dyspnea, cough, or wheezing; pallor and cyanosis; apprehension; tingling and numbness; headache; and nausea, vomiting, abdominal cramping, and diarrhea. In the event that a transfusion reaction is suspected, the nurse should first stop the infusion. The nurse should then change the intravenous (IV) tubing down to the IV site, keep the IV line open with normal saline, notify the health care provider and the blood bank, and return the blood bag and the tubing to the blood bank. The nurse should also collect a urine specimen. The nurse implements prescriptions, stays with the client, and monitors the client closely until the client is stabilized.

Reference: Ignatavicius, Workman (2016), pp. 824-825.

PRACTICE QUESTIONS

116. Packed red blood cells have been prescribed for a female client with a hemoglobin level of 7.6 g/dL (76 mmol/L) and a hematocrit level of 30% (0.30). The nurse takes the client's temperature before hanging the blood transfusion and records 100.6 °F (38.1 °C) orally. Which action should the nurse take?
1. Begin the transfusion as prescribed.
 2. Administer an antihistamine and begin the transfusion.
 3. Delay hanging the blood and notify the health care provider (HCP).
 4. Administer 2 tablets of acetaminophen and begin the transfusion.
117. The nurse has received a prescription to transfuse a client with a unit of packed red blood cells. Before explaining the procedure to the client, the nurse should ask which initial question?
1. "Have you ever had a transfusion before?"
 2. "Why do you think that you need the transfusion?"
 3. "Have you ever gone into shock for any reason in the past?"
 4. "Do you know the complications and risks of a transfusion?"
118. A client receiving a transfusion of packed red blood cells (PRBCs) begins to vomit. The client's blood pressure is 90/50 mm Hg from a baseline of 125/78 mm Hg. The client's temperature is 100.8 °F

(38.2 °C) orally from a baseline of 99.2 °F (37.3 °C) orally. The nurse determines that the client may be experiencing which complication of a blood transfusion?

1. Septicemia
2. Hyperkalemia
3. Circulatory overload
4. Delayed transfusion reaction

119. The nurse determines that a client is having a transfusion reaction. After the nurse stops the transfusion, which action should be taken next?

1. Remove the intravenous (IV) line.
2. Run a solution of 5% dextrose in water.
3. Run normal saline at a keep-vein-open rate.
4. Obtain a culture of the tip of the catheter device removed from the client.

❖ 120. The nurse has just received a unit of packed red blood cells from the blood bank for transfusion to an assigned client. The nurse is careful to select tubing especially made for blood products, knowing that this tubing is manufactured with which item? Refer to figures 1-4.

121. A client has received a transfusion of platelets. The nurse evaluates that the client is benefiting most from this therapy if the client exhibits which finding?

1. Increased hematocrit level
2. Increased hemoglobin level
3. Decline of elevated temperature to normal
4. Decreased oozing of blood from puncture sites and gums

122. The nurse has obtained a unit of blood from the blood bank and has checked the blood bag properly with another nurse. Just before beginning the transfusion, the nurse should assess which priority item?

1. Vital signs
2. Skin color
3. Urine output
4. Latest hematocrit level

123. The nurse has just received a prescription to transfuse a unit of packed red blood cells for an assigned client. What action should the nurse take next?

1. Check a set of vital signs.
2. Order the blood from the blood bank.
3. Obtain Y-site blood administration tubing.
4. Check to be sure that consent for the transfusion has been signed.

124. Following infusion of a unit of packed red blood cells, the client has developed new onset of tachycardia, bounding pulses, crackles, and wheezes. Which action should the nurse implement first?

1. Maintain bed rest with legs elevated.
2. Place the client in high-Fowler's position.
3. Increase the rate of infusion of intravenous fluids.
4. Consult with the health care provider (HCP) regarding initiation of oxygen therapy.

125. The nurse, listening to the morning report, learns that an assigned client received a unit of granulocytes the previous evening. The nurse makes a note to assess the results of which daily serum laboratory studies to assess the effectiveness of the transfusion?

1. Hematocrit level
2. Erythrocyte count
3. Hemoglobin level
4. White blood cell count

126. A client is brought to the emergency department having experienced blood loss related to an arterial laceration. Which blood component should the nurse expect the health care provider to prescribe?

1. Platelets
2. Granulocytes
3. Fresh-frozen plasma
4. Packed red blood cells

❖ 127. The nurse who is about to begin a blood transfusion knows that blood cells start to deteriorate after

a certain period of time. The nurse takes which actions in order to prevent a complication of the blood transfusion as it relates to deterioration of blood cells? Select all that apply.

- 1. Checks the expiration date
 - 2. Inspects for the presence of clots
 - 3. Checks the blood group and type
 - 4. Checks the blood identification number
 - 5. Hangs the blood within the specified time frame per agency policy
- ❖ 128. A client requiring surgery is anxious about the possible need for a blood transfusion during or after the procedure. The nurse suggests to the client to take which actions to reduce the risk of possible transfusion complications? Select all that apply.
- 1. Ask a family member to donate blood ahead of time.
 - 2. Give an autologous blood donation before the surgery.
 - 3. Take iron supplements before surgery to boost hemoglobin levels.
 - 4. Request that any donated blood be screened twice by the blood bank.
 - 5. Take adequate amounts of vitamin C several days prior to the surgery date.
129. A client with severe blood loss resulting from multiple trauma requires rapid transfusion of several units of blood. The nurse asks another health team member to obtain which device for use during the

transfusion procedure to help reduce the risk of cardiac dysrhythmias?

- 1. Infusion pump
 - 2. Pulse oximeter
 - 3. Cardiac monitor
 - 4. Blood-warming device
130. A client has a prescription to receive a unit of packed red blood cells. The nurse should obtain which intravenous (IV) solution from the IV storage area to hang with the blood product at the client's bedside?
- 1. Lactated Ringer's
 - 2. 0.9% sodium chloride
 - 3. 5% dextrose in 0.9% sodium chloride
 - 4. 5% dextrose in 0.45% sodium chloride
131. The nurse is caring for a client who is receiving a blood transfusion and is complaining of a cough. The nurse checks the client's vital signs, which include temperature of 97.2 °F (36.2 °C), pulse of 108 beats per minute, blood pressure of 152/76 mm Hg, respiratory rate of 24 breaths per minute, and an oxygen saturation level of 95% on room air. The client denies pain at this time. Based on this information, what initial action should the nurse take?
- 1. Collect a urine sample for analysis.
 - 2. Place the client in an upright position.
 - 3. Compare current data to baseline data.
 - 4. Slow the rate of the blood transfusion.

ANSWERS

116. 3

Rationale: If the client has a temperature higher than 100 °F (37.8 °C), the unit of blood should not be hung until the HCP is notified and has the opportunity to give further prescriptions. The HCP likely will prescribe that the blood be administered regardless of the temperature, or may instruct the nurse to administer prescribed acetaminophen and wait until the temperature has decreased before administration, but the decision is not within the nurse's scope of practice to make. The nurse needs an HCP's prescription to administer medications to the client.

Test-Taking Strategy: Eliminate all options that indicate to begin the transfusion, noting that they are **comparable or alike**. In addition, the options including antihistamine and acetaminophen indicate administering medication to the client, which is not done without an HCP's prescription.

Review: Nursing responsibilities related to **blood transfusion**

Level of Cognitive Ability: Synthesizing Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Safety

Reference: Lewis et al (2014), p. 677.

117. 1

Rationale: Asking the client about personal experience with transfusion therapy provides a good starting point for client teaching about this procedure. Questioning about previous history of shock and knowledge of complications and risks of transfusion is not helpful because it may elicit a fearful response from the client. Although determining whether the client knows the reason for the transfusion is important, it is not an appropriate statement in terms of eliciting information from the client regarding an understanding of the need for the transfusion.

Test-Taking Strategy: Note the **strategic word**, initial. This tells you that the correct option is the best starting point for discussion about the transfusion therapy. Eliminate the options that have emotionally laden trigger words, including gone into shock and risks, which make them incorrect. From the remaining options, focus on the **strategic word** and use **therapeutic communication techniques** to direct you to the correct option.

Review: **Blood transfusion** procedures

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment
 Content Area: Critical Care—Blood Administration
 Priority Concepts: Clinical Judgment; Safety
 References: Ignatavicius, Workman (2016), p. 117;
 Perry, Potter, Ostendorf (2014), p. 31.

118. 1

Rationale: Septicemia occurs with the transfusion of blood contaminated with microorganisms. Signs include chills, fever, vomiting, diarrhea, hypotension, and the development of shock. Hyperkalemia causes weakness, paresthesias, abdominal cramps, diarrhea, and dysrhythmias. Circulatory overload causes cough, dyspnea, chest pain, wheezing, tachycardia, and hypertension. A delayed transfusion reaction can occur days to years after a transfusion. Signs include fever, mild jaundice, and a decreased hematocrit level.

Test-Taking Strategy: Focus on the **subject**, a complication of a blood transfusion. Noting that the client's temperature is elevated will direct you to the correct option.

Review: **Complications of blood transfusions**

Level of Cognitive Ability: Synthesizing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Analysis

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Infection

Reference: Perry, Potter, Ostendorf, (2014), p. 742.

119. 3

Rationale: If the nurse suspects a transfusion reaction, the nurse stops the transfusion and infuses normal saline at a keep-vein-open rate pending further health care provider prescriptions. This maintains a patent IV access line and aids in maintaining the client's intravascular volume. The nurse would not remove the IV line because then there would be no IV access route. Obtaining a culture of the tip of the catheter device removed from the client is incorrect. First, the catheter should not be removed. Second, cultures are performed when infection, not transfusion reaction, is suspected. Normal saline is the solution of choice over solutions containing dextrose because saline does not cause red blood cells to clump.

Test-Taking Strategy: Note the **strategic word**, next. Knowing that the IV line should not be removed assists in eliminating the options directing the nurse to discontinue the device. Recalling that normal saline, not dextrose, is used when administering a unit of blood will direct you to the correct option.

Review: **Transfusion reactions**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), p. 741.

❖ 120. 3

Rationale: The tubing used for blood administration has an in-line filter. The filter helps to ensure that any particles larger than the size of the filter are caught in the filter and are not infused into the client. Tinted tubing (option 2) is incorrect because blood does not need to be protected from light. The tubing

should be macrodrip, not microdrip (option 4), to allow blood to flow freely through the drip chamber. An air vent (option 1) is unnecessary because the blood bag is not made of glass.

Test-Taking Strategy: Focus on the **subject**, intravenous tubing used to administer blood. Look at each option carefully and visualize the process of blood administration. Remember that tubing used for blood administration has an in-line filter.

Review: **Blood administration**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Safety

References: Ignatavicius, Workman (2016), p. 822;

Perry, Potter, Ostendorf (2014), p. 744.

121. 4

Rationale: Platelets are necessary for proper blood clotting. The client with insufficient platelets may exhibit frank bleeding or oozing of blood from puncture sites, wounds, and mucous membranes. Increased hemoglobin and hematocrit levels would occur when the client has received a transfusion of red blood cells. An elevated temperature would decline to normal after infusion of granulocytes because these cells were instrumental in fighting infection in the body.

Test-Taking Strategy: Use knowledge regarding the potential uses and benefits of the various types of blood product transfusions. Eliminate increased hematocrit and increased hemoglobin first because they are **comparable or alike**. From the remaining options, recalling that platelets are necessary for proper blood clotting will direct you to the correct option.

Review: **Types of blood products**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Clotting

Reference: Ignatavicius, Workman (2016), p. 824.

122. 1

Rationale: A change in vital signs during the transfusion from baseline may indicate that a transfusion reaction is occurring. This is why the nurse assesses vital signs before the procedure and again after the first 15 minutes and thereafter per agency policy. The other options do not identify assessments that are a priority just before beginning a transfusion.

Test-Taking Strategy: Note the **strategic word**, priority. This tells you that more than one of the options may be partially or totally correct and that the correct option needs to be assessed for possible comparison during the transfusion. Use the **ABCs—airway, breathing, and circulation**—to direct you to the correct option.

Review: **Blood transfusions**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Safety

References: Lewis et al. (2014), pp. 677-679;

Perry, Potter, Ostendorf (2014), p. 744.

123. 4

Rationale: After receiving a prescription for a blood transfusion, the first action the nurse should take should be to check to be sure that consent for the transfusion has been signed by the client. If the client has consented, the nurse should then check a set of vital signs to be sure there is no contraindication for a transfusion at that time, such as an elevation in temperature. If the vital signs are acceptable, the nurse can then gather supplies to administer the transfusion and order the blood from the blood bank.

Test-Taking Strategy: Note the **strategic word**, next. This word tells you that all options may be partially or totally correct, and you need to choose the best next choice. The nurse should not take any procedural steps until the client has consented to the blood transfusion.

Review: **Blood transfusions**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Critical Care—Blood Administration

Priority Concepts: Care Coordination; Health Care Law

Reference: Ignatavicius, Workman (2016), pp. 226, 822.

124. 2

Rationale: New onset of tachycardia, bounding pulses, and crackles and wheezes posttransfusion is evidence of fluid overload, a complication associated with blood transfusions. Placing the client in a high-Fowler's (upright) position will facilitate breathing. Measures that increase blood return to the heart, such as leg elevation and administration of IV fluids, should be avoided at this time. In addition, administration of fluids cannot be initiated without a prescription. Consulting with the HCP regarding administration of oxygen may be necessary, but positional changes take a short amount of time to do and should be initiated first.

Test-Taking Strategy: Note the **strategic word**, first. Apply knowledge of signs and symptoms of circulatory overload and use the **ABCs—airway, breathing, and circulation**—to assist you with selecting the priority action. Remember that placing the client in a high-Fowler's (upright) position will facilitate breathing.

Review: **Signs of circulatory overload** and associated nursing actions

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Priority Concepts: Clinical Judgment; Perfusion

Reference: Perry, Potter, Ostendorf (2014), p. 742.

125. 4

Rationale: The client who has neutropenia may receive a transfusion of granulocytes, or WBCs. These clients often have severe infections and are unresponsive to antibiotic therapy. The nurse notes the results of follow-up WBC counts and differential to evaluate the effectiveness of the therapy. The nurse also continues to monitor the client for signs and symptoms of infection. Erythrocyte count and hemoglobin and hematocrit levels are determined after transfusion of packed red blood cells.

Test-Taking Strategy: Note the **strategic word**, effectiveness. Recalling that granulocytes are a component of WBCs will assist in directing you to the correct option. In addition, note that the remaining options are **comparable or alike** in that these options all refer to red blood cells.

Review: **Types of blood products** and **granulocytes**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Critical Care—Blood Administration

Priority Concepts: Evidence; Infection

Reference: Lewis et al. (2014), p. 676.

126. 3

Rationale: Fresh-frozen plasma is often used for volume expansion as a result of fluid and blood loss. It is rich in clotting factors and can be thawed quickly and transfused quickly. Platelets are used to treat thrombocytopenia and platelet dysfunction. Granulocytes may be used to treat a client with sepsis or a neutropenic client with an infection that is unresponsive to antibiotics. Packed red blood cells are a blood product used to replace erythrocytes.

Test-Taking Strategy: Focus on the **subject**, the type of transfusion therapy for the client experiencing blood loss. Note the relationship between the words experienced blood loss and the word plasma correct option.

Review: **Fresh-frozen plasma**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Critical Care—Blood Administration

Priority Concepts: Clinical Judgment; Fluid and Electrolytes

Reference: Lewis et al. (2014), p. 676.

❖ 127. 1, 5

Rationale: The nurse notes the expiration date on the unit of blood to ensure that the blood is fresh. Blood cells begin to deteriorate over time, so safe storage usually is limited to 35 days. Careful notation of the expiration date by the nurse is an essential part of the verification process before hanging a unit of blood. The nurse also needs to hang the blood within the specified time frame after receiving it from the blood bank per agency policy to ensure that the blood being transfused is fresh. The blood bank keeps the blood regulated at a specific temperature, and therefore it must be infused within a specified time frame once received on the unit. The nurse also notes the blood identification (unit) number, blood group and type, and client's name, but this is not specifically related to the degradation of blood cells. The nurse also inspects the unit of blood for leaks, abnormal color, clots, and bubbles and returns the unit to the blood bank if clots are noted. Again, this is not related to the degradation of blood cells over time.

Test-Taking Strategy: Focus on the **subject**, measures to verify prior to blood administration. Note the word deteriorate. To answer this question correctly, you must know which part of the pretransfusion verification procedure relates to the freshness of the unit of blood. Keeping this in mind should direct you to the correct options.

Review: **Blood transfusion**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Critical Care—Blood Administration
 Priority Concepts: Clinical Judgment; Safety
 Reference: Perry, Potter, Ostendorf (2014), pp. 744-745.

❖ 128. 1, 2

Rationale: A donation of the client's own blood before a scheduled procedure is autologous. Donating autologous blood to be reinfused as needed during or after surgery reduces the risk of disease transmission and potential transfusion complications. The next most effective way is to ask a family member to donate blood before surgery. Blood banks do not provide extra screening on request. Preoperative iron supplements are helpful for iron deficiency anemia but are not helpful in replacing blood lost during the surgery. Vitamin C enhances iron absorption, but also is not helpful in replacing blood lost during surgery.

Test-Taking Strategy: Focus on the **subject**, reducing the risk of possible transfusion complications. Recalling that an autologous transfusion is the collection of the client's own blood and also that family donation of blood is usually effective will direct you to the correct options.

Review: **Blood donation procedures**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Critical Care—Blood Administration
 Priority Concepts: Anxiety; Safety
 Reference: Ignatavicius, Workman (2016), pp. 825-826.

129. 4

Rationale: If several units of blood are to be administered rapidly, a blood warmer should be used. Rapid transfusion of cool blood places the client at risk for cardiac dysrhythmias. To prevent this, the nurse warms the blood with a blood-warming device. Pulse oximetry and cardiac monitoring equipment are useful for the early assessment of complications but do not reduce the occurrence of cardiac dysrhythmias. Electronic infusion devices are not helpful in this case because the infusion must be rapid, and infusion devices generally are used to control the flow rate. In addition, not all infusion devices are made to handle blood or blood products.

Test-Taking Strategy: Note the words rapid and reduce the risk. These words tell you that the blood will infuse quickly and that the correct option is the one that will minimize the risk of cardiac dysrhythmias. Eliminate the pulse oximeter and cardiac monitor first because these items are **comparable or alike** and are used to assess for rather than reduce the risk of complications. From the remaining options, use knowledge related to the complications of transfusion therapy and note the relationship between the words several units of blood in the question and blood-warming device in the correct option.

Review: **Blood transfusions**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Planning

 Priority Concepts: Perfusion; Thermoregulation
 Reference: Lewis et al. (2014), p. 679.

130. 2

Rationale: Sodium chloride 0.9% (normal saline) is a standard isotonic solution used to precede and follow infusion of blood products. Dextrose is not used because it could result in clumping and subsequent hemolysis of red blood cells (RBCs). Lactated Ringer's is not the solution of choice with this procedure.

Test-Taking Strategy: Eliminate options that contain dextrose first because they are **comparable or alike**. From the remaining options, remember that normal saline is an isotonic solution and the solution compatible with RBCs.

Review: **Blood transfusion** procedures

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Critical Care—Blood Administration
 Priority Concepts: Clinical Judgment; Safety
 Reference: Ignatavicius, Workman (2016), p. 825.

131. 3

Rationale: For the client receiving a blood transfusion, the nurse should monitor for potential complications of a transfusion. One of the complications is circulatory overload. Signs and symptoms of circulatory overload include cough, dyspnea, chest pain, wheezing on auscultation of the lungs, headache, hypertension, tachycardia and a bounding pulse, and distended neck veins. Based on the data in the question, the nurse should compare current data to baseline data. The nurse should also further assess the client for other signs and symptoms of circulatory overload. If the nurse still suspects this complication after comparing to baseline data, the nurse should then place the client in an upright position with the feet in a dependent position and slow the rate of the infusion. Collection of a urine sample should occur if the nurse suspects a transfusion reaction, such as a hemolytic reaction.

Test-Taking Strategy: Note the **strategic word**, initial. This word indicates that some or all of the options may be partially or totally correct, but the nurse needs to prioritize. Also, **determine if an abnormality exists**. Noting that the client is complaining of cough and the vital signs are slightly abnormal should help you to determine that further assessment is needed at this time.

Review: Actions to take if a **blood transfusion complication** is suspected

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity

UNIT IV

Fundamentals of Care

Pyramid to Success

On the NCLEX-RN®, safety and infection control concepts, including standard precautions and transmission-based precautions, related to client care are a priority focus. Medication or intravenous (IV) calculation questions are also a focus on the NCLEX-RN examination. Fill-in-the-blank questions may require that you calculate a medication dose or an IV flow rate. Use the on-screen calculator for these medication and IV problems and then recheck the calculation before selecting an option or typing the answer.

The Pyramid to Success also focuses on the procedures for performing a health and physical assessment of the adult client and collecting both subjective and objective data. Perioperative nursing care and monitoring for postoperative complications is a priority. Client safety related to positioning and ambulation, and care to the client with a tube such as a gastrointestinal tube or chest tube are important concepts addressed on the NCLEX. Because many surgical procedures are performed through ambulatory care units (1-day-stay units), Pyramid Points also focus on preparing the client for discharge, teaching related to the prescribed treatments and medications, follow-up care, and the mobilization of home care support services.

Client Needs: Learning Objectives

Safe and Effective Care Environment

- Acting as an advocate regarding the client's wishes
- Collaborating with interprofessional health care members
- Ensuring environmental, personal, and home safety
- Ensuring that the client's rights, including informed consent, are upheld
- Establishing priorities of assessments and interventions
- Following advance directives regarding the client's documented requests

- Following guidelines regarding the use of safety devices
- Handling hazardous and infectious materials safely
- Informing the client of the surgical process and ensuring that informed consent for a surgical procedure and other procedures has been obtained
- Knowing the emergency response plan and actions to take for exposure to biological and chemical warfare agents
- Maintaining confidentiality
- Maintaining continuity of care and initiating referrals to home care and other support services
- Maintaining precautions to prevent errors, accidents, and injury
- Positioning the client appropriately and safely
- Preparing and administering medications, using the rights of medication administration
- Preventing a surgical infection
- Protecting the medicated client from injury
- Upholding the client's rights
- Using equipment safely
- Using ergonomic principles and body mechanics when moving a client
- Using standard and transmission-based precautions and surgical asepsis procedures

Health Promotion and Maintenance

- Assisting clients and families to identify environmental hazards in the home
- Performing home safety assessments
- Performing the techniques associated with the health and physical assessment of the client
- Providing health and wellness teaching to prevent complications
- Discussing high-risk behaviors and lifestyle choices
- Respecting lifestyle choices and health care beliefs and preferences
- Teaching clients and families about accident prevention
- Teaching clients and families about measures to be implemented in an emergency or disaster

Teaching clients and families about preventing the spread of infection and preventing diseases

Teaching the client about prescribed medication(s) or IV therapy

Psychosocial Integrity

Assessing and managing the client with sensory and perception alterations

Discussing expected body image changes and situational role changes

Facilitating client and family coping

Identifying support systems

Identifying the cultural, religious, and spiritual factors influencing health

Keeping the family informed of client progress

Providing emotional support to significant others

Physiological Integrity

Administering medications and IV therapy safely

Assessing for expected and unexpected effects of pharmacological therapy

Assessing the mobility and immobility level of the client

Assisting the client with activities of daily living

Calculating medication doses and IV flow rates

Documenting the client's response to basic life support (BLS) measures

Handling medical emergencies

Identifying client allergies and sensitivities

Identifying the adverse effects of and contraindications to medication or IV therapy

Implementing priority nursing actions in an emergency or disaster

Initiating nursing interventions when surgical complications arise

Managing and providing care to clients with infectious diseases

Monitoring for alterations in body systems

Monitoring for surgical complications

Monitoring for wound infection

Preparing for diagnostic tests to confirm accurate placement of a tube

Preventing the complications of immobility

Promoting an environment that will allow the client to express concerns

Providing comfort and assistance to the client

Providing nutrition and oral intake

Providing interventions compatible with the client's age; cultural, religious, spiritual and health care beliefs; education level; and language

Providing personal hygiene as needed

Recognizing changes in the client's condition that indicate a potential complication and intervening appropriately

Using assistive devices to prevent injury

Using special equipment

Health and Physical Assessment of the Adult Client

PRIORITY CONCEPTS Clinical Judgment; Health Promotion

CRITICAL THINKING What Should You Do?

The nurse is performing a cardiovascular assessment and notes the presence of a blowing, swishing sound over the carotid artery. What should the nurse do?
Answer located on p. 188.

I. Environment/Setting

- A. Establish a relationship and explain the procedure to the client.
- B. Ensure privacy and make the client feel comfortable (comfortable room temperature, sufficient lighting, remove distractions such as noise or objects, and avoid interruptions).
- C. Sit down for the interview (avoid barriers such as a desk), maintain an appropriate social distance, and maintain eye level.
- D. Use therapeutic communication techniques and open-ended questions to obtain information about the client's symptoms and concerns; allow time for the client to ask questions.
- E. Consider religious and cultural characteristics such as language (the need for an interpreter), values and beliefs, health practices, eye contact, and touch.
- F. Keep note-taking to a minimum so the client is the focus of attention.
- G. Types of health and physical assessments ([Box 15-1](#))

II. Health History

- A. General state of health: Body features and physical characteristics, body movements, body posture, level of consciousness, nutritional status, speech
- B. Chief complaint and history of present illness (document direct client quotes) that leads the client to seek care
- C. Family history: The health status of direct blood relatives as well as the client's spouse

D. Social history

1. Data about the client's lifestyle, with a focus on factors that may affect health
2. Information about alcohol, drug, and tobacco use; sexual practices; tattoos; body piercing; travel history; and work setting to identify occupational hazards

E. Domestic violence screening

1. Done to determine whether the client is experiencing any form of domestic violence
2. Conducted during a 1-to-1 interview with the client while obtaining the health history

III. Mental Status Exam

- A. The mental status can be assessed while obtaining **subjective data** from the client during the health history interview.
- B. Appearance
 1. Note appearance, including posture, body movements, dress, and hygiene and grooming.
 2. An inappropriate appearance and poor hygiene may be indicative of depression, manic disorder, dementia, organic brain disease, or another disorder.
- C. Behavior
 1. Level of consciousness: Assess alertness and awareness and the client's ability to interact appropriately with the environment.
 2. Facial expression and body language: Check for appropriate eye contact and determine whether facial expression and body language are appropriate to the situation; this assessment also provides information regarding the client's mood and affect.
 3. Speech: Assess speech pattern for articulation and appropriateness of conversation.
- D. Cognitive level of functioning ([Box 15-2](#))

BOX 15-1 Types of Health and Physical Assessments

Complete Assessment: Includes a complete health history and physical examination and forms a baseline database.

Focused Assessment: Focuses on a limited or short-term problem, such as the client's complaint.

Episodic/Follow-up Assessment: Focuses on evaluating a client's progress.

Emergency Assessment: Involves the rapid collection of data, often during the provision of life-saving measures.

BOX 15-2 The Mental Status Examination: Cognitive Level of Functioning

Orientation: Assess client's orientation to person, place, and time.

Attention Span: Assess client's ability to concentrate.

Recent Memory: Assessed by asking the client to recall a recent occurrence (e.g., the means of transportation used to get to the health care agency for the physical assessment).

Remote Memory: Assessed by asking the client about a verifiable past event (e.g., a vacation).

New Learning: Used to assess the client's ability to recall unrelated words identified by the nurse; the nurse selects 4 words and asks the client to recall the words 5, 10, and 30 minutes later.

Judgment: Determine whether the client's actions or decisions regarding discussions during the interview are realistic.

Thought Processes and Perceptions: The way the client thinks and what the client says should be logical, coherent, and relevant; the client should be consistently aware of reality.

IV. Physical Exam

A. Overview

1. Gather equipment needed for the examination.
2. Use the senses of sight, smell, touch, and hearing to collect data.
3. Assessment includes **inspection**, **palpation**, **percussion**, and **auscultation**; these skills are performed one at a time, in this order (except the abdominal assessment).

B. Assessment techniques

1. **Inspection**
 - a. The first assessment technique, which uses vision and smell senses while observing the client
 - b. Requires good lighting, adequate body exposure, and possibly the use of certain instruments such as an otoscope or ophthalmoscope
2. **Palpation**
 - a. Uses the sense of touch; warm the hands before touching the client.

- b. Identify tender areas and palpate them last.
- c. Start with light palpation to detect surface characteristics, and then perform deeper palpation.
- d. Light palpation is done with 1 hand by pressing the skin gently with the tips of 2 or 3 fingers held close together; deep palpation is done by placing 1 hand on top of the other and pressing down with the fingertips of both hands.
- e. Assess texture, temperature, and moisture of the skin, as well as organ location and size and symmetry if appropriate.
- f. Assess for swelling, vibration or pulsation, rigidity or spasticity, and crepitation.
- g. Assess for the presence of lumps or masses, as well as the presence of tenderness or pain.

3. Percussion

- a. Involves tapping the client's skin to assess underlying structures and to determine the presence of vibrations and sounds and, if present, their intensity, duration, pitch, quality, and location
- b. Provides information related to the presence of air, fluid, or solid masses as well as organ size, shape, and position
- c. Descriptions of findings include resonance, hyperresonance, tympany, dullness, or flatness

4. Auscultation: Involves listening to sounds produced by the body for presence and quality, such as heart, lung, or bowel sounds

C. Vital signs

1. Includes temperature, radial pulse (apical pulse may be measured during the cardiovascular assessment), respirations, blood pressure, pulse oximetry, and presence of pain (refer to [Chapter 10](#) for information on vital signs, pulse oximetry, and pain)
2. Height, weight, and nutritional status are also assessed.

V. Body Systems Assessment

A. Integumentary system: Involves inspection and palpation of skin, hair, and nails.

1. **Subjective data:** Self-care behaviors, history of skin disease, medications being taken, environmental or occupational hazards and exposure to toxic substances, changes in skin color or pigmentation, change in a mole or a sore that does not heal
2. **Objective data:** Color, temperature (hypothermia or hyperthermia); excessive dryness or moisture; skin turgor; texture (smoothness, firmness); excessive bruising, itching, rash; hair loss (alopecia) or nail abnormalities such as pitting; lesions (may be inspected with a magnifier and light or with the use of a Wood's light [ultraviolet light

used in a darkened room]); scars or birthmarks; edema; capillary filling time (Boxes 15-3 and 15-4; Table 15-1)

3. Dark-skinned client
 - a. Cyanosis: Check lips and tongue for a gray color; nail beds, palms, and soles for a blue color; and conjunctivae for pallor.
 - b. Jaundice: Check oral mucous membranes for a yellow color; check the sclera nearest to the iris for a yellow color.
 - c. Bleeding: Look for skin swelling and darkening and compare the affected side with the unaffected side.
 - d. Inflammation: Check for warmth or a shiny or taut and pitting skin area, and compare with the unaffected side.
4. Refer to Chapter 46 for diagnostic tests related to the integumentary system

! To test skin turgor, pinch a large fold of skin and assess the ability of the skin to return to its place when released. Poor turgor occurs in severe dehydration or extreme weight loss.

5. Client teaching
 - a. Provide information about factors that can be harmful to the skin, such as sun exposure.

BOX 15-3 Characteristics of Skin Color

Cyanosis: Mottled bluish coloration
 Erythema: Redness
 Pallor: Pale, whitish coloration
 Jaundice: Yellow coloration

BOX 15-4 Assessing Capillary Filling Time

1. Depress the nail bed to produce blanching.
2. Release and observe for the return of color.
3. Color will return within 3 seconds if arterial capillary perfusion is normal.

- b. Encourage performing self-examination of the skin monthly.
- B. Head, neck, and lymph nodes: Involves inspection and palpation of the head, neck, and lymph nodes
 1. Ask the client about headaches; episodes of dizziness (lightheadedness) or vertigo (spinning sensation); history of head injury; loss of consciousness; seizures; episodes of neck pain; limitations of range of motion; numbness or tingling in the shoulders, arms, or hands; lumps or swelling in the neck; difficulty swallowing; medications being taken; and history of surgery in the head and neck region.
 2. Head
 - a. Inspect and palpate: Size, shape, masses or tenderness, and symmetry of the skull
 - b. Palpate temporal arteries, located above the cheekbone between the eye and the top of the ear.
 - c. Temporomandibular joint: Ask the client to open his or her mouth; note any crepitation, tenderness, or limited range of motion.
 - d. Face: Inspect facial structures for shape, symmetry, involuntary movements, or swelling, such as periorbital edema (swelling around the eyes).
 3. Neck
 - a. Inspect for symmetry of accessory neck muscles.
 - b. Assess range of motion.
 - c. Test cranial nerve XI (spinal accessory nerve) to assess muscle strength: Ask the client to push against resistance applied to the side of the chin (tests sternocleidomastoid muscle); also ask the client to shrug the shoulders against resistance (tests trapezius muscle).
 - d. Palpate the trachea: It should be midline, without any deviations.
 - e. Thyroid gland: Inspect the neck as the client takes a sip of water and swallows (thyroid tissue moves up with a swallow); palpate using an anterior-posterior approach

TABLE 15-1 Pitting Edema Scale

Scale	Description	“Measurement”*
1+	A barely perceptible pit	2 mm ($\frac{3}{32}$ in)
2+	A deeper pit, rebounds in a few seconds	4 mm ($\frac{6}{32}$ in)
3+	A deep pit, rebounds in 10-20 sec	6 mm ($\frac{1}{4}$ in)
4+	A deeper pit, rebounds in > 30 sec	8 mm ($\frac{5}{16}$ in)

*“Measurement” is in quotation marks because depth of edema is rarely actually measured but is included as a frame of reference.

Data from Wilson AF, Giddens JF: Health assessment for nursing practice, ed 5, St. Louis, 2013, Mosby. Description column data from Kirton C: Assessing edema, Nursing 96 26(7):54, 1996.

(usually the normal adult thyroid cannot be palpated); if it is enlarged, auscultate for a bruit.

4. Lymph nodes
 - a. Palpate using a gentle pressure and a circular motion of the finger pads.
 - b. Begin with the preauricular lymph nodes (in front of the ear); move to the posterior auricular lymph nodes and then downward toward the supraclavicular lymph nodes.
 - c. Palpate with both hands, comparing the 2 sides for symmetry.
 - d. If nodes are palpated, note their size, shape, location, mobility, consistency, and tenderness.
5. Client teaching: Instruct the client to notify the health care provider (HCP) if persistent headache, dizziness, or neck pain occurs; if swelling or lumps are noted in the head and neck region; or if a neck or head injury occurs.

 **Neck movements are never performed if the client has sustained a neck injury or if a neck injury is suspected.**

C. Eyes: Includes inspection, palpation, vision-testing procedures, and the use of an ophthalmoscope

1. Subjective data: Difficulty with vision (e.g., decreased acuity, double vision, blurring, blind spots); pain, redness, swelling, watery or other discharge from the eye; use of glasses or contact lenses; medications being taken; history of eye problems
2. Objective data
 - a. Inspect the external eye structures, including eyebrows, for symmetry; eyelashes for even distribution; eyelids for ptosis (drooping); eyeballs for exophthalmos (protrusion) or enophthalmos (recession into the orbit; sunken eye).
 - b. Inspect the conjunctiva (should be clear), sclera (should be white), and lacrimal apparatus (check for excessive tearing, redness, tenderness, or swelling); cornea and lens (should be smooth and clear); iris (should be flat, with a round regular shape and even coloration); eyelids; and pupils
3. Snellen eye chart
 - a. The Snellen eye chart is a simple tool used to measure distance vision.
 - b. Position the client in a well-lit spot 20 feet (6 meters) from the chart, with the chart at eye level, and ask the client to read the smallest line that he or she can discern.
 - c. Instruct the client to leave on glasses or leave in contact lenses; if the glasses are for reading only, they are removed because they blur distance vision.

- d. Test 1 eye at a time.
- e. Record the result using the fraction at the end of the last line successfully read on the chart.
- f. Normal visual acuity is 20/20 (distance in feet at which the client is standing from the chart/distance in feet at which a normal eye could have read that particular line).

4. Near vision
 - a. Use a hand-held vision screener (held about 14 inches [35.5 centimeters] from the eye) that contains various sizes of print or ask the client to read from a magazine.
 - b. Test each eye separately with the client's glasses on or contact lenses in.
 - c. Normal result is 14/14 (distance in inches at which the subject holds the card from the eye/distance in inches at which a normal eye could have read that particular line).
5. Confrontation test
 - a. A crude but rapid test used to measure peripheral vision and compare the client's peripheral vision with the nurse's (assuming that the nurse's peripheral vision is normal)
 - b. The client covers 1 eye and looks straight ahead; the nurse, positioned 2 feet away (60 centimeters), covers his or her eye opposite the client's covered eye.
 - c. The nurse advances a finger or other small object from the periphery from several directions; the client should see the object at the same time the nurse does.
6. Corneal light reflex
 - a. Used to assess for parallel alignment of the axes of the eyes
 - b. Client is asked to gaze straight ahead as the nurse holds a light about 12 inches (30 centimeters) from the client.
 - c. The nurse looks for reflection of the light on the corneas in exactly the same spot in each eye.
7. Cover test
 - a. Used to check for slight degrees of deviated alignment
 - b. Each eye is tested separately.
 - c. The nurse asks the client to gaze straight ahead and cover 1 eye.
 - d. The nurse examines the uncovered eye, expecting to note a steady, fixed gaze.
8. Extraocular muscle function (6 cardinal positions of gaze) ([Fig. 15-1](#))
 - a. The 6 muscles that attach the eyeball to its orbit and serve to direct the eye to points of interest are tested.
 - b. Client holds head still and is asked to move his or her eyes and follow a small object.
 - c. The examiner notes any parallel movements of the eye or nystagmus, an involuntary, rhythmic, rapid twitching of the eyeballs.

FIGURE 15-1 Checking extraocular muscles in the 6 cardinal positions. This indicates the functioning of cranial nerves III, IV, and VI.

9. Color vision

- Tests for color vision involve picking numbers or letters out of a complex and colorful picture.
- The Ishihara chart is used for testing and consists of numbers composed of colored dots located within a circle of colored dots.
- The client is asked to read the numbers on the chart.
- Each eye is tested separately.
- Reading the numbers correctly indicates normal color vision.
- The test is sensitive for the diagnosis of red-green blindness but cannot detect discrimination of blue.

! The first slide on the Ishihara chart is one that everyone can discriminate; failure to identify numbers on this slide suggests a problem with performing the test, not a problem with color vision.

10. Pupils (Box 15-5)

- The pupils are round and of equal size.
- Increasing light causes pupillary constriction.

BOX 15-5 Assessing and Documenting Pupillary Responses

Pupillary Light Reflex

- Darken the room (to dilate the client's pupils) and ask the client to look forward.
- Test each eye.
- Advance a light in from the side to note constriction of the same-side pupil (direct light reflex) and simultaneous constriction of the other pupil (consensual light reflex).

Accommodation

- Ask the client to focus on a distant object (dilates the pupil).
- Ask the client to shift gaze to a near object held about 3 inches (7.5 centimeters) from the nose.
- Normal response includes pupillary constriction and convergence of the axes of the eyes.

Documenting Normal Findings: PERRLA

P $\frac{1}{4}$ pupils
E $\frac{1}{4}$ equal
R $\frac{1}{4}$ round
RL $\frac{1}{4}$ reactive to light
A $\frac{1}{4}$ reactive to accommodation

- Decreasing light causes pupillary dilation.
- Constriction of both pupils is a normal response to direct light.

11. Sclera and cornea

- Normal sclera color is white.
- A yellow color to the sclera may indicate jaundice or systemic problems.
- In a dark-skinned person, the sclera may normally appear yellow; pigmented dots may be present.
- The cornea is transparent, smooth, shiny, and bright.
- Cloudy areas or specks on the cornea may be the result of an accident or eye injury.

12. Ophthalmoscopy

- The ophthalmoscope is an instrument used to examine the external structures and the interior of the eye.
- The room is darkened so that the pupil will dilate.
- The instrument is held with the right hand when examining the right eye and with the left hand when examining the left eye.
- The client is asked to look straight ahead at an object on the wall.
- The examiner should approach the client's eye from about 12 to 15 inches (30.5 to 38 centimeters) away and 15 degrees lateral to the client's line of vision.
- As the instrument is directed at the pupil, a red glare (red reflex) is seen in the pupil.
- The red reflex is the reflection of light on the vascular retina.
- Absence of the red reflex may indicate opacity of the lens.
- The retina, optic disc, optic vessels, fundus, and macula can be examined.

13. Refer to Chapter 60 for diagnostic tests related to the eye.

14. Client teaching

- Instruct the client to notify the HCP if alterations in vision occur or any redness, swelling, or drainage from the eye is noted.
- Inform the client of the importance of regular eye examinations.

D. Ears: Includes inspection, palpation, hearing tests, vestibular assessment, and the use of an otoscope

- Subjective data: Difficulty hearing, earaches, drainage from the ears, dizziness, ringing in the ears, exposure to environmental noise, use of a hearing aid, medications being taken, history of ear problems or infections
- Objective data
 - Inspect and palpate the external ear, noting size, shape, symmetry, skin color, and the presence of pain.

- b. Inspect the external auditory meatus for size, swelling, redness, discharge, and foreign bodies; some cerumen (earwax) may be present.
3. Auditory assessment
 - a. Sound is transmitted by air conduction and bone conduction.
 - b. Air conduction takes 2 or 3 times longer than bone conduction.
 - c. Hearing loss is categorized as conductive, sensorineural, or mixed conductive and sensorineural.
 - d. Conductive hearing loss is caused by any physical obstruction to the transmission of sound waves.
 - e. Sensorineural hearing loss is caused by a defect in the cochlea, eighth cranial nerve, or the brain itself.
 - f. A mixed hearing loss is a combination of a conductive and sensorineural hearing loss; it results from problems in both the inner ear and the outer ear or middle ear.
4. Voice (Whisper) test
 - a. Used to determine whether hearing loss has occurred
 - b. One ear is tested at a time (the ear not being tested is occluded by the client).
 - c. The nurse stands 1 to 2 feet (30 to 60 centimeters) from the client, covers his or her mouth so that the client cannot read the lips, exhales fully, and softly whispers 2-syllable words in the direction of the unoccluded ear; the client points a finger up during the test when the nurse's voice is heard (a ticking watch may also be used to test hearing acuity).
 - d. Failure to hear the sounds could indicate possible fluid collection and/or consolidation, requiring further assessment.
5. Watch test
 - a. A ticking watch is used to test for high-frequency sounds.
 - b. The examiner holds a ticking watch about 5 inches (12.5 centimeters) from each ear and asks the client if the ticking is heard.
6. Tuning fork tests
 - a. Used to measure hearing on the basis of air conduction or bone conduction; includes the Weber and Rinne tests
 - b. To activate the tuning fork, the nurse holds the base and lightly taps the tines against the other hand, setting the fork in vibration.
7. Weber test
 - a. Determines whether the client has a conductive or sensorineural hearing loss
 - b. Stem of the vibrating tuning fork is placed in the midline of the client's skull and the client is asked if the tone sounds the same in both ears or better in 1 ear.
- c. The client hears the tone by bone conduction and the sound should be heard equally in both ears.
 - d. In conductive loss, the sound travels toward the impaired ear.
 - e. In sensorineural loss, the sound travels toward the good ear.
8. Rinne test
 - a. Stem of the vibrating tuning fork is placed on the client's mastoid process.
 - b. When the client no longer hears the sound, the tuning fork is quickly inverted and placed near the ear canal; the client should still hear a sound.
 - c. Normally the sound is heard twice as long by way of air conduction (AC) (near the ear canal) than by way of bone conduction (BC) (at the mastoid process); $AC > BC$.
 - d. In sensorineural hearing loss, air conduction is heard longer than bone conduction, but it is not heard to be twice as long.
 - e. In conductive hearing loss, the bone conduction sound is longer than or equal to the air conduction sound.
9. Vestibular assessment ([Box 15-6](#))
10. Otoscopic exam

 Before performing an otoscopic exam and inserting the speculum, check the auditory canal for foreign bodies. Instruct the client not to move the head during the examination to avoid damage to the canal and tympanic membrane.

 - a. The client's head is tilted slightly away and the otoscope is held upside down as if it were a large pen; this permits the examiner's hand to lay against the client's head for support.
 - b. In an adult, pull the pinna up and back to straighten the external canal.
 - c. Visualize the external canal while slowly inserting the speculum.
 - d. The normal external canal is pink and intact, without lesions and with varying amounts of cerumen and fine little hairs.
 - e. Assess the tympanic membrane for intactness; the normal tympanic membrane is intact, without perforations, and should be free from lesions.
 - f. The tympanic membrane is transparent, opaque, pearly gray, and slightly concave.
 - g. A fluid line or the presence of air bubbles is not normally visible.
 - h. If the tympanic membrane is bulging or retracting, the edges of the light reflex will be fuzzy (diffuse) and may spread over the tympanic membrane.

BOX 15-6 Vestibular Assessment**Test for Falling**

1. The examiner asks the client to stand with the feet together, arms hanging loosely at the sides, and eyes closed.
2. The client normally remains erect, with only slight swaying.
3. A significant sway is a positive Romberg sign.

Test for Past Pointing

1. The client sits in front of the examiner.
2. The client closes the eyes and extends the arms in front, pointing both index fingers at the examiner.
3. The examiner holds and touches his or her own extended index fingers under the client's extended index fingers to give the client a point of reference.
4. The client is instructed to raise both arms and then lower them, attempting to return to the examiner's extended index fingers.
5. The normal test response is that the client can easily return to the point of reference.
6. The client with a vestibular function problem lacks a normal sense of position and cannot return the extended fingers to the point of reference; instead, the fingers deviate to the right or left of the reference point.

Gaze Nystagmus Evaluation

1. The client's eyes are examined as the client looks straight ahead, 30 degrees to each side, upward and downward.
2. Any spontaneous nystagmus—an involuntary, rhythmic, rapid twitching of the eyeballs—represents a problem with the vestibular system.

Dix-Hallpike Maneuver

1. The client starts in a sitting position; the examiner lowers the client to the exam table and rather quickly turns the client's head to the 45-degree position.
2. If after about 30 seconds there is no nystagmus, the client is returned to a sitting position and the test is repeated on the other side.

 **The otoscope is never introduced blindly into the external canal because of the risk of perforating the tympanic membrane.**

11. Refer to Chapter 60 for diagnostic tests related to the ear.

12. Client teaching

- a. Instruct the client to notify the HCP if an alteration in hearing or ear pain or ringing in the ears occurs, or if redness, swelling, or drainage from the ear is noted.
- b. Instruct the client in the proper method of cleaning the ear canal.
- c. The client should cleanse the ear canal with the corner of a moistened washcloth and should never insert sharp objects or cotton-tipped applicators into the ear canal.

E. Nose, mouth, and throat: Includes inspection and palpation

1. Subjective data

- a. Nose: Ask about discharge or nosebleed (epistaxis), facial or sinus pain, history of frequent colds, altered sense of smell, allergies, medications being taken, history of nose trauma or surgery.
- b. Mouth and throat: Ask about the presence of sores or lesions; bleeding from the gums or elsewhere; altered sense of taste; toothaches; use of dentures or other appliances; tooth and mouth care hygiene habits; at-risk behaviors (e.g., smoking, alcohol consumption); and history of infection, trauma, or surgery.

2. Objective data

- a. External nose should be midline and in proportion to other facial features.
- b. Patency of the nostrils can be tested by pushing each nasal cavity closed and asking the client to sniff inward through the other nostril.
- c. Anasal speculum and penlight or a short, wide-tipped speculum attached to an otoscope head is used to inspect for redness, swelling, discharge, bleeding, or foreign bodies; the nasal septum is assessed for deviation.
- d. The nurse presses the frontal sinuses (located below the eyebrows) and over the maxillary sinuses (located below the cheekbones); the client should feel firm pressure but no pain.
- e. The external and inner surfaces of the lips are assessed for color, moisture, cracking, or lesions.
- f. The teeth are inspected for condition and number (should be white, spaced evenly, straight, and clean, free of debris and decay).
- g. The alignment of the upper and lower jaw is assessed by having the client bite down.
- h. The gums are inspected for swelling, bleeding, discoloration, and retraction of gingival margins (gums normally appear pink).
- i. The tongue is inspected for color, surface characteristics, moisture, white patches, nodules, and ulcerations (dorsal surface is normally rough; ventral surface is smooth and glistening, with visible veins).
- j. The nurse retracts the cheek with a tongue depressor to check the buccal mucosa for color and the presence of nodules or lesions; normal mucosa is glistening, pink, soft, moist, and smooth.
- k. Using a penlight and tongue depressor, the nurse inspects the hard and soft palates for color, shape, texture, and defects; the hard palate (roof of the mouth), which is located anteriorly, should be white and dome-shaped, and the soft palate, which extends posteriorly, should be light pink and smooth.

- l. The uvula is inspected for midline location; the nurse asks the client to say “ahhh” and watches for the soft palate and uvula to rise in the midline (this tests 1 function of cranial nerve X, the vagus nerve).
 - m. Using a penlight and tongue depressor, the nurse inspects the throat for color, presence of tonsils, and the presence of exudate or lesions; 1 technique to test cranial nerve XII (the hypoglossal nerve) is asking the client to stick out the tongue (should protrude in the midline).
 - n. To test the gag reflex, touch the posterior pharynx with the end of a tongue blade; the client should gag momentarily (this tests the function of cranial nerve IX, the glossopharyngeal nerve).
3. Client teaching
 - a. Emphasize the importance of hygiene and tooth care, as well as regular dental examinations and the use of fluoridated water or fluoride supplements.
 - b. Encourage the client to avoid at-risk behaviors (e.g., smoking, alcohol consumption).
 - c. Stress the importance of reporting pain or abnormal occurrence (e.g., nodules, lesions, signs of infection).

F. Lungs

1. Subjective data: Cough; expectoration of sputum; shortness of breath or dyspnea; chest pain on breathing; smoking history; environmental exposure to pollution or chemicals; medications being taken; history of respiratory disease or infection; last tuberculosis test, chest radiograph, pneumonia, and any influenza immunizations. Record the smoking history in pack-years (the number of packs per day times the number of years smoked). For example, a client who has smoked one-half pack a day for 20 years has a 10–pack-year smoking history.
2. Objective data: Includes inspection, palpation, percussion, and auscultation
3. Inspection of the anterior and posterior chest: Note skin color and condition and the rate and quality of respirations, look for lumps or lesions, note the shape and configuration of the chest wall, and note the position the client takes to breathe.
4. Palpation: Palpate the entire chest wall, noting skin temperature and moisture and looking for areas of tenderness and lumps, lesions, or masses; assess chest excursion and tactile or vocal fremitus (Box 15-7).
5. Percussion
 - a. Starting at the apices, percuss across the top of the shoulders, moving to the interspaces,

BOX 15-7 Palpation of the Chest

Chest Excursion

Posterior: The nurse places the thumbs along the spinal processes at the 10th rib, with the palms in light contact with the posterolateral surfaces.

The nurse’s thumbs should be about 2 inches (5 centimeters) apart, pointing toward the spine, with the fingers pointing laterally.

Anterior: The nurse places the hands on the anterolateral wall with the thumbs along the costal margins, pointing toward the xiphoid process.

The nurse instructs the client to take a deep breath after exhaling.

The nurse should note movement of the thumbs and chest excursion should be symmetrical, separating the thumbs approximately 2 inches (5 centimeters).

Tactile or Vocal Fremitus

The nurse places the ball or lower palm of the hand over the chest, starting at the lung apices and palpating from side to side.

The nurse asks the client to repeat the words “ninety-nine.” Symmetrical palpable vibration should be felt by the nurse.

making a side-to-side comparison all the way down the lung area (Fig. 15-2).

- b. Determine the predominant note; resonance is noted in healthy lung tissue.
 - c. Hyperresonance is noted when excessive air is present and a dull note indicates lung density.
6. Auscultation
 - a. Using the flat diaphragm endpiece of the stethoscope, hold it firmly against the chest wall, and listen to at least 1 full respiration in each location (anterior, posterior, and lateral).
 - b. Posterior: Start at the apices and move side to side for comparison (see Fig. 15-2).
 - c. Anterior: Auscultate the lung fields from the apices in the supraclavicular area down to the 6th rib; avoid percussion and auscultation over female breast tissue (displace this tissue) because a dull sound will be produced (see Fig. 15-2).
 - d. Compare findings on each side.
 7. Normal breath sounds: Three types of breath sounds are considered normal in certain parts of the thorax, including vesicular, bronchovesicular, and bronchial; breath sounds should be clear to auscultation (Fig. 15-3).
 8. Abnormal breath sounds: Also known as adventitious sounds (Table 15-2)
 9. Voice sounds (Box 15-8)
 - a. Performed when a pathological lung condition is suspected

FIGURE 15-2 Landmarks for chest auscultation and percussion. A, Posterior view. B, Anterior view. C, Lateral views.

FIGURE 15-3 Auscultatory sounds. A, Anterior thorax. B, Posterior thorax.

TABLE 15-2 Characteristics of Adventitious Sounds

Adventitious Sound	Characteristics	Clinical Examples
Crackles (previously called rales)		
Fine crackles	High-pitched crackling and popping noises (discontinuous sounds) heard during the end of inspiration. Not cleared by cough	Maybe heard in pneumonia, heart failure, asthma, and restrictive pulmonary diseases
Medium crackles	Medium-pitched, moist sound heard about halfway through inspiration. Not cleared by cough	Same as above, but condition is worse
Coarse crackles	Low-pitched, bubbling or gurgling sounds that start early in inspiration and extend into the first part of expiration	Same as above, but condition is worse or may be heard in terminally ill clients with diminished gag reflex. Also heard in pulmonary edema and pulmonary fibrosis
Wheeze (also called sibilant wheeze)	High-pitched, musical sound similar to a squeak. Heard more commonly during expiration, but may also be heard during inspiration. Occurs in small airways	Heard in narrowed airway diseases such as asthma
Rhonchi (also called sonorous wheeze)	Low-pitched, coarse, loud, low snoring or moaning tone. Actually sounds like snoring. Heard primarily during expiration, but may also be heard during inspiration. Coughing may clear	Heard in disorders causing obstruction of the trachea or bronchus, such as chronic bronchitis
Pleural friction rub	A superficial, low-pitched, coarse rubbing or grating sound. Sounds like 2 surfaces rubbing together. Heard throughout inspiration and expiration. Loudest over the lower anterolateral surface. Not cleared by cough	Heard in individuals with pleurisy (inflammation of the pleural surfaces)

Data from Wilson AF, Giddens JF: Health assessment for nursing practice, ed 5, St. Louis, 2013, Mosby.

BOX 15-8 Voice Sounds

Bronchophony

1. Ask the client to repeat the words “ninety-nine.”
2. Normal voice transmission is soft, muffled, and indistinct.

Egophony

1. Ask the client to repeat a long “ee-ee-ee” sound.
2. Normally the nurse would hear the “ee-ee-ee” sound.

Whispered Pectoriloquy

1. Ask the client to whisper the word “ninety-nine.”
2. Normal voice transmission is faint, muffled, and almost inaudible.

- b. Auscultate over the chest wall; the client is asked to vocalize words or a phrase while the nurse listens to the chest.
- c. Normal voice transmission is soft and muffled; the nurse can hear the sound but is unable to distinguish exactly what is being said.

 **When auscultating breath sounds, instruct the client to breathe through the mouth and monitor the client for dizziness.**

10. Refer to Chapter 54 for diagnostic tests related to the respiratory system.

11. Client teaching

- a. Encourage the client to avoid exposure to environmental hazards, including smoking

(discuss smoking cessation programs as appropriate).

- b. Client should undergo periodic examinations as prescribed (e.g., chest x-ray study, tuberculosis skin testing; refer to Chapter 54).
- c. Encourage the client to obtain pneumonia and influenza immunizations.
- d. HCP should be notified if client experiences persistent cough, shortness of breath, or other respiratory symptoms.

G. Heart and peripheral vascular system

1. Subjective data: Chest pain, dyspnea, cough, fatigue, edema, nocturia, leg pain or cramps (claudication), changes in skin color, obesity, medications being taken, cardiovascular risk factors, family history of cardiac or vascular problems, personal history of cardiac or vascular problems
2. Objective data: May include inspection, palpation, percussion, and auscultation
3. Inspection: Inspect the anterior chest for pulsations (apical impulse) created as the left ventricle rotates against the chest wall during systole; not always visible.
4. Palpation
 - a. Palpate the apical impulse at the fourth or fifth interspace, or medial to the midclavicular line (not palpable in obese clients or clients with thick chest walls).
 - b. Palpate the apex, left sternal border, and base for pulsations; normally none are present.

5. Percussion: May be performed to outline the heart's borders and to check for cardiac enlargement (denoted by resonance over the lung and dull notes over the heart).
6. Auscultation
 - a. Areas of the heart (Fig. 15-4)
 - b. Auscultate heart rate and rhythm; check for a pulse deficit (auscultate the apical heartbeat while palpating an artery) if an irregularity is noted.
 - c. Assess S1 (“lub”) and S2 (“dub”) sounds, and listen for extra heart sounds, as well as the presence of murmurs (blowing or swooshing noise that can be faint or loud with a high, medium, or low pitch).
7. Peripheral vascular system
 - a. Assess adequacy of blood flow to the extremities by palpating arterial pulses for equality and symmetry and checking the condition of the skin and nails.
 - b. Check for pretibial edema and measure calf circumference (see Table 15-1).
 - c. Measure blood pressure.
 - d. Palpate superficial inguinal nodes (using firm but gentle pressure), beginning in the inguinal area and moving down toward the inner thigh.
 - e. An ultrasonic stethoscope may be needed to amplify the sounds of a pulse wave if the pulse cannot be palpated.
 - f. Carotid artery: Located in the groove between the trachea and sternocleidomastoid muscle, medial to and alongside the muscle
 - g. Palpate 1 carotid artery at a time to avoid compromising blood flow to the brain.
 - h. Auscultate each carotid artery for the presence of a bruit (a blowing, swishing, or buzzing, humming sound), which indicates blood

flow turbulence; normally a bruit is not present.

- i. Palpate the arteries in the extremities (Box 15-9).
8. Refer to Chapter 56 for diagnostic tests related to the cardiovascular system.
9. Client teaching
 - a. Advise client to modify lifestyle for risk factors associated with heart and vascular disease.
 - b. Encourage the client to seek regular physical examinations.
 - c. Client should seek medical assistance for signs of heart or vascular disease.
- H. Breasts
 1. Subjective data: Pain or tenderness, lumps or thickening, swollen axillary lymph nodes, nipple discharge, rash or swelling, medications being taken, personal or family history of breast disease, trauma or injury to the breasts, previous surgery on the breasts, breast self-examination (BSE) compliance, mammograms as prescribed
 2. Objective data: Inspection and palpation
 3. Inspection
 - a. Performed with the client's arms raised above the head, the hands pressed against the hips, and the arms extended straight ahead while the client sits and leans forward
 - b. Assess size and symmetry (1 breast is often larger than the other); masses, flattening,

FIGURE 15-4 Auscultation areas of the heart. LICS, Left intercostal space; LMCL, left midclavicular line; RICS, right intercostal space.

BOX 15-9 Arterial Pulse Points and Grading the Force of Pulses

Arteries in the Arms and Hands

Radial Pulse: Located at the radial side of the forearm at the wrist

Ulnar Pulse: Located on the opposite side of the location of the radial pulse at the wrist

Brachial Pulse: Located above the elbow at the antecubital fossa, between the biceps and triceps muscles

Arteries in the Legs

Femoral Pulse: Located below the inguinal ligament, midway between the symphysis pubis and the anterosuperior iliac spine

Popliteal Pulse: Located behind the knee

Dorsalis Pedis Pulse: Located at the top of the foot, in line with the groove between the extensor tendons of the great and first toes

Posterior Tibial Pulse: Located on the inside of the ankle, behind and below the medial malleolus (ankle bone)

Grading the Force

4+¼ Strong and bounding

3+¼ Full pulse, increased

2+¼ Normal, easily palpable

1+¼ Weak, barely palpable

retraction, or dimpling; color and venous pattern; size, color, shape, and discharge in the nipple and areola; and the direction in which nipples point.

4. Palpation

- Client lies supine, with the arm on the side being examined behind the head and a small pillow under the shoulder.
- The nurse uses the pads of the first 3 fingers to compress the breast tissue gently against the chest wall, noting tissue consistency.
- Palpation is performed systematically, ensuring that the entire breast and tail are palpated.
- The nurse notes the consistency of the breast tissue, which normally feels dense, firm, and elastic.
- The nurse gently palpates the nipple and areola and compresses the nipple, noting any discharge.

5. Axillary lymph nodes

- The nurse faces the client and stands on the side being examined, supporting the client's arm in a slightly flexed position, and abducts the arm away from the chest wall.
- The nurse places the free hand against the client's chest wall and high in the axillary hollow, then, with the fingertips, gently presses down, rolling soft tissue over the surface of the ribs and muscles.
- Lymph nodes are normally not palpable.

6. Client teaching

- Encourage and teach the client to perform BSE (refer to Chapter 48 for information on performing BSE).
- Client should report lumps or masses to the HCP immediately.
- Regular physical examinations and mammograms should be obtained as prescribed.

I. Abdomen

- Subjective data: Changes in appetite or weight, difficulty swallowing, dietary intake, intolerance to certain foods, nausea or vomiting, pain, bowel habits, medications currently being taken, history of abdominal problems or abdominal surgery
- Objective data

- Ask the client to empty the bladder.
- Be sure to warm the hands and the endpiece of the stethoscope.
- Examine painful areas last.

 **When performing an abdominal assessment, the specific order for assessment techniques is inspection, auscultation, percussion, and palpation.**

3. Inspection

- Contour: Look down at the abdomen and then across the abdomen from the rib margin

to the pubic bone; describe as flat, rounded, concave, or protuberant.

- Symmetry: Note any bulging or masses.
- Umbilicus: Should be midline and inverted
- Skin surface: Should be smooth and even
- Pulsations from the aorta may be noted in the epigastric area, and peristaltic waves may be noted across the abdomen.

4. Auscultation

- Performed before percussion and palpation, which can increase peristalsis.
- Hold the stethoscope lightly against the skin and listen for bowel sounds in all 4 quadrants; begin in the right lower quadrant (bowel sounds are normally heard here).
- Note the character and frequency of normal bowel sounds: high-pitched gurgling sounds occurring irregularly from 5 to 30 times a minute.
- Identify as normal, hypoactive, or hyperactive (borborygmus).
- Absent sounds: Auscultate for 5 minutes before determining that sounds are absent.
- Auscultate over the aorta, renal arteries, iliac arteries, and femoral arteries for vascular sounds or bruits.

5. Percussion

- All 4 quadrants are percussed lightly.
- Borders of the liver and spleen are percussed.
- Tympany should predominate over the abdomen, with dullness over the liver and spleen.
- Percussion over the kidney at the 12th rib (costovertebral angle) should produce no pain.

6. Palpation

- Begin with light palpation of all 4 quadrants, using the fingers to depress the skin about 1 cm; next perform deep palpation, depressing 5 to 8 cm.
- Palpate the liver and spleen (spleen may not be palpable).
- Palpate the aortic pulsation in the upper abdomen slightly to the left of midline; normally it pulsates in a forward direction (pulsation expands laterally if an aneurysm is present).

- Refer to Chapter 52 for diagnostic tests related to the gastrointestinal system.

8. Client teaching

- Encourage the client to consume a balanced diet; obesity needs to be prevented.
- Substances that can cause gastric irritation should be avoided.
- The regular use of laxatives is discouraged.
- Lifestyle behaviors that can cause gastric irritation (e.g., spicy foods) should be modified.
- Regular physical examinations are important.

f. The client should report gastrointestinal problems to the HCP.

J. Musculoskeletal system

1. Subjective data: Joint pain or stiffness; redness, swelling, or warm joints; limited motion of joints; muscle pain, cramps, or weakness; bone pain; limitations in activities of daily living; exercise patterns; exposure to occupational hazards (e.g., heavy lifting, prolonged standing or sitting); medications being taken; history of joint, muscle, or bone injuries; history of surgery of the joints, muscles, or bones
2. Objective data: Inspection and palpation
3. Inspection: Inspect gait and posture, and for cervical, thoracic, and lumbar curves ([Box 15-10](#)).
4. Palpation: Palpate all bones, joints, and surrounding muscles.
5. Range of motion
 - a. Perform active and passive range-of-motion exercises of each major joint.
 - b. Check for pain, limited mobility, spastic movement, joint instability, stiffness, and contractures.
 - c. Normally joints are nontender, without swelling, and move freely.
6. Muscle tone and strength
 - a. Assess during measurement of range of motion.
 - b. Ask client to flex the muscle to be examined and then to resist while applying opposing force against the flexion.
 - c. Assess for increased tone (hypertonicity) or little tone (hypotonicity).
7. Grading muscle strength ([Table 15-3](#))
8. Refer to Chapter 64 for diagnostic tests related to the musculoskeletal system.
9. Client teaching
 - a. The client should consume a balanced diet, including foods containing calcium and vitamin D.
 - b. Activities that cause muscle strain or stress to the joints should be avoided.
 - c. Encourage the client to maintain a normal weight.
 - d. Participation in a regular exercise program is beneficial.
 - e. The client should contact the HCP if joint or muscle pain or problems occur or if limitations in range of motion or muscle strength develop.

TABLE 15-3 Criteria for Grading and Recording Muscle Strength

Functional Level	Lovett Scale	Grade	Percentage of Normal
No evidence of contractility	Zero (0)	0	0
Evidence of slight contractility	Trace (T)	1	10
Complete range of motion with gravity eliminated	Poor (P)	2	25
Complete range of motion with gravity	Fair (F)	3	50
Complete range of motion against gravity with some resistance	Good (G)	4	75
Complete range of motion against gravity with full resistance	Normal (N)	5	100

Data from Wilson AF, Giddens JF: Health assessment for nursing practice, ed 5, St. Louis, 2013, Mosby.

K. Neurological system

1. Subjective data: Headaches, dizziness or vertigo, tremors, weakness, incoordination, numbness or tingling in any area of the body, difficulty speaking or swallowing, medications being taken, history of seizures, history of head injury or surgery, exposure to environmental or occupational hazards (e.g., chemicals, alcohol, drugs)
2. Objective data: Assessment of cranial nerves, level of consciousness, pupils, motor function, cerebellar function, coordination, sensory function, and reflexes
3. Note mental and emotional status, behavior and appearance, language ability, and intellectual functioning, including memory, knowledge, abstract thinking, association, and judgment.
4. Vital signs: Check temperature, pulse, respirations, and blood pressure; monitor for blood pressure or pulse changes, which may indicate increased intracranial pressure (see Chapter 62 for abnormal respiratory patterns).
5. Cranial nerves ([Table 15-4](#))
6. Level of consciousness
 - a. Assess the client's behavior to determine level of consciousness (e.g., alertness, confusion, delirium, unconsciousness, stupor, coma); assessment becomes increasingly invasive as the client is less responsive.
 - b. Speak to client.
 - c. Assess appropriateness of behavior and conversation.
 - d. Lightly touch the client (as culturally appropriate).

BOX 15-10 Common Postural Abnormalities

Lordosis (Swayback): Increased lumbar curvature
 Kyphosis (Hunchback): Exaggeration of the posterior curvature of the thoracic spine
 Scoliosis: Lateral spinal curvature

TABLE 15-4 Assessment of the Cranial Nerves

Cranial Nerve	Test
Cranial Nerve I: Olfactory <ul style="list-style-type: none"> ■ Sensory ■ Controls the sense of smell 	<ul style="list-style-type: none"> ■ Have the client close the eyes and occlude 1 nostril with a finger ■ Ask the client to identify nonirritating and familiar odors (e.g., coffee, tea, cloves, soap, chewing gum, peppermint) ■ Repeat the test on the other nostril
Cranial Nerve II: Optic <ul style="list-style-type: none"> ■ Sensory ■ Controls vision 	<ul style="list-style-type: none"> ■ Assess visual acuity with a Snellen chart and perform an ophthalmoscopic exam ■ Check peripheral vision by confrontation ■ Check color vision
Cranial Nerves III, IV, and VI Cranial Nerve III: Oculomotor <ul style="list-style-type: none"> ■ Motor ■ Controls pupillary constriction, upper-eyelid elevation, and most eye movement Cranial Nerve IV: Trochlear <ul style="list-style-type: none"> ■ Motor ■ Controls downward and inward eye movement Cranial Nerve VI: Abducens <ul style="list-style-type: none"> ■ Motor ■ Controls lateral eye movement 	<ul style="list-style-type: none"> ■ The motor functions of cranial nerves III, IV, and VI overlap; therefore, they should be tested together ■ Inspect the eyelids for ptosis (drooping); then assess ocular movements and note any eye deviation ■ Test accommodation and direct and consensual light reflexes
Cranial Nerve V: Trigeminal <ul style="list-style-type: none"> ■ Sensory and motor ■ Controls sensation in the cornea, nasal and oral mucosa, and facial skin, as well as mastication 	<ul style="list-style-type: none"> ■ To test motor function, ask the client to clench the teeth and assess the muscles of mastication; then try to open the client's jaws after asking the client to keep them tightly closed ■ The corneal reflex may be tested by the health care provider; this is done by lightly touching the client's cornea with a cotton wisp (this test may be omitted if the client is alert and blinking normally) ■ Check sensory function by asking the client to close the eyes; lightly touch forehead, cheeks, and chin, noting whether the touch is felt equally on the 2 sides
Cranial Nerve VII: Facial <ul style="list-style-type: none"> ■ Sensory and motor ■ Controls movement of the face and taste sensation 	<ul style="list-style-type: none"> ■ Test taste perception on the anterior two thirds of the tongue; the client should be able to taste salty and sweet tastes ■ Have the client smile, frown, and show the teeth ■ Ask the client to puff out the cheeks ■ Attempt to close the client's eyes against resistance
Cranial Nerve VIII: Acoustic or Vestibulocochlear <ul style="list-style-type: none"> ■ Sensory ■ Controls hearing and vestibular function 	<ul style="list-style-type: none"> ■ Assessing the client's ability to hear tests the cochlear portion ■ Assessing the client's sense of equilibrium tests the vestibular portion ■ Check the client's hearing, using acuity tests ■ Observe the client's balance and watch for swaying when he or she is walking or standing ■ Assessment of sensorineural hearing loss may be done with the Weber or Rinne test
Cranial Nerves IX and X Cranial Nerve IX: Glossopharyngeal <ul style="list-style-type: none"> ■ Sensory and motor ■ Controls swallowing ability, sensation in the pharyngeal soft palate and tonsillar mucosa, taste perception on the posterior third of the tongue, and salivation Cranial Nerve X: Vagus <ul style="list-style-type: none"> ■ Sensory and motor ■ Controls swallowing and phonation, sensation in the exterior ear's posterior wall, and sensation behind the ear ■ Controls sensation in the thoracic and abdominal viscera 	<ul style="list-style-type: none"> ■ Usually cranial nerves IX and X are tested together ■ Test taste perception on the posterior one third of the tongue or pharynx; the client should be able to taste bitter and sour tastes ■ Inspect the soft palate and watch for symmetrical elevation when the client says "aaah" ■ Touch the posterior pharyngeal wall with a tongue depressor to elicit the gag reflex

Continued

TABLE 15-4 Assessment of the Cranial Nerves—cont'd

Cranial Nerve	Test
Cranial Nerve XI: Spinal Accessory	
<ul style="list-style-type: none"> ■ Motor ■ Controls strength of neck and shoulder muscles 	<ul style="list-style-type: none"> ■ The nurse palpates and inspects the sternocleidomastoid muscle as the client pushes the chin against the nurse's hand ■ The nurse palpates and inspects the trapezius muscle as the client shrugs the shoulders against the nurse's resistance
Cranial Nerve XII: Hypoglossal	
<ul style="list-style-type: none"> ■ Motor ■ Controls tongue movements involved in swallowing and speech 	<ul style="list-style-type: none"> ■ Observe the tongue for asymmetry, atrophy, deviation to 1 side, and fasciculations (uncontrollable twitching); ask the client to stick out the tongue (tongue should be midline) ■ Ask the client to push the tongue against a tongue depressor, and then have the client move the tongue rapidly in and out and from side to side

7. Pupils

- a. Assess size, equality, and reaction to light (brisk, slow, or fixed) and note any unusual eye movements (check direct light and consensual light reflex); refer to Chapter 62 for abnormal pupillary findings
- b. This component of the neurological examination may be performed during assessment of the eye.

8. Motor function

- a. Assess muscle tone, including strength and equality.
- b. Assess for voluntary and involuntary movements and purposeful and nonpurposeful movements.
- c. This component of the neurological examination may be performed during assessment of the musculoskeletal system.

9. Cerebellar function

- a. Monitor gait as the client walks in a straight line, heel to toe (tandem walking).
- b. Romberg test: Client is asked to stand with the feet together and the arms at the sides and to close the eyes and hold the position; normally the client can maintain posture and balance.
- c. If appropriate, ask the client to perform a shallow knee bend or to hop in place on 1 leg and then the other.

10. Coordination

- a. Assess by asking the client to perform rapid alternating movements of the hands (e.g., turning the hands over and patting the knees continuously).
- b. The nurse asks the client to touch the nurse's finger, then his or her own nose; the client keeps the eyes open and the nurse moves the finger to different spots to ensure that the client's movements are smooth and accurate.
- c. Heel-to-shin test: Assist the client into a supine position, then ask the client to place the heel on the opposite knee and run it

down the shin; normally the client moves the heel down the shin in a straight line.

11. Sensory function

- a. Pain: Assess by applying an object with a sharp point and one with a dull point to the client's body in random order; ask the client to identify the sharp and dull feelings.
- b. Light touch: Brush a piece of cotton over the client's skin at various locations in a random order and ask the client to say when the touch is felt.
- c. Vibration: Use a tuning fork to test the client's ability to feel vibrations over bony prominences; ask the client to announce when the vibration starts and stops.
- d. Position sense (kinesthesia): Move the client's finger or toe up or down and ask the client which way it has been moved; this tests the client's ability to perceive passive movement.
- e. Stereognosis: Tests the client's ability to recognize objects placed in his or her hand
- f. Graphesthesia: Tests the client's ability to identify a number traced on the client's hand
- g. Two-point discrimination: Tests the client's ability to discriminate 2 simultaneous pinpricks on the skin

12. Deep tendon reflexes

- a. Includes testing the following reflexes: biceps, triceps, brachioradialis, patella, Achilles
- b. Limb should be relaxed.
- c. The tendon is tapped quickly with a reflex hammer, which should cause contraction of muscle.
- d. Scoring deep tendon reflex activity (**Box 15-11**)

13. Plantar reflex

- a. A cutaneous (superficial) reflex is tested with a pointed but not sharp object.
- b. The sole of the client's foot is stroked from the heel, up the lateral side, and then across the ball of the foot to the medial side.
- c. The normal response is plantar flexion of all toes.

BOX 15-11 Scoring Deep Tendon Reflex Activity

- 0 ¼ No response
- 1+¼ Sluggish or diminished
- 2+¼ Active or expected response
- 3+¼ Slightly hyperactive, more brisk than normal; not necessarily pathological
- 4+¼ Brisk, hyperactive with intermittent clonus associated with disease

Data from Wilson AF, Giddens JF: Health assessment for nursing practice, ed 5, St. Louis, 2013, Mosby.

 **Dorsiflexion of the great toe and fanning of the other toes (Babinski's sign) is abnormal in anyone older than 2 years and indicates the presence of central nervous system disease indicating an upper motor neuron lesion.**

14. Testing for meningeal irritation

- a. A positive Brudzinski's sign or Kernig's sign indicates meningeal irritation.
- b. Brudzinski's sign is tested with the client in the supine position. The nurse flexes the client's head (gently moves the head to the chest) and there should be no reports of pain or resistance to the neck flexion; a positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.
- c. Kernig's sign is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended.

15. Refer to Chapter 62 for additional neurological assessments and diagnostic tests.

16. Client teaching

- a. Client should avoid exposure to environmental hazards (e.g., insecticides, lead).
- b. High-risk behaviors that can result in head and spinal cord injuries should be avoided.
- c. Protective devices (e.g., a helmet, body pads) should be worn when participating in high-risk behaviors.
- d. Seat belts should always be worn.

L. Female genitalia and reproductive tract

1. Subjective data: Urinary difficulties or symptoms such as frequency, urgency, or burning; vaginal discharge; pain; menstrual and obstetrical histories; onset of menopause; medications being taken; sexual activity and the use of contraceptives; history of sexually transmitted infections

2. Objective data

- a. Use a calm and relaxing approach; the examination is embarrassing for many women and may be a difficult experience for an adolescent.

- b. Consider the client's cultural background and her beliefs regarding examination of the genitalia.
- c. A complete examination will include the external genitalia and a vaginal examination.
- d. The nurse's role is to prepare the client for the examination and to assist the HCP, nurse practitioner, or nurse midwife.
- e. The client is asked to empty her bladder before the examination.
- f. The client is placed in the lithotomy position, and a drape is placed across the client.

3. External genitalia

- a. Quantity and distribution of hair
- b. Characteristics of labia majora and minora (make note of any inflammation, edema, lesions, or lacerations)
- c. Urethral orifice is observed for color and position.
- d. Vaginal orifice (introitus) is inspected for inflammation, edema, discoloration, discharge, and lesions.
- e. The examiner may check Skene's and Bartholin's glands for tenderness or discharge (if discharge is present, color, odor, and consistency are noted and a culture of the discharge is obtained).
- f. The client is assessed for the presence of a cystocele (in which a portion of the vaginal wall and bladder prolapse, or fall, into the orifice anteriorly) or a rectocele (bulging of the posterior wall of the vagina caused by prolapse of the rectum).

4. Speculum examination of the internal genitalia

- a. Performed by the HCP, nurse practitioner, or nurse midwife
- b. Permits visualization of the cervix and vagina
- c. Papanicolaou (Pap) smear (test): A painless screening test for cervical cancer is done; the specimen is obtained during the speculum examination, and the nurse helps to prepare the specimen for laboratory analysis.

5. Client teaching

- a. Stress the importance of personal hygiene.
- b. Explain the purpose and recommended frequency of Pap tests.
- c. Explain the signs of sexually transmitted infections.
- d. Educate the client on measures to prevent a sexually transmitted infection.
- e. Inform the client with a sexually transmitted infection that she must inform her sexual partner(s) of the need for an examination.

M. Male genitalia

1. Subjective data: Urinary difficulty (e.g., frequency, urgency, hesitancy or straining, dysuria, nocturia); pain, lesions, or discharge on or from

the penis; pain or lesions in the scrotum; medications being taken; sexual activity and the use of contraceptives; history of sexually transmitted infections

2. Objective data
 - a. Includes assessment (inspection and palpation) of the external genitalia and inguinal ring and canal
 - b. Client may stand or lie down for this examination.
 - c. Genitalia are manipulated gently to avoid causing erection or discomfort.
 - d. Sexual maturity is assessed by noting the size and shape of the penis and testes, the color and texture of the scrotal skin, and the character and distribution of pubic hair.
 - e. The penis is checked for the presence of lesions or discharge; a culture is obtained if a discharge is present.
 - f. The scrotum is inspected for size, shape, and symmetry (normally the left testicle hangs lower than the right) and is palpated for the presence of lumps.
 - g. Inguinal ring and canal; inspection (asking the client to bear down) and palpation are performed to assess for the presence of a hernia.
3. Client teaching
 - a. Stress the importance of personal hygiene.
 - b. Teach the client how to perform testicular self-examination (TSE); a day of the month is selected and the exam is performed on the same day each month after a shower or bath when the hands are warm and soapy and the scrotum is warm. (Refer to Chapter 48 for information on performing TSE.)
 - c. Explain the signs of sexually transmitted infections.
 - d. Educate the client on measures to prevent sexually transmitted infections.
 - e. Inform the client with a sexually transmitted infection that he must inform his sexual partner(s) of the need for an examination.

N. Rectum and anus

1. Subjective data: Usual bowel pattern; any change in bowel habits; rectal pain, bleeding from the rectum, or black or tarry stools; dietary habits; problems with urination; previous screening for colorectal cancer; medications being taken; history of rectal or colon problems; family history of rectal or colon problems
2. Objective data
 - a. Examination can detect colorectal cancer in its early stages; in men, the rectal examination can also detect prostate tumors.

- b. Women may be examined in the lithotomy position after examination of the genitalia.
- c. A man is best examined by having the client bend forward with his hips flexed and upper body resting over the examination table.
- d. A nonambulatory client may be examined in the left lateral (Sims') position.
- e. The external anus is inspected for lumps or lesions, rashes, inflammation or excoriation, scars, or hemorrhoids.
- f. Digital examination will most likely be performed by the HCP or nurse practitioner.
- g. Digital examination is performed to assess sphincter tone; to check for tenderness, irregularities, polyps, masses, or nodules in the rectal wall; and to assess the prostate gland.
- h. The prostate gland is normally firm, without boggy, tenderness, or nodules (hardness or nodules may indicate the presence of a cancerous lesion).
3. Client teaching
 - a. Diet should include high-fiber and low-fat foods and plenty of liquids.
 - b. The client should obtain regular digital examinations.
 - c. The client should be able to identify the symptoms of colorectal cancer or prostatic cancer (men).
 - d. The client should follow the American Cancer Society's guidelines for screening for colorectal cancer.

VI. Documenting Health and Physical Assessment Findings

- A. Documentation of findings may be either written or recorded electronically (depending on agency protocol).
- B. Whether written or electronic, the documentation is a legal document and a permanent record of the client's health status.
- C. Principles of documentation need to be followed and data need to be recorded accurately, concisely, completely, legibly, and objectively without bias or opinions; always follow agency protocol for documentation.
- D. Documentation findings serve as a source of client information for other health care providers; procedures for maintaining confidentiality are always followed.
- E. Record findings about the client's health history and physical examination as soon as possible after completion of the health assessment.
- F. Refer to [Chapter 6](#) for additional information about documentation guidelines.

CRITICAL THINKING What Should You Do?

Answer: The carotid arteries are located in the groove between the trachea and sternocleidomastoid muscle, medial to and alongside the muscle. On assessment, the nurse should palpate 1 carotid artery at a time to avoid compromising blood flow to the brain. On auscultation, the nurse listens for the presence of a bruit (a blowing, swishing sound), which indicates blood flow turbulence. Normally a bruit is not present, so this finding necessitates the need for follow-up. Both carotid arteries should be auscultated. The nurse should notify the health care provider if a bruit is detected. The nurse should also document the findings.

Reference: Ignatavicius, Workman (2016), p. 639.

PRACTICE QUESTIONS

132. A Spanish-speaking client arrives at the triage desk in the emergency department and states to the nurse, “No speak English, need interpreter.” Which is the best action for the nurse to take?
1. Have one of the client’s family members interpret.
 2. Have the Spanish-speaking triage receptionist interpret.
 3. Page an interpreter from the hospital’s interpreter services.
 4. Obtain a Spanish-English dictionary and attempt to triage the client.
133. The nurse is performing a neurological assessment on a client and elicits a positive Romberg’s sign. The nurse makes this determination based on which observation?
1. An involuntary rhythmic, rapid, twitching of the eyeballs
 2. A dorsiflexion of the ankle and great toe with fanning of the other toes
 3. A significant sway when the client stands erect with feet together, arms at the side, and the eyes closed
 4. A lack of normal sense of position when the client is unable to return extended fingers to a point of reference
134. The nurse notes documentation that a client is exhibiting Cheyne-Stokes respirations. On assessment of the client, the nurse should expect to note which finding?
1. Rhythmic respirations with periods of apnea
 2. Regular rapid and deep, sustained respirations
 3. Totally irregular respiration in rhythm and depth
 4. Irregular respirations with pauses at the end of inspiration and expiration
135. A client diagnosed with conductive hearing loss asks the nurse to explain the cause of the hearing problem. The nurse plans to explain to the client that this condition is caused by which problem?
1. A defect in the cochlea
 2. A defect in cranial nerve VIII
 3. A physical obstruction to the transmission of sound waves
 4. A defect in the sensory fibers that lead to the cerebral cortex
136. While performing a cardiac assessment on a client with an incompetent heart valve, the nurse auscultates a murmur. The nurse documents the finding and describes the sound as which?
1. Lub-dub sounds
 2. Scratchy, leathery heart noise
 3. A blowing or swooshing noise
 4. Abrupt, high-pitched snapping noise
137. The nurse is testing the extraocular movements in a client to assess for muscle weakness in the eyes. The nurse should implement which assessment technique to assess for muscle weakness in the eye?
1. Test the corneal reflexes.
 2. Test the 6 cardinal positions of gaze.
 3. Test visual acuity, using a Snellen eye chart.
 4. Test sensory function by asking the client to close the eyes and then lightly touching the forehead, cheeks, and chin.
138. The nurse is instructing a client how to perform a testicular self-examination (TSE). The nurse should explain that which is the best time to perform this exam?
1. After a shower or bath
 2. While standing to void
 3. After having a bowel movement
 4. While lying in bed before arising
139. The nurse is assessing a client for meningeal irritation and elicits a positive Brudzinski’s sign. Which finding did the nurse observe?
1. The client rigidly extends the arms with pronated forearms and plantar flexion of the feet.
 2. The client flexes a leg at the hip and knee and reports pain in the vertebral column when the leg is extended.
 3. The client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.
 4. The client’s upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated.

140. A client with a diagnosis of asthma is admitted to the hospital with respiratory distress. Which type of adventitious lung sounds should the nurse expect to hear when performing a respiratory assessment on this client?
1. Stridor
 2. Crackles
 3. Wheezes
 4. Diminished
- ❖ 141. The clinic nurse prepares to perform a focused assessment on a client who is complaining of

symptoms of a cold, a cough, and lung congestion. Which should the nurse include for this type of assessment? Select all that apply.

- 1. Auscultating lung sounds
- 2. Obtaining the client's temperature
- 3. Assessing the strength of peripheral pulses
- 4. Obtaining information about the client's respirations
- 5. Performing a musculoskeletal and neurological examination
- 6. Asking the client about a family history of any illness or disease

ANSWERS

132. 3

Rationale: The best action is to have a professional hospital-based interpreter translate for the client. English-speaking family members may not appropriately understand what is asked of them and may paraphrase what the client is actually saying. Also, client confidentiality as well as accurate information may be compromised when a family member or a non-health care provider acts as interpreter.

Test-Taking Strategy: Note the **strategic word**, best. Initially focus on what the client needs. In this case the client needs and asks for an interpreter. Next keep in mind the issue of confidentiality and making sure that information is obtained in the most efficient and accurate way. This will assist in eliminating options 1, 2, and 4.

133. 3

Rationale: In Romberg's test, the client is asked to stand with the feet together and the arms at the sides, and to close the eyes and hold the position; normally the client can maintain posture and balance. A positive Romberg's sign is a vestibular neurological sign that is found when a client exhibits a loss of balance when closing the eyes. This may occur with cerebellar ataxia, loss of proprioception, and loss of vestibular function. A lack of normal sense of position coupled with an inability to return extended fingers to a point of reference is a finding that indicates a problem with coordination. A positive gaze nystagmus evaluation results in an involuntary rhythmic, rapid twitching of the eyeballs. A positive Babinski's test results in dorsiflexion of the ankle and great toe with fanning of the other toes; if this occurs in anyone older than 2 years it indicates the presence of central nervous system disease.

Test-Taking Strategy: Note the **subject**, Romberg's sign. You can easily answer this question if you can recall that the client's balance is tested in this test.

Review: **Romberg's test**

Jarvis (2016), p. 650.

134. 1

Rationale: Cheyne-Stokes respirations are rhythmic respirations with periods of apnea and can indicate a metabolic dysfunction in the cerebral hemisphere or basal ganglia. Neurogenic hyperventilation is a regular, rapid and deep, sustained respiration that can indicate a dysfunction in the low midbrain and middle pons. Ataxic respirations are totally irregular in rhythm and depth and indicate a dysfunction in the medulla. Apneustic respirations are irregular respirations with pauses at the end of inspiration and expiration and can indicate a dysfunction in the middle or caudal pons.

Test-Taking Strategy: Focus on the **subject**, the characteristics of Cheyne-Stokes respirations. Recalling that periods of apnea occur with this type of respiration will help direct you to the correct answer.

135. 3

Rationale: A conductive hearing loss occurs as a result of a physical obstruction to the transmission of sound waves. A sensorineural hearing loss occurs as a result of a pathological process in the inner ear, a defect in cranial nerve VIII, or a defect of the sensory fibers that lead to the cerebral cortex.

Test-Taking Strategy: Focus on the **subject**, a conductive hearing loss. Noting the relationship of the word conductive in the question and transmission in the correct option will direct you to this option.

Review: **Conductive hearing loss** and **sensorineural hearing loss**

136. 3

Rationale: A heart murmur is an abnormal heart sound and is described as a faint or loud blowing, swooshing sound with a high, medium, or low pitch. Lub-dub sounds are normal and represent the S1 (first) heart sound and S2 (second) heart sound, respectively. A pericardial friction rub is described as a scratchy, leathery heart sound. A click is described as an abrupt, high-pitched snapping sound.

Test-Taking Strategy: Focus on the **subject**, characteristics of a murmur. Eliminate option 1 because it describes normal heart sounds. Next recall that a murmur occurs as a result of the manner in which the blood is flowing through the cardiac chambers and valves. This will direct you to the correct option.

Review: **Heart murmur**

 Jarvis (2016), pp. 464, 506.

137. 2

Rationale: Testing the 6 cardinal positions of gaze is done to assess for muscle weakness in the eyes. The client is asked to hold the head steady, and then to follow movement of an object through the positions of gaze. The client should follow the object in a parallel manner with the 2 eyes. A Snellen eye chart assesses visual acuity and cranial nerve II (optic). Testing sensory function by having the client close his or her eyes and then lightly touching areas of the face and testing the corneal reflexes assess cranial nerve V (trigeminal).

Test-Taking Strategy: Focus on the **subject**, assessing for muscle weakness in the eyes. Note the relationship between the words extraocular movements in the question and positions of gaze in the correct option.

Review: Physical assessment techniques for **muscle weakness in the eyes**

 Jarvis (2016), p. 313.

138. 1

Rationale: The nurse needs to teach the client how to perform a TSE. The nurse should instruct the client to perform the exam on the same day each month. The nurse should also instruct the

client that the best time to perform a TSE is after a shower or bath when the hands are warm and soapy and the scrotum is warm. Palpation is easier and the client will be better able to identify any abnormalities. The client would stand to perform the exam, but it would be difficult to perform the exam while voiding. Having a bowel movement is unrelated to performing a TSE. Test-Taking Strategy: Note the **strategic word**, best. Think about the purpose of this test and visualize this assessment technique to answer correctly.

Review: **Testicular self-examination**

Level of Cognitive Ability: Applying
 Client Needs: Health Promotion and Maintenance

 Physical Exam
 Priority Concepts: Client Education; Sexuality
 References: Ignatavicius, Workman (2016), p. 1513;
 Jarvis (2016), pp. 704-705.

139. 3

Rationale: Brudzinski's sign is tested with the client in the supine position. The nurse flexes the client's head (gently moves the head to the chest) and there should be no reports of pain or resistance to the neck flexion. A positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column. Kernig's sign also tests for meningeal irritation and is positive when the client flexes the legs at the hip and knee and complains of pain along the vertebral column when the leg is extended. Decorticate posturing is abnormal flexion and is noted when the client's upper arms are flexed and held tightly to the sides of the body and the legs are extended and internally rotated. Decerebrate posturing is abnormal extension and occurs when the arms are fully extended, forearms pronated, wrists and fingers flexed, jaws clenched, neck extended, and feet plantar-flexed.

Test-Taking Strategy: Focus on the **subject**, a positive Brudzinski's sign. Recalling that a positive sign is elicited if the client reports pain will assist in eliminating options 1 and 4. Next it is necessary to know that a positive Brudzinski's sign is observed if the client passively flexes the hip and knee in response to neck flexion and reports pain in the vertebral column.

Review: **Brudzinski's sign**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment

 Physical Exam
 Priority Concepts: Clinical Judgment; Intracranial Regulation
 Reference: Jarvis (2016), p. 688.

140. 3

Rationale: Asthma is a respiratory disorder characterized by recurring episodes of dyspnea, constriction of the bronchi, and wheezing. Wheezes are described as high-pitched musical sounds heard when air passes through an obstructed or narrowed lumen of a respiratory passageway. Stridor is a harsh sound noted with an upper airway obstruction and often signals a life-threatening emergency. Crackles are produced by air passing over retained airway secretions or fluid, or the sudden opening of collapsed

airways. Diminished lung sounds are heard over lung tissue where poor oxygen exchange is occurring.

Test-Taking Strategy: Note the **subject**, assessment of abnormal lung sounds. Note the client's diagnosis and think about the pathophysiology that occurs in this disorder. Recalling that bronchial constriction occurs will assist in directing you to the correct option. Also, thinking about the definition of each adventitious lung sound identified in the options will direct you to the correct option.

Review: **Adventitious lung sounds**

Physical Exam

Priority Concepts: Clinical Judgment; Gas Exchange

References: Ignatavicius, Workman (2016), pp. 506-507; Jarvis (2016), p. 447.

❖ 141. 1, 2, 4

Rationale: A focused assessment focuses on a limited or short-term problem, such as the client's complaint. Because the client is complaining of symptoms of a cold, a cough, and lung

congestion, the nurse would focus on the respiratory system and the presence of an infection. A complete assessment includes a complete health history and physical examination and forms a baseline database. Assessing the strength of peripheral pulses relates to a vascular assessment, which is not related to this client's complaints. A musculoskeletal and neurological examination also is not related to this client's complaints. However, strength of peripheral pulses and a musculoskeletal and neurological examination would be included in a complete assessment. Likewise, asking the client about a family history of any illness or disease would be included in a complete assessment.

Test-Taking Strategy: Focus on the **subject** and note the words focused assessment. Noting that the client's symptoms relate to the respiratory system and the presence of an infection will direct you to the correct options.

CHAPTER 16

Provision of a Safe Environment

PRIORITY CONCEPTS Infection, Safety

CRITICAL THINKING What Should You Do?

The nurse is working in a long-term care facility that has a “no restraint policy.” An assigned client is disoriented and unsteady and continually attempts to climb out of bed. What should the nurse do with regard to instituting safety precautions for this client?

Answer located on p. 199.

I. Environmental Safety

A. Fire safety (see [Priority Nursing Actions](#))

⚡ PRIORITY NURSING ACTIONS

Event of a Fire

1. Rescue clients who are in immediate danger.
2. Activate the fire alarm.
3. Confine the fire.
4. Extinguish the fire.
 - a. Obtain the fire extinguisher.
 - b. Pull the pin on the fire extinguisher.
 - c. Aim at the base of the fire.
 - d. Squeeze the extinguisher handle.
 - e. Sweep the extinguisher from side to side to coat the area of the fire evenly.

Remember the mnemonic RACE to prioritize in the event of a fire. R is rescue clients in immediate danger, A is alarm (sound the alarm), C is confine the fire by closing all doors, and E is extinguish. To properly use the fire extinguisher, remember the mnemonic PASS to prioritize in the use of a fire extinguisher. P is pull the pin, A is aim at the base of the fire, S is squeeze the handle, and S is sweep from side to side to coat the area evenly.

Reference

Perry, Potter, Ostendorf (2014), pp. 313-314.

1. Keep open spaces free of clutter.
2. Clearly mark fire exits.
3. Know the locations of all fire alarms, exits, and extinguishers ([Table 16-1](#); also see [Priority Nursing Actions](#)).
4. Know the telephone number for reporting fires.
5. Know the fire drill and evacuation plan of the agency.
6. Never use the elevator in the event of a fire.
7. Turn off oxygen and appliances in the vicinity of the fire.
8. In the event of a fire, if a client is on life support, maintain respiratory status manually with an Ambu bag (resuscitation bag) until the client is moved away from the threat of the fire and can be placed back on life support.
9. In the event of a fire, ambulatory clients can be directed to walk by themselves to a safe area and, in some cases, may be able to assist in moving clients in wheelchairs.
10. Bedridden clients generally are moved from the scene of a fire by stretcher, their bed, or wheelchair.
11. If a client must be carried from the area of a fire, appropriate transfer techniques need to be used.
12. If fire department personnel are at the scene of the fire, they will help to evacuate clients.

! Remember the mnemonic RACE (Rescue clients, Activate the fire alarm, Confine the fire, Extinguish the fire) to set priorities in the event of a fire and the mnemonic PASS (Pull the pin, Aim at the base of the fire, Squeeze the handle, Sweep from side to side) to use a fire extinguisher.

B. Electrical safety

1. Electrical equipment must be maintained in good working order and should be grounded; otherwise, it presents a **physical hazard**.
2. Use a 3-pronged electrical cord.

TABLE 16-1 Types of Fire Extinguishers

Type	Class of Fire
A	Wood, cloth, upholstery, paper, rubbish, plastic
B	Flammable liquids or gases, grease, tar, oil-based paint
C	Electrical equipment

3. In a 3-pronged electrical cord, the third, longer prong of the cord is the ground; the other 2 prongs carry the power to the piece of electrical equipment.
4. Check electrical cords and outlets for exposed, frayed, or damaged wires.
5. Avoid overloading any circuit.
6. Read warning labels on all equipment; never operate unfamiliar equipment.
7. Use safety extension cords only when absolutely necessary, and tape them to the floor with electrical tape.
8. Never run electrical wiring under carpets.
9. Never pull a plug by using the cord; always grasp the plug itself.
10. Never use electrical appliances near sinks, bathtubs, or other water sources.
11. Always disconnect a plug from the outlet before cleaning equipment or appliances.
12. If a client receives an electrical shock, turn off the electricity before touching the client.

 **Any electrical equipment that the client brings into the health care facility must be inspected for safety before use.**

C. Radiation safety

1. Know the protocols and guidelines of the health care agency.
2. Label potentially radioactive material.
3. To reduce exposure to radiation, do the following.
 - a. Limit the time spent near the source.
 - b. Make the distance from the source as great as possible.
 - c. Use a shielding device such as a lead apron.
4. Monitor radiation exposure with a film (dosimeter) badge.
5. Place the client who has a radiation implant in a private room.
6. Never touch dislodged radiation implants.
7. Keep all linens in the client's room until the implant is removed.

D. Disposal of infectious wastes

1. Handle all infectious materials as a hazard.
2. Dispose of waste in designated areas only, using proper containers for disposal.
3. Ensure that infectious material is labeled properly.

4. Dispose of all sharps immediately after use in closed, puncture-resistant disposal containers that are leak-proof and labeled or color-coded.

 **Needles (sharps) should not be recapped, bent, or broken because of the risk of accidental injury (needle stick).**

- E. Physiological changes in the older client that increase the risk of accidents ([Box 16-1](#))
- F. Risk for falls assessment
 1. Should be client-centered and include the use of a fall risk scale per agency procedures
 2. Include the client's own perceptions of their risk factors for falls and their method to adapt to these factors. Areas of concern may include gait stability, muscle strength and coordination, balance, and vision.
 3. Assess for any previous accidents.
 4. Assess with the client any concerns about their immediate environment, including stairs, use of throw rugs, grab bars, or a raised toilet seat.
 5. Review the medications that the client is taking that could have a side or adverse effect or side/adverse effects that could place the client at risk for a fall.
 6. Determine any scheduled procedures that pose risks to the client.
- G. Measures to prevent falls ([Box 16-2](#))
- H. Measures to promote safety in ambulation for the client

BOX 16-1 Physiological Changes in Older Clients That Increase the Risk of Accidents

Musculoskeletal Changes

Strength and function of muscles decrease. Joints become less mobile and bones become brittle. Postural changes and limited range of motion occur.

Nervous System Changes

Voluntary and autonomic reflexes become slower. Decreased ability to respond to multiple stimuli occurs. Decreased sensitivity to touch occurs.

Sensory Changes

Decreased vision and lens accommodation and cataracts develop. Delayed transmission of hot and cold impulses occurs. Impaired hearing develops, with high-frequency tones less perceptible.

Genitourinary Changes

Increased nocturia and occurrences of incontinence may occur.

Adapted from Potter A, Perry P, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby; and Touhy T, Jett K: Ebersole and Hess' toward healthy aging, ed 8, St. Louis, 2012, Mosby.

BOX 16-2 Measures to Prevent Falls

- Assess the client's risk for falling.
- Assign the client at risk for falling to a room near the nurses' station.
- Alert all personnel to the client's risk for falling.
- Assess the client frequently.
- Orient the client to physical surroundings.
- Instruct the client to seek assistance when getting up.
- Explain the use of the nurse call system.
- Use safety devices such as floor pads, and bed or chair alarms that alert health care personnel of the person getting out of bed or a chair.
- Keep the bed in the low position with side rails adjusted to a safe position (follow agency policy).
- Lock all beds, wheelchairs, and stretchers.
- Keep clients' personal items within their reach.
- Eliminate clutter and obstacles in the client's room.
- Provide adequate lighting.
- Reduce bathroom hazards.
- Maintain the client's toileting schedule throughout the day.

BOX 16-3 Steps to Prevent Injury to the Health Care Worker When Moving a Client

- Use available safety equipment.
- Keep the weight to be lifted as close to the body as possible.
- Bend at the knees.
- Tighten abdominal muscles and tuck the pelvis.
- Maintain the trunk erect and knees bent so that multiple muscle groups work together in a coordinated manner.

Adapted from Potter A, Perry P, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby.

1. Gait belt may be used to keep the center of gravity midline.
 - a. Place the belt on the client prior to ambulation.
 - b. Encircle the client's waist with the belt.
 - c. Hold on to the side or back of the belt so that the client does not lean to 1 side.
 - d. Return the client to bed or a nearby chair if the client develops dizziness or becomes unsteady.

I. Steps to prevent injury to the health care worker (Box 16-3)

J. Restraints (safety devices)

1. Restraints (safety devices) are protective devices used to limit the physical activity of a client or to immobilize a client or an extremity.
 - a. The agency policy should be checked when applying side rails.
 - b. The use of side rails is not considered a restraint when they are used to prevent a sedated client from falling out of bed.

- c. The client must be able to exit the bed easily in case of an emergency when using side rails. Only the top 2 side rails should be used.
 - d. The bed must be kept in the lowest position when using side rails.
2. Physical restraints restrict client movement through the application of a device.
3. Chemical restraints are medications given to inhibit a specific behavior or movement.
4. Interventions
 - a. Use alternative devices, such as pressure-sensitive beds or chair pads with alarms or other types of bed or chair alarms, whenever possible.
 - b. If restraints are necessary, the health care provider's (HCP's) prescriptions should state the type of restraint, identify specific client behaviors for which restraints are to be used, and identify a limited time frame for use.
 - c. The HCP's prescriptions for restraints should be renewed within a specific time frame according to agency policy.
 - d. Restraints are not to be prescribed PRN (as needed).
 - e. The reason for the safety device should be given to the client and the family, and their permission should be sought.
 - f. Restraints should not interfere with any treatments or affect the client's health problem.
 - g. Use a half-bow or safety knot (quick release tie) or a restraint with a quick release buckle to secure the device to the bed frame or chair, not to the side rails.
 - h. Ensure that there is enough slack on the straps to allow some movement of the body part.
 - i. Assess skin integrity and neurovascular and circulatory status every 30 minutes and remove the safety device at least every 2 hours to permit muscle exercise and to promote circulation (follow agency policies).
 - j. Continually assess and document the need for safety devices (Box 16-4).
 - k. Offer fluids if clinically indicated every 2 hours.
 - l. Offer bedpan or toileting every 2 hours.

 An HCP's prescription for use of a safety device (restraint) is needed. Alternative measures for safety devices should always be used first.

5. Alternatives to safety devices

- a. Orient the client and family to the surroundings.
- b. Explain all procedures and treatments to the client and family.
- c. Encourage family and friends to stay with the client, and use sitters for clients who need supervision.

BOX 16-4 Documentation Points with Use of a Safety Device (Restraint)

- Reason for safety device
- Method of use for safety device
- Date and time of application of safety device
- Duration of use of safety device and client's response
- Release from safety device with periodic exercise and circulatory, neurovascular, and skin assessment
- Assessment of continued need for safety device
- Evaluation of client's response

- d. Assign confused and disoriented clients to rooms near the nurses' station.
- e. Provide appropriate visual and auditory stimuli, such as a night light, clocks, calendars, television, and a radio, to the client.
- f. Place familiar items, such as family pictures, near the client's bedside.
- g. Maintain toileting routines.
- h. Eliminate bothersome treatments, such as nasogastric tube feedings, as soon as possible.
- i. Evaluate all medications that the client is receiving.
- j. Use relaxation techniques with the client.
- k. Institute exercise and ambulation schedules as the client's condition allows.
- l. Collaborate with the HCP to evaluate oxygenation status, vital signs, electrolyte/laboratory values, and other pertinent assessment findings that may provide information about the cause of the client's confusion.

K. Poisons

1. A poison is any substance that impairs health or destroys life when ingested, inhaled, or otherwise absorbed by the body.
2. Specific antidotes or treatments are available only for some types of poisons.
3. The capacity of body tissue to recover from a poison determines the reversibility of the effect.
4. Poison can impair the respiratory, circulatory, central nervous, hepatic, gastrointestinal, and renal systems of the body.
5. The toddler, the preschooler, and the young school-age child must be protected from accidental poisoning.
6. In older adults, diminished eyesight and impaired memory may result in accidental ingestion of poisonous substances or an overdose of prescribed medications.
7. A Poison Control Center phone number should be visible on the telephone in homes with small children; in all cases of suspected poisoning, the number should be called immediately.
8. Interventions
 - a. Remove any obvious materials from the mouth, eyes, or body area immediately.

- b. Identify the type and amount of substance ingested.
- c. Call the Poison Control Center before attempting an intervention.
- d. If the victim vomits or vomiting is induced, save the vomitus if requested to do so, and deliver it to the Poison Control Center.
- e. If instructed by the Poison Control Center to take the person to the emergency department, call an ambulance.
- f. Never induce vomiting following ingestion of lye, household cleaners, grease, or petroleum products.
- g. Never induce vomiting in an unconscious victim.

 **The Poison Control Center should be called first before attempting an intervention.**

II. Health Care–Associated (Nosocomial) Infections

- A. Health care–associated (nosocomial) infections also are referred to as hospital-acquired infections.
- B. These infections are acquired in a hospital or other health care facility and were not present or incubating at the time of a client's admission.
- C. *Clostridium difficile* is spread mainly by hand-to-hand contact in a health care setting. Clients taking multiple antibiotics for a prolonged period are most at risk.
- D. Common drug-resistant infections: Vancomycin-resistant enterococci, methicillin-resistant *Staphylococcus aureus*, multidrug-resistant tuberculosis, carbapenem-resistant Enterobacteriaceae (CRE)
- E. Illness and some medications such as immunosuppressants impair the normal defense mechanisms.
- F. The hospital environment provides exposure to a variety of virulent organisms that the client has not been exposed to in the past; therefore, the client has not developed resistance to these organisms.
- G. Infections can be transmitted by health care personnel who fail to practice proper hand-washing procedures or fail to change gloves between client contacts.
- H. At many health care agencies, dispensers containing an alcohol-based solution for hand sanitization are mounted at the entrance to each client's room; it is important to note that alcohol-based sanitizers are not effective against some infectious agents such as *Clostridium difficile* spores.

III. Standard Precautions**A. Description**

1. Nurses must practice standard precautions with all clients in any setting, regardless of the diagnosis or presumed infectiveness.
2. Standard precautions include hand washing and the use of gloves, masks, eye protection, and gowns, when appropriate, for client contact.

3. These precautions apply to blood, all body fluids (whether or not they contain blood), secretions and excretions, nonintact skin, and mucous membranes.

B. Interventions

1. Wash hands between client contacts; after contact with blood, body fluids, secretions or excretions, nonintact skin, or mucous membranes; after contact with equipment or contaminated articles; and immediately after removing gloves.
2. Wear gloves when touching blood, body fluids, secretions, excretions, nonintact skin, mucous membranes, or contaminated items; remove gloves and wash hands between client care contacts.
3. For routine decontamination of hands, use alcohol-based hand rubs when hands are not visibly soiled. For more information on hand hygiene from the Centers for Disease Control and Prevention (CDC), see www.cdc.gov/handhygiene/
4. Wear masks and eye protection, or face shields, if client care activities may generate splashes or sprays of blood or body fluid.
5. Wear gowns if soiling of clothing is likely from blood or body fluid; wash hands after removing a gown.
6. Steps for donning and removing personal protective equipment (PPE) (Table 16-2)
7. Clean and reprocess client care equipment properly and discard single-use items.
8. Place contaminated linens in leak-proof bags and limit handling to prevent skin and mucous membrane exposure.
9. Use needleless devices or special needle safety devices whenever possible to reduce the risk of needle sticks and sharps injuries to health care workers.
10. Discard all sharp instruments and needles in a puncture-resistant container; dispose of needles uncapped or engage the safety mechanism on the needle if available.
11. Clean spills of blood or body fluids with a solution of bleach and water (diluted 1:10) or agency-approved disinfectant.

 **Handle all blood and body fluids from all clients as if they were contaminated.**

IV. Transmission-Based Precautions

A. Transmission-based precautions include airborne, droplet, and contact precautions.

B. Airborne precautions

1. Diseases
 - a. Measles
 - b. Chickenpox (varicella)
 - c. Disseminated varicella zoster
 - d. Pulmonary or laryngeal tuberculosis

TABLE 16-2 Steps for Donning and Removing Personal Protective Equipment (PPE)

Donning of PPE	Removal of PPE*
Gown Fully cover front of body from neck to knees and upper arms to end of wrist Fasten in the back at neck and waist, wrap around the back	Gloves Grasp outside of glove with opposite hand with glove still on and peel off Hold on to removed glove in gloved hand Slide fingers of ungloved hand under clean side of remaining glove at wrist and peel off
Mask or Respirator Secure ties or elastic band at neck and middle of head Fit snug to face and below chin Fit to nose bridge Respirator fit should be checked per agency policy	Goggles/Face Shield Remove by touching clean band or inner part
Goggles/Face Shield Adjust to fit according to agency policy	Gown Unfasten at neck, then at waist Remove using a peeling motion, pulling gown from each shoulder toward the hands Allow gown to fall forward, and roll into a bundle to discard
Gloves Select appropriate size and extend to cover wrists of gown	Mask or Respirator Grasp bottom ties then top ties to remove

*Note: All equipment is considered contaminated on the outside.

2. Barrier protection

- a. Single room is maintained under negative pressure; door remains closed except upon entering and exiting.
- b. Negative airflow pressure is used in the room, with a minimum of 6 to 12 air exchanges per hour via high-efficiency particulate air (HEPA) filtration mask or according to agency protocol.
- c. Ultraviolet germicide irradiation or HEPA filter is used in the room.
- d. Health care workers wear a respiratory mask (N95 or higher level). A surgical mask is placed on the client when the client needs to leave the room; the client leaves the room only if necessary.

C. Droplet precautions

1. Diseases
 - a. Adenovirus
 - b. Diphtheria (pharyngeal)
 - c. Epiglottitis
 - d. Influenza (flu)
 - e. Meningitis
 - f. Mumps
 - g. Mycoplasmal pneumonia or meningococcal pneumonia

- h. Parvovirus B19
 - i. Pertussis
 - j. Pneumonia
 - k. Rubella
 - l. Scarlet fever
 - m. Sepsis
 - n. Streptococcal pharyngitis
2. Barrier protection
 - a. Private room or cohort client (a client whose body cultures contain the same organism)
 - b. Wear a surgical mask when within 3 feet of a client.
 - c. Place a mask on the client when the client needs to leave the room.
- D. Contact precautions
1. Diseases
 - a. Colonization or infection with a multidrug-resistant organism
 - b. Enteric infections, such as *Clostridium difficile*
 - c. Respiratory infections, such as respiratory syncytial virus
 - d. Influenza: Infection can occur by touching something with flu viruses on it and then touching the mouth or nose.
 - e. Wound infections
 - f. Skin infections, such as cutaneous diphtheria, herpes simplex, impetigo, pediculosis, scabies, staphylococci, and varicella zoster
 - g. Eye infections, such as conjunctivitis
 - h. Indirect contact transmission may occur when contaminated object or instrument, or hands, are encountered.
 2. Barrier protection
 - a. Private room or cohort client
 - b. Use gloves and a gown whenever entering the client's room.

V. Emergency Response Plan and Disasters

- A. Know the emergency response plan of the agency.
- B. Internal disasters are those that occur within the health care facility.
- C. External disasters occur in the community, and victims are brought to the health care facility for care.
- D. When the health care facility is notified of a disaster, the nurse should follow the guidelines specified in the emergency response plan of the facility.
- E. See [Chapter 7](#) for additional information on disaster planning.

! In the event of a disaster, the emergency response plan is activated immediately.

VI. Biological Warfare Agents

- A. A warfare agent is a biological or chemical substance that can cause mass destruction or fatality.
- B. Anthrax ([Fig. 16-1](#))

FIGURE 16-1 Anthrax. (From Swartz, 2010.)

1. The disease is caused by *Bacillus anthracis* and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.
2. Anthrax is transmitted by direct contact with bacteria and spores; spores are dormant encapsulated bacteria that become active when they enter a living host (no person-to-person spread) ([Box 16-5](#)).
3. The infection is carried to the lymph nodes and then spreads to the rest of the body by way of the blood and lymph; high levels of toxins lead to shock and death.
4. In the lungs, anthrax can cause buildup of fluid, tissue decay, and death (fatal if untreated).
5. A blood test is available to detect anthrax (detects and amplifies *Bacillus anthracis* DNA if present in the blood sample).
6. Anthrax is usually treated with antibiotics such as ciprofloxacin, doxycycline, or penicillin.
7. The vaccine for anthrax has limited availability.

BOX 16-5 Anthrax: Transmission and Symptoms

Skin

Spores enter the skin through cuts and abrasions and are contracted by handling contaminated animal skin products. Infection starts with an itchy bump like a mosquito bite that progresses to a small liquid-filled sac. The sac becomes a painless ulcer with an area of black, dead tissue in the middle. Toxins destroy surrounding tissue.

Gastrointestinal

Infection occurs following the ingestion of contaminated undercooked meat. Symptoms begin with nausea, loss of appetite, and vomiting. The disease progresses to severe abdominal pain, vomiting of blood, and severe diarrhea.

Inhalation

Infection is caused by the inhalation of bacterial spores, which multiply in the alveoli. The disease begins with the same symptoms as the flu, including fever, muscle aches, and fatigue. Symptoms suddenly become more severe with the development of breathing problems and shock. Toxins cause hemorrhage and destruction of lung tissue.

FIGURE 16-2 Smallpox. (Courtesy Centers for Disease Control and Prevention [CDC]: Evaluating patients for smallpox. Atlanta, 2002, CDC.)

C. Smallpox (Fig. 16-2)

1. Smallpox is transmitted in air droplets and by handling contaminated materials and is highly contagious.
2. Symptoms begin 7 to 17 days after exposure and include fever, back pain, vomiting, malaise, and headache.
3. Papules develop 2 days after symptoms develop and progress to pustular vesicles that are abundant on the face and extremities initially.
4. A vaccine is available to those at risk for exposure to smallpox.

D. Botulism

1. Botulism is a serious paralytic illness caused by a nerve toxin produced by the bacterium *Clostridium botulinum* (death can occur within 24 hours).
2. Its spores are found in the soil and can spread through the air or food (improperly canned food) or via a contaminated wound.
3. Botulism cannot be spread from person to person.
4. Symptoms include abdominal cramps, diarrhea, nausea and vomiting, double vision, blurred vision, drooping eyelids, difficulty swallowing or speaking, dry mouth, and muscle weakness.
5. Neurological symptoms begin 12 to 36 hours after ingestion of food-borne botulism and 24 to 72 hours after inhalation and can progress to paralysis of the arms, legs, trunk, or respiratory muscles (mechanical ventilation is necessary).
6. If diagnosed early, food-borne and wound botulism can be treated with an antitoxin that blocks the action of toxin circulating in the blood.
7. Other treatments include induction of vomiting, enemas, and penicillin.
8. No vaccine is available.

E. Plague

1. Plague is caused by *Yersinia pestis*, a bacteria found in rodents and fleas.
2. Plague is contracted by being bitten by a rodent or flea that is carrying the plague bacterium, by the ingestion of contaminated meat, or by handling an animal infected with the bacteria.

3. Transmission is by direct person-to-person spread.
4. Forms include bubonic (most common), pneumonic, and septicemic (most deadly).
5. Symptoms usually begin within 1 to 3 days and include fever, chest pain, lymph node swelling, and a productive cough (hemoptysis).
6. The disease rapidly progresses to dyspnea, stridor, and cyanosis; death occurs from respiratory failure, shock, and bleeding.
7. Antibiotics are effective only if administered immediately; the usual medications of choice include streptomycin or gentamicin.
8. A vaccine is available.

F. Tularemia

1. Tularemia (also called deer fly fever or rabbit fever) is an infectious disease of animals caused by the bacterium *Francisella tularensis*.
2. The disease is transmitted by ticks, deer flies, or contact with an infected animal.
3. Symptoms include fever, headache, and an ulcerated skin lesion with localized lymph node enlargement, eye infections, gastrointestinal ulcerations, or pneumonia.
4. Treatment is with antibiotics.
5. Recovery produces lifelong immunity (a vaccine is available).

G. Hemorrhagic fever

1. Hemorrhagic fever is caused by several viruses, including Marburg, Lassa, Junin, and Ebola.
2. The virus is carried by rodents and mosquitoes.
3. The disease can be transmitted directly by person-to-person spread via body fluids.
4. Symptoms include fever, headache, malaise, conjunctivitis, nausea, vomiting, hypotension, hemorrhage of tissues and organs, and organ failure.
5. No known specific treatment is available; treatment is symptomatic.

H. Ebola Virus Disease (EVD)

1. Previously known as Ebola hemorrhagic fever
2. Caused by infection with a virus of the family Filoviridae, genus Ebolavirus
3. First discovered in 1976 in the Democratic Republic of the Congo. Outbreaks have appeared in Africa.
4. The natural reservoir host of Ebolavirus remains unknown. It is believed that the virus is animal-borne and that bats are the most likely reservoir.
5. Spread of the virus is through contact with objects (such as clothes, bedding, needles, syringes/sharps, or medical equipment) that have been contaminated with the virus.
6. Symptoms similar to hemorrhagic fever may appear from 2 to 21 days after exposure.
7. Assessment: Ask the client if he or she traveled to an area with EVD such as Guinea, Liberia, or Sierra Leone within the last 21 days or if he or she has had contact with someone with EVD and had any of the following symptoms:

- a. Fever at home or a current temperature of 38 °C (100.4 °F) or greater
 - b. Severe headache
 - c. Muscle pain
 - d. Weakness
 - e. Fatigue
 - f. Diarrhea
 - g. Vomiting
 - h. Abdominal pain
 - i. Unexplained bleeding or bruising
8. Interventions
- a. If the assessment indicates possible infection with EVD, the client needs to be isolated in a private room with a private bathroom or a covered bedside commode with the door closed.
 - b. Health care workers need to wear the proper PPE and follow updated procedures designated by the Centers for Disease Control and Prevention for donning (putting on) and doffing (removing) PPE. Refer to the following Web site for updated information: <http://www.cdc.gov/vhf/ebola/healthcare-us/ppe/guidance.html>
 - c. The number of health care workers entering the room should be limited and a log of everyone who enters and leaves the room should be kept.
 - d. Only necessary tests and procedures should be performed, and aerosol-generating procedures should be avoided.
 - e. Refer to the CDC guidelines for cleaning, disinfecting, and managing waste (www.cdc.gov/vhf/ebola/healthcare-us/cleaning/hospitals.html).
 - f. The agency's infection control program should be notified, and state and local public health authorities should be notified. A list of the state and local health department numbers is available at www.cdc.gov/vhf/ebola/outbreaks/state-local-health-department-contacts.html

 Anthrax is transmitted by direct contact with bacteria and spores and can be contracted through the digestive system, abrasions in the skin, or inhalation through the lungs.

VII. Chemical Warfare Agents

- A. Sarin
 - 1. Sarin is a highly toxic nerve gas that can cause death within minutes of exposure.
 - 2. It enters the body through the eyes and skin and acts by paralyzing the respiratory muscles.
- B. Phosgene is a colorless gas normally used in chemical manufacturing that if inhaled at high concentrations for a long enough period will lead to severe respiratory distress, pulmonary edema, and death.
- C. Mustard gas is yellow to brown and has a garliclike odor that irritates the eyes and causes skin burns and blisters.

- D. Ionizing radiation
 - 1. Acute radiation exposure develops after a substantial exposure to radiation.
 - 2. Exposure can occur from external radiation or internal absorption.
 - 3. Symptoms depend on the amount of exposure to the radiation and range from nausea and vomiting, diarrhea, fever, electrolyte imbalances, and neurological and cardiovascular impairment to leukopenia, purpura, hemorrhage, and death.

VIII. Nurse's Role in Exposure to Warfare Agents

- A. Be aware that, initially, a bioterrorism attack may resemble a naturally occurring outbreak of an infectious disease.
- B. Nurses and other health care workers must be prepared to assess and determine what type of event occurred, the number of clients who may be affected, and how and when clients will be expected to arrive at the health care agency.
- C. It is essential to determine any changes in the microorganism that may increase its virulence or make it resistant to conventional antibiotics or vaccines.
- D. See Chapter 7 for additional information on disasters and emergency response planning.

CRITICAL THINKING What Should You Do?

Answer: Many facilities implement a “no restraint policy,” which requires health care workers to implement other safety strategies for clients who pose a risk for falls. These strategies include orienting the client and family to the surroundings; explaining all procedures and treatments to the client and family; encouraging family and friends to stay with the client as appropriate and using sitters for clients who need supervision; assigning confused and disoriented clients to rooms near the nurses' station; providing appropriate visual and auditory stimuli to the client, such as a night light, clocks, calendars, television, and a radio; maintaining toileting routines; eliminating bothersome treatments, such as tube feedings, as soon as possible; evaluating all medications that the client is receiving; using relaxation techniques with the client; and instituting exercise and ambulation schedules as the client's condition allows. Some agencies are instituting certain policies, such as hourly rounding, to ensure client safety. With hourly rounding, nurses and unlicensed assistive personnel are required to check the client to address the 5 Ps—problem, pain, positioning, potty, and possessions—every hour. This helps to eliminate the need to call for assistance and ensures that the client's basic needs are being met in a timely manner.

Reference: Perry, Potter, Ostendorf (2014), pp. 304, 307.

PRACTICE QUESTIONS

142. The nurse is preparing to initiate an intravenous (IV) line containing a high dose of potassium chloride and plans to use an IV infusion pump. The nurse brings the pump to the bedside, prepares to plug the pump cord into the wall, and notes that no receptacle is available in the wall socket. The nurse should take which action?
1. Initiate the IV line without the use of a pump.
 2. Contact the electrical maintenance department for assistance.
 3. Plug in the pump cord in the available plug above the room sink.
 4. Use an extension cord from the nurses' lounge for the pump plug.
143. The nurse obtains a prescription from a health care provider to restrain a client and instructs an unlicensed assistive personnel (UAP) to apply the safety device to the client. Which observation of unsafe application of the safety device would indicate that further instruction is required by the UAP?
1. Placing a safety knot in the safety device straps
 2. Safely securing the safety device straps to the side rails
 3. Applying safety device straps that do not tighten when force is applied against them
 4. Securing so that 2 fingers can slide easily between the safety device and the client's skin
- ❖ 144. The community health nurse is providing a teaching session about anthrax to members of the community and asks the participants about the methods of transmission. Which answers by the participants would indicate that teaching was effective? Select all that apply.
- 1. Bites from ticks or deer flies
 - 2. Inhalation of bacterial spores
 - 3. Through a cut or abrasion in the skin
 - 4. Direct contact with an infected individual
 - 5. Sexual contact with an infected individual
 - 6. Ingestion of contaminated undercooked meat
145. The nurse is giving a report to an unlicensed assistive personnel (UAP) who will be caring for a client who has hand restraints (safety devices). The nurse instructs the UAP to check the skin integrity of the restrained hands how frequently?
1. Every 2 hours
 2. Every 3 hours
 3. Every 4 hours
 4. Every 30 minutes
146. The nurse is reviewing a plan of care for a client with an internal radiation implant. Which intervention, if noted in the plan, indicates the need for revision of the plan?
1. Wearing gloves when emptying the client's bedpan
 2. Keeping all linens in the room until the implant is removed
 3. Wearing a lead apron when providing direct care to the client
 4. Placing the client in a semiprivate room at the end of the hallway
147. Contact precautions are initiated for a client with a health care-associated (nosocomial) infection caused by methicillin-resistant *Staphylococcus aureus*. The nurse prepares to provide colostomy care and should obtain which protective items to perform this procedure?
1. Gloves and gown
 2. Gloves and goggles
 3. Gloves, gown, and shoe protectors
 4. Gloves, gown, goggles, and a mask or face shield
148. The nurse enters a client's room and finds that the wastebasket is on fire. The nurse immediately assists the client out of the room. What is the next nursing action?
1. Call for help.
 2. Extinguish the fire.
 3. Activate the fire alarm.
 4. Confine the fire by closing the room door.
149. A mother calls a neighbor who is a nurse and tells the nurse that her 3-year-old child has just ingested liquid furniture polish. The nurse would direct the mother to take which immediate action?
1. Induce vomiting.
 2. Call an ambulance.
 3. Call the Poison Control Center.
 4. Bring the child to the emergency department.
150. The emergency department (ED) nurse receives a telephone call and is informed that a tornado has hit a local residential area and that numerous casualties have occurred. The victims will be brought to the ED. The nurse should take which initial action?
1. Prepare the triage rooms.
 2. Activate the emergency response plan.
 3. Obtain additional supplies from the central supply department.
 4. Obtain additional nursing staff to assist in treating the casualties.

151. The nurse is caring for a client with meningitis and implements which transmission-based precautions for this client?
1. Private room or cohort client
 2. Personal respiratory protection device
 3. Private room with negative airflow pressure
 4. Mask worn by staff when the client needs to leave the room

152. The nurse working in the emergency department (ED) is assessing a client who recently returned from Liberia and presented complaining of a fever at home, fatigue, muscle pain, and abdominal pain. Which action should the nurse take next?
1. Check the client's temperature.
 2. Contact the health care provider.
 3. Isolate the client in a private room.
 4. Check a complete set of vital signs.

ANSWERS

142. 2

Rationale: Electrical equipment must be maintained in good working order and should be grounded; otherwise, it presents a physical hazard. An IV line that contains a dose of potassium chloride should be administered by an infusion pump. The nurse needs to use hospital resources for assistance. A regular extension cord should not be used because it poses a risk for fire. Use of electrical appliances near a sink also presents a hazard. Test-Taking Strategy: Note the **subject**, electrical safety. Recalling safety issues will direct you to the correct option. Contacting the maintenance department is the only correct option since the other options are not considered safe practice when implementing electrical actions. In addition, since potassium chloride is in the IV solution, a pump must be used.

Review: **Electrical safety**

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), p. 314.

143. 2

Rationale: The safety device straps are secured to the bed frame and never to the side rails to avoid accidental injury in the event that the side rails are released. A half-bow or safety knot or device with a quick release buckle should be used to apply a safety device because it does not tighten when force is applied against it and it allows quick and easy removal of the safety device in case of an emergency. The safety device should be secure, and 1 or 2 fingers should slide easily between the safety device and the client's skin.

Test-Taking Strategy: Focus on the **subject**, the unsafe intervention. Also note the **strategic words**, further instruction is required. These words indicate a negative event query and the need to select the incorrect option. Read each option carefully. The words securing the safety device straps to the side rails in option 2 should direct your attention to this as an incorrect and unsafe action.

Review: **Safety device application**

❖ 144. 2, 3, 6

Rationale: Anthrax is caused by *Bacillus anthracis* and can be contracted through the digestive system or abrasions in the skin, or inhaled through the lungs. It cannot be spread from person to person, and it is not contracted via bites from ticks or deer flies.

Test-Taking Strategy: Focus on the **subject**, routes of transmission of anthrax. Knowledge regarding the methods of contracting anthrax is needed to answer this question. Remember that it is not spread by person-to-person contact or contracted via tick or deer fly bites.

Review: **Anthrax**

Level of Cognitive Ability: Evaluating

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Fundamentals of Care—Infection Control

Priority Concepts: Client Teaching; Infection

Reference: Ignatavicius, Workman (2016), p. 411.

145. 4

Rationale: The nurse should instruct the UAP to check safety devices and skin integrity every 30 minutes. The neurovascular and circulatory status of the extremity should also be checked every 30 minutes. In addition, the safety device should be removed at least every 2 hours to permit muscle exercise and to promote circulation. Agency guidelines regarding the use of safety devices should always be followed.

Test-Taking Strategy: Focus on the **subject**, checking skin integrity of a client with safety devices. In this situation, selecting the option that identifies the most frequent time frame is best.

Review: **Safety device** guidelines

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Leadership/Management—Delegating

Priority Concepts: Health Care Quality; Safety

Reference: Perry, Potter, Ostendorf (2014), p. 311.

146. 4

Rationale: A private room with a private bath is essential if a client has an internal radiation implant. This is necessary to prevent accidental exposure of other clients to radiation. The remaining options identify accurate interventions for a client with an internal radiation implant and protect the nurse from exposure.

Test-Taking Strategy: Note the **strategic words**, indicates the need for revision. These words indicate a **negative event query**

and the need to select the incorrect nursing intervention. Remember that the client with an internal radiation implant needs to be placed in a private room.

Review: **Radiation safety** principles

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Fundamentals of Care—Safety

Priority Concepts: Health Care Quality; Safety

Reference: Ignatavicius, Workman (2016), p. 376.

147. 4

Rationale: Splashes of body secretions can occur when providing colostomy care. Goggles and a mask or face shield are worn to protect the face and mucous membranes of the eyes during interventions that may produce splashes of blood, body fluids, secretions, or excretions. In addition, contact precautions require the use of gloves, and a gown should be worn if direct client contact is anticipated. Shoe protectors are not necessary.

Test-Taking Strategy: Focus on the **subject**, protective items needed to perform colostomy care. Also, note the words contact precautions. Visualize care for this client to determine the necessary items required for self-protection. This will direct you to the correct option.

Review: **Transmission-based precautions**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Infection Control

Priority Concepts: Clinical Judgment; Safety

Reference: Ignatavicius, Workman (2016), pp. 403-404, 453.

148. 3

Rationale: The order of priority in the event of a fire is to rescue the clients who are in immediate danger. The next step is to activate the fire alarm. The fire then is confined by closing all doors and, finally, the fire is extinguished.

Test-Taking Strategy: Note the **strategic word**, next. Remember the mnemonic RACE to prioritize in the event of a fire. R is rescue clients in immediate danger, A is alarm (sound the alarm), C is confine the fire by closing all doors, and E is extinguish or evacuate.

Review: **Fire safety**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 313-314.

149. 3

Rationale: If a poisoning occurs, the Poison Control Center should be contacted immediately. Vomiting should not be induced if the victim is unconscious or if the substance ingested is a strong corrosive or petroleum product. Bringing the child to the emergency department or calling an ambulance would not be the initial action because this would delay treatment. The Poison Control Center may advise the mother to bring

the child to the emergency department; if this is the case, the mother should call an ambulance.

Test-Taking Strategy: Note the **strategic word**, immediate. Calling the Poison Control Center is the first action since it will direct the mother on the next step to take based on the type of poisoning. The other options are unsafe or could cause a delay in treatment.

Review: **Poison control** measures

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Clinical Judgment; Safety

Reference: Hockenberry, Wilson (2015), pp. 545, 548.

150. 2

Rationale: In an external disaster (a disaster that occurs outside of the institution or agency), many victims may be brought to the ED for treatment. The initial nursing action must be to activate the emergency response plan. Once the emergency response plan is activated, the actions in the other options will occur.

Test-Taking Strategy: Note the **strategic word**, initial, and determine the priority action. Note that the correct option is the **umbrella option**. The emergency response plan includes all of the other options.

Review: **Disaster preparedness**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Clinical Judgment; Safety

Reference: Ignatavicius, Workman (2016), pp. 140-143.

151. 1

Rationale: Meningitis is transmitted by droplet infection. Precautions for this disease include a private room or cohort client and use of a standard precaution mask. Private negative airflow pressure rooms and personal respiratory protection devices are required for clients with airborne disease such as tuberculosis. When appropriate, a mask must be worn by the client and not the staff when the client leaves the room.

Test-Taking Strategy: Focus on the **subject**, the correct precaution needs for a client with meningitis. Recalling that meningitis is transmitted by droplets will direct you to the correct option.

Review: **Transmission-based precautions**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Infection Control

Priority Concepts: Infection; Safety

Reference: Ignatavicius, Workman (2016), pp. 403-404.

152. 3

Rationale: The nurse should suspect the potential for Ebola virus disease (EVD) because of the client's recent travel to Liberia. The nurse needs to consider the symptoms that the client is reporting, and clients who meet the exposure criteria should be

isolated in a private room before other treatment measures are taken. Exposure criteria include a fever reported at home or in the ED of 38.0 °C (100.4 °F) or headache, fatigue, weakness, muscle pain, vomiting, diarrhea, abdominal pain, or signs of bleeding. This client is reporting a fever and is showing other signs of EVD, and therefore should be isolated. After isolating the client, it would be acceptable to then collect further data and notify the health care provider and other state and local authorities of the client's signs and symptoms.

Test-Taking Strategy: Note the **strategic word**, next. This indicates that some or all of the other options may be partially or totally correct, but the nurse needs to prioritize. Eliminate options 1 and 4 first because they are **comparable**

or alike. Next note that the client recently traveled to Liberia. Recall that isolation to prevent transmission of an infection is the immediate priority in the care of a client with suspected EVD.

Review: Care of the client with **Ebola virus disease**.

CHAPTER 17

Calculation of Medication and Intravenous Prescriptions

PRIORITY CONCEPTS Clinical Judgment, Safety

CRITICAL THINKING What Should You Do?

The nurse is preparing to administer 30 milliliters (mL) of a liquid medication to an assigned client. What should the nurse do when preparing this medication?

Answer located on p. 209.

I. Medication Administration (Box 17-1)

II. Medication Measurement Systems

A. Metric system (Box 17-2)

1. The basic units of metric measures are the meter, liter, and gram.
2. Meter measures length; liter measures volume; gram measures mass.

B. Apothecary and household systems

1. The apothecary and household systems are the oldest of the medication measurement systems.
2. Apothecary measures such as grain, dram, minim, and ounce are not commonly used in the clinical setting.
3. Commonly used household measures include drop, teaspoon, tablespoon, ounce, pint, and cup.

 The NCLEX® will not present questions that require you to convert from the apothecary system of measurement to the metric system; however, this system is still important to know because, although it is not common, you may encounter it in the clinical setting.

C. Additional common medication measures

1. Milliequivalent
 - a. Milliequivalent is abbreviated mEq.
 - b. The milliequivalent is an expression of the number of grams of a medication contained in 1 mL of a solution.

- c. For example, the measure of serum potassium is given in milliequivalents.
2. Unit
 - a. Unit measures a medication in terms of its action, not its physical weight.
 - b. For example, penicillin, heparin sodium, and insulin are measured in units.

III. Conversions

A. Conversion between metric units (Box 17-3)

1. The metric system is a decimal system; therefore, conversions between the units in this system can be done by dividing or multiplying by 1000 or by moving the decimal point 3 places to the right or 3 places to the left.
2. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal point 3 places to the right.
3. In the metric system, to convert smaller to larger, divide by 1000 or move the decimal point 3 places to the left.

B. Conversion between household and metric systems

1. Household and metric measures are equivalent and not equal measures.
2. Conversion to equivalent measures between systems is necessary when a medication prescription is written in one system but the medication label is stated in another.
3. Medications are not always prescribed and prepared in the same system of measurement; therefore, conversion of units from one system to another is necessary. However, the metric system is the most commonly used system in the clinical setting.
4. Calculating equivalents between 2 systems may be done by using the method of ratio and proportion (Boxes 17-4 and 17-5).

 Conversion is the first step in the calculation of dosages.

BOX 17-1 Medication Administration

Assess the medication prescription.
 Compare the client's medication prescription with all medications that the client was previously taking (**medication reconciliation**).
 Ask the client about a history of allergies.
 Assess the client's current condition and the purpose for the medication or intravenous (IV) solution.
 Determine the client's understanding of the purpose of the prescribed medication or need for IV solution.
 Teach the client about the medication and about self-administration at home.
 Identify and address concerns (social, cultural, religious) that the client may have about taking the medication.
 Assess the need for conversion when preparing a dose of medication for administration to the client.
 Assess the 6 rights of medication administration: right medication, right dose, right client, right route, right time, and right documentation.
 Assess the vital signs, check significant laboratory results, and identify any potential interactions (food or medication interactions) before administering medication, when appropriate.
 Document the administration of the prescribed therapy and the client's response to the therapy.

BOX 17-2 Metric System

Abbreviations	Equivalents
meter: m	1 mcg $\frac{1}{4}$ 0.000001 g
liter: L	1 mg $\frac{1}{4}$ 1000 mcg or 0.001 g
milliliter: mL	1 g $\frac{1}{4}$ 1000 mg
kilogram: kg	1 kg $\frac{1}{4}$ 1000 g
gram: g	1 kg $\frac{1}{4}$ 2.2 lb
milligram: mg	1 mL $\frac{1}{4}$ 0.001 L
microgram: mcg	

BOX 17-3 Conversion Between Metric Units**Problem 1**

Convert 2 g to milligrams.

Solution

Change a larger unit to a smaller unit:

$$2 \text{ g} \frac{1}{4} 2000 \text{ mg (moving decimal point 3 places to the right)}$$

Problem 2

Convert 250 mL to liters.

Solution

Change a smaller unit to a larger unit:

$$250 \text{ mL} \frac{1}{4} 0.25 \text{ L (moving decimal point 3 places to the left)}$$

BOX 17-4 Ratio and Proportion

Ratio: The relationship between 2 numbers, separated by a colon; for example, 1:2 (1 to 2).

Proportion: The relationship between 2 ratios, separated by a double colon (::) or an equal sign ($\frac{1}{4}$).

Formula:

$$H \text{ on hand} : V \text{ vehicle} :: D \text{ desired dose} : X \text{ unknown}$$

To solve a ratio and proportion problem: The middle numbers (means) are multiplied and the end numbers (extremes) are multiplied.

Sample Problem

$$H \frac{1}{4} 1$$

$$V \frac{1}{4} 2$$

$$\text{Desired dose} \frac{1}{4} 3$$

$$X \frac{1}{4} \text{unknown}$$

$$\text{Set up the formula: } 1 : 2 :: 3 : X$$

Solve: Multiply means and extremes:

$$1X \frac{1}{4} 6$$

$$X \frac{1}{4} 6$$

BOX 17-5 Calculating Equivalents Between Two Systems

Calculating equivalents between 2 systems may be done by using the method of ratio and proportion.

Problem

The health care provider prescribes nitroglycerin $\frac{1}{150}$ grain (gr). The medication label reads 0.4 milligrams (mg) per tablet. The nurse prepares to administer how many tablets to the client? If you knew that $\frac{1}{150}$ gr was equal to 0.4 mg, you would know that you need to administer 1 tablet. Otherwise, use the ratio and proportion formula.

Ratio and Proportion Formula

$$H \text{ on hand} : V \text{ vehicle} :: D \text{ desired dose} : X \text{ unknown}$$

$$1 \text{ gr} : 60 \text{ mg} :: \frac{1}{150} \text{ gr} : X \text{ mg}$$

$$60 \hat{A} \frac{1}{150} \frac{1}{4} X$$

$$X \frac{1}{4} 0.4 \text{ mg} \text{ } \frac{1}{4} \text{ tablet}$$

IV. Medication Labels

A. A medication label always contains the **generic name** and may contain the **trade name** of the medication.

 The NCLEX now only tests you on generic names of medications. Trade names will not be available for most medications, so be sure to learn medications by their generic names for the examination. However, you will likely still encounter the trade names in the clinical setting.

B. Always check expiration dates on medication labels. 

BOX 17-6 Medication Prescriptions

Name of client
 Date and time when prescription is written
 Name of medication to be given
 Dosage of medication
 Medication route
 Time and frequency of administration
 Signature of person writing the prescription

V. Medication Prescriptions (Box 17-6)

- A. In a medication prescription, the name of the medication is written first, followed by the dosage, route, and frequency (depending on the frequency of the prescription, times of administration are usually established by the health care agency and written in an agency policy).
- B. Medication prescriptions need to be written using accepted abbreviations, acronyms, and symbols approved by The Joint Commission; also follow agency guidelines.

! If the nurse has any questions about or sees inconsistencies in the written prescription, the nurse must contact the person who wrote the prescription immediately and must verify the prescription.

VI. Oral Medications

- A. Scored tablets contain an indented mark to be used for possible breakage into partial doses; when necessary, scored tablets (those marked for division) can be divided into halves or quarters according to agency policy.
- B. Enteric-coated tablets and sustained-released capsules delay absorption until the medication reaches the small intestine; these medications should not be crushed.
- C. Capsules contain a powdered or oily medication in a gelatin cover.
- D. Orally administered liquids are supplied in solution form and contain a specific amount of medication in a given amount of solution, as stated on the label.
- E. The medicine cup
1. The medicine cup has a capacity of 30 mL or 1 ounce (oz) and is used for orally administered liquids.
 2. The medicine cup is calibrated to measure teaspoons, tablespoons, and ounces.
 3. To pour accurately, place the medication cup on a level surface at eye level and then pour the liquid while reading the measuring markings.
- F. Volumes of less than 5 mL are measured using a syringe with the needle removed.

! A calibrated syringe is used for giving medicine to children.

VII. Parenteral Medications

- A. Parenteral always means an injection route and parenteral medications are administered by intravenous (IV), intramuscular, subcutaneous, or intradermal injection (see Fig. 17-1 for angles of injection).
- B. Parenteral medications are packaged in single-use ampules, in single- and multiple-use rubber-stoppered vials, and in premeasured syringes and cartridges.
- C. The nurse should not administer more than 3 mL per intramuscular injection site (2 mL for the deltoid) or 1 mL per subcutaneous injection site; larger volumes are difficult for an injection site to absorb and, if prescribed, need to be verified. Variations for pediatric clients are discussed in the pediatric sections of this text.
- D. The standard 3-mL syringe is used to measure most injectable medications and is calibrated in tenths (0.1) of a milliliter.
- E. The syringe is filled by drawing in solution until the top ring on the plunger (i.e., the ring closest to the needle), not the middle section or the bottom ring of the plunger, is aligned with the desired calibration (Fig. 17-2).

FIGURE 17-1 Angles of injection.

FIGURE 17-2 Parts of a syringe.

FIGURE 17-3 Five-milliliter syringe.

⚠ Always question and verify excessively large or small volumes of medication.

- F. Prefilled medication cartridge
1. The medication cartridge slips into the cartridge holder, which provides a plunger for injection of the medication.
 2. The cartridge is designed to provide sufficient capacity to allow for the addition of a second medication when combined dosages are prescribed.
 3. The prefilled medication cartridge is to be used once and discarded; if the nurse is to give less than the full single dose provided, the nurse needs to discard the extra amount before giving the client the injection, in accordance with agency policies and procedures.
- G. In general, standard medication doses for adults are to be rounded to the nearest tenth (0.1 mL) of a milliliter and measured on the milliliter scale; for example, 1.28 mL is rounded to 1.3 mL (follow agency policy for rounding medication doses).
- H. When volumes larger than 3 mL are required, the nurse may use a 5-mL syringe; these syringes are calibrated in fifths (0.2 mL) (Fig. 17-3).
- I. Other syringe sizes may be available (10, 20, and 50 mL) and may be used for medication administration requiring dilution.
- J. Tuberculin syringe (Fig. 17-4)
1. The tuberculin syringe holds 1 mL and is used to measure small or critical amounts of medication, such as allergen extract, vaccine, or a child's medication.
 2. The syringe is calibrated in hundredths (0.01) of a milliliter, with each one tenth (0.1) marked on the metric scale.
- K. Insulin syringe (Fig. 17-5)
1. The standard 100-unit insulin syringe is calibrated for 100 units of insulin (100 units $\frac{1}{4}$ 1 mL);

low-dose insulin syringes ($\frac{1}{2}$ - and $\frac{3}{10}$ -mL sizes) may also be used when administering smaller insulin doses.

2. Insulin should not be measured in any other type of syringe.

⚠ If the insulin prescription states to administer regular and NPH insulin, combine both types of insulin in the same syringe. Use the mnemonic RN: Draw Regular insulin into the insulin syringe first, and then draw the NPH insulin.

- L. Safety needles contain shielding devices that are attached to the needle and slipped over the needle to reduce the incidence of needle-stick injuries.

VIII. Injectable Medications in Powder Form

- A. Some medications become unstable when stored in solution form and are therefore packaged in powder form.
- B. Powders must be dissolved with a sterile diluent before use; usually, sterile water or normal saline is used. The dissolving procedure is called reconstitution (Box 17-7).

IX. Calculating the Correct Dosage (see Box 17-8 for the standard formula)

- A. When calculating dosages of oral medications, check the calculation and question the prescription if the calculation calls for more than 3 tablets.

BOX 17-7 Reconstitution

In reconstituting a medication, locate the instructions on the label or in the vial package insert, and read and follow the directions carefully.

Instructions will state the volume of diluent to be used and the resulting volume of the reconstituted medication.

Often, the powdered medication adds volume to the solution in addition to the amount of diluent added.

The total volume of the prepared solution will exceed the volume of the diluent added.

When reconstituting a multiple-dose vial, label the medication vial with the date and time of preparation, your initials, and the date of expiration.

Indicating the strength per volume on the medication label also is important.

FIGURE 17-4 Tuberculin syringe.

FIGURE 17-5 A 100-unit insulin syringe.

BOX 17-8 Standard Formula for Calculating a Medication Dosage

$$\frac{D}{A} \hat{=} Q \frac{1}{X}$$

D (desired) is the dosage that the health care provider prescribed.

A (available) is the dosage strength as stated on the medication label.

Q (quantity) is the volume or form in which the dosage strength is available, such as tablets, capsules, or milliliters.

- B. When calculating dosages of parenteral medications, check the calculation and question the prescription if the amount to be given is too large a dose.
- C. Be sure that all measures are in the same system, and that all units are in the same size, converting when necessary; carefully consider what the reasonable amount of the medication that should be administered is.
- D. Round standard injection doses to tenths and measure in a 3-mL syringe (follow agency policy).
- E. Round small, critical amounts or children's doses to hundredths and measure in a 1-mL tuberculin syringe (follow agency policy).
- F. In addition to using the standard formula (see [Box 17-8](#)), calculations can be done using dimensional analysis, a method that uses conversion factors to move from one unit of measurement to another; the required elements of the equation include the desired answer units, conversion formula that includes the desired answer units and the units that need to be converted, and the original factors to convert including quantity and units.

 **Regardless of the source or cause of a medication error, if the nurse gives an incorrect dose, the nurse is legally responsible for the action.**

X. Percentage and Ratio Solutions
A. Percentage solutions

1. Express the number of grams (g) of the medication per 100 mL of solution.
2. For example, calcium gluconate 10% is 10 g of pure medication per 100 mL of solution.

B. Ratio solutions

1. Express the number of grams of the medication per total milliliters of solution.
2. For example, epinephrine 1:1000 is 1 g of pure medication per 1000 mL of solution.

XI. Intravenous Flow Rates ([Box 17-9](#))

- A. Monitor IV flow rate frequently even if the IV solution is being administered through an electronic infusion device (follow agency policy regarding frequency).

BOX 17-9 Formulas for Intravenous Calculations

Flow Rates

$$\frac{\text{Total volume} \hat{=} \text{Drop factor}}{\text{Time in minutes}} \frac{1}{4} \text{ Drops per minute}$$

Infusion Time

$$\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} \frac{1}{4} \text{ Infusion time}$$

Number of Milliliters per Hour

$$\frac{\text{Total volume in milliliters}}{\text{Number of hours}} \frac{1}{4} \text{ Number of milliliters per hour}$$

- B. If an IV is running behind schedule, collaborate with the health care provider to determine the client's ability to tolerate an increased flow rate, particularly for older clients and those with cardiac, pulmonary, renal, or neurological conditions.

 **The nurse should never increase the rate of (i.e., speed up) an IV infusion to catch up if the infusion is running behind schedule.**

- C. Whenever a prescribed IV rate is increased, the nurse should assess the client for increased heart rate, increased respirations, and increased lung congestion, which could indicate fluid overload.
- D. Intravenously administered fluids are prescribed most frequently based on milliliters per hour to be administered.
- E. The volume per hour prescribed is administered by setting the flow rate, which is counted in drops per minute.
- F. Most flow rate calculations involve changing milliliters per hour to drops per minute.
- G. Intravenous tubing
 1. IV tubing sets are calibrated in drops per milliliter; this calibration is needed for calculating flow rates.
 2. A standard or macrodrip set is used for routine adult IV administrations; depending on the manufacturer and type of tubing, the set will require 10, 15, or 20 drops (gtt) to equal 1 mL.
 3. A minidrip or microdrip set is used when more exact measurements are needed, such as in intensive care units and pediatric units.
 4. In a minidrip or microdrip set, 60 gtt is usually equal to 1 mL.
 5. The calibration, in drops per milliliter, is written on the IV tubing package.

XII. Calculation of Infusions Prescribed by Unit Dosage per Hour

- A. The most common medications that will be prescribed by unit dosage per hour and run by continuous infusion are heparin sodium and regular insulin.

BOX 17-10 Infusions Prescribed by Unit Dosage per Hour

Calculation of these problems can be done using a 2-step process.

1. Determine the amount of medication per 1 mL.
2. Determine the infusion rate or milliliters per hour.

Problem 1

Prescription: Continuous heparin sodium by IV at 1000 units per hour

Available: IV bag of 500 mL D₅W with 20,000 units of heparin sodium

How many milliliters per hour are required to administer the correct dose?

Solution

Step 1: Calculate the amount of medication (units) per milliliter (mL).

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \frac{1}{4} \text{ Amount of medication per milliliter}$$

$$\frac{20,000 \text{ units}}{500 \text{ mL}} = \frac{1}{4} 40 \text{ units} = 1 \text{ mL}$$

Step 2: Calculate milliliters per hour.

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \frac{1}{4} \text{ Infusion rate, or mL} = \text{hour}$$

$$\frac{1000 \text{ units}}{40 \text{ units}} = \frac{1}{4} 25 \text{ mL} = \text{hour}$$

Problem 2

Prescription: Continuous regular insulin by IV at 10 units per hour

Available: IV bag of 100 mL NS with 50 units regular insulin

How many milliliters per hour are required to administer the correct dose?

Solution

Step 1: Calculate the amount of medication (units) per milliliter.

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} = \frac{1}{4} \text{ Amount of medication per milliliter}$$

$$\frac{50 \text{ units}}{100 \text{ mL}} = \frac{1}{4} 0.5 \text{ units} = 1 \text{ mL}$$

Step 2: Calculate milliliters per hour.

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} = \frac{1}{4} \text{ Infusion rate, or mL} = \text{hour}$$

$$\frac{10 \text{ units}}{0.5 \text{ units} = \text{mL}} = \frac{1}{4} 20 \text{ mL} = \text{hour}$$

B. Calculation of these infusions can be done using a 2-step process (Box 17-10).

1. Determine the amount of medication per 1 mL.
2. Determine the infusion rate or milliliters per hour.

CRITICAL THINKING What Should You Do?

Answer: When preparing to administer a liquid medication, the nurse should use a medicine cup, pouring the liquid into it after placing it on a flat surface at eye level with the thumbnail at the medicine cup line indicating the desired amount. Liquids should not be mixed with tablets or with other liquids in the same container. The nurse should be sure not to return poured medication to its container and should properly discard poured medication if not used. The nurse should pour liquids from the side opposite the bottle's label to avoid spilling medicine on the label. Medications that irritate the gastric mucosa, such as potassium products, should be diluted or taken with meals. Ice chips should be offered before administering unpleasant-tasting medications in order to numb the client's taste buds.

Reference: Perry, Potter, Ostendorf (2014), pp. 486, 496-498.

PRACTICE QUESTIONS

- ❖ 153. A health care provider's prescription reads 1000 mL of normal saline (NS) to infuse over 12 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse prepares to set the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
- ❖ 154. A health care provider's prescription reads to administer an intravenous (IV) dose of 400,000 units of penicillin G benzathine. The label on the 10-mL ampule sent from the pharmacy reads penicillin G benzathine, 300,000 units/mL. The nurse prepares how much medication to administer the correct dose? Fill in the blank. Record your answer using 1 decimal place.
Answer: _____ mL
- ❖ 155. A health care provider's prescription reads potassium chloride 30 mEq to be added to 1000 mL normal saline (NS) and to be administered over a 10-hour period. The label on the medication bottle reads 40 mEq/20 mL. The nurse prepares

how many milliliters of potassium chloride to administer the correct dose of medication? Fill in the blank.

Answer: _____ mL

- ❖ 156. A health care provider's prescription reads clindamycin phosphate 0.3 g in 50 mL normal saline (NS) to be administered intravenously over 30 minutes. The medication label reads clindamycin phosphate 900 mg in 6 mL. The nurse prepares how many milliliters of the medication to administer the correct dose? Fill in the blank.
Answer: _____ mL
- ❖ 157. A health care provider's prescription reads phenytoin 0.2 g orally twice daily. The medication label states that each capsule is 100 mg. The nurse prepares how many capsule(s) to administer 1 dose? Fill in the blank.
Answer: _____ capsule(s)
- ❖ 158. A health care provider prescribes 1000 mL of normal saline 0.9% to infuse over 8 hours. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
- ❖ 159. A health care provider prescribes heparin sodium, 1300 units/hour by continuous intravenous (IV) infusion. The pharmacy prepares the medication and delivers an IV bag labeled heparin sodium 20,000 units/250 mL D₅W. An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters per hour to deliver 1300 units/hour? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ mL per hour
- ❖ 160. A health care provider prescribes 3000 mL of D₅W to be administered over a 24-hour period. The nurse determines that how many milliliters per hour will be administered to the client? Fill in the blank.
Answer: _____ mL per hour
- ❖ 161. Gentamicin sulfate, 80 mg in 100 mL normal saline (NS), is to be administered over 30 minutes. The drop factor is 10 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
- ❖ 162. A health care provider's prescription reads levothyroxine, 150 mcg orally daily. The medication label reads levothyroxine, 0.1 mg/tablet. The nurse administers how many tablet(s) to the client? Fill in the blank.
Answer: _____ tablet(s)
- ❖ 163. Cefuroxime sodium, 1 g in 50 mL normal saline (NS), is to be administered over 30 minutes. The drop factor is 15 drops (gtt)/1 mL. The nurse sets the flow rate at how many drops per minute? Fill in the blank.
Answer: _____ drops per minute
- ❖ 164. A health care provider prescribes 1000 mL D₅W to infuse at a rate of 125 mL/hour. The nurse determines that it will take how many hours for 1 L to infuse? Fill in the blank.
Answer: _____ hour(s)
- ❖ 165. A health care provider prescribes 1 unit of packed red blood cells to infuse over 4 hours. The unit of blood contains 250 mL. The drop factor is 10 drops (gtt)/1 mL. The nurse prepares to set the flow rate at how many drops per minute? Fill in the blank. Record your answer to the nearest whole number.
Answer: _____ drops per minute
- ❖ 166. A health care provider's prescription reads morphine sulfate, 8 mg stat. The medication ampule reads morphine sulfate, 10 mg/mL. The nurse prepares how many milliliters to administer the correct dose? Fill in the blank.
Answer: _____ mL
- ❖ 167. A health care provider prescribes regular insulin, 8 units/hour by continuous intravenous (IV) infusion. The pharmacy prepares the medication and then delivers an IV bag labeled 100 units of regular insulin in 100 mL normal saline (NS). An infusion pump must be used to administer the medication. The nurse sets the infusion pump at how many milliliters per hour to deliver 8 units/hour? Fill in the blank.
Answer: _____ mL/hour

ANSWERS: ALTERNATE ITEM FORMAT (FILL-IN-THE-BLANK)

❖ 153. 21

Rationale: Use the intravenous (IV) flow rate formula.
Formula:

$$\frac{\text{Total Volume} \hat{\wedge} \text{Drop factor}}{\text{Time in minutes}} \frac{1}{4} \text{ Drops per minute}$$

$$\frac{1000 \text{ mL} \hat{\wedge} 15 \text{ gtt}}{720 \text{ minutes}} \frac{1}{4} \frac{15,000}{720} \frac{1}{4} 20:8, \text{ or } 21 \text{ gtt}=\text{min}$$

Test-Taking Strategy: Focus on the **subject**, IV flow rates. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number.

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 154. 1.3

Rationale: Use the medication dose formula.

Formula:

$$\frac{\text{Desired} \hat{\wedge} \text{mL}}{\text{Available}} \frac{1}{4} \text{ Milliliters per dose}$$

$$\frac{400,000 \text{ units} \hat{\wedge} 1 \text{ mL}}{300,000 \text{ units}} \frac{1}{4} \text{ Milliliters per dose}$$

$$\frac{400,000}{300,000} \frac{1}{4} 1:33 \frac{1}{4} 1:3 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to record your answer using 1 decimal place.

Review: **Medication calculations**

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 486-487.

❖ 155. 15

Rationale: In most facilities, potassium chloride is premixed in the intravenous solution and the nurse will need to verify the correct dose before administration. In some cases the nurse will need to add the potassium chloride and will use the medication calculation formula to determine the mL to be added.

Formula:

$$\frac{\text{Desired} \hat{\wedge} \text{mL}}{\text{Available}} \frac{1}{4} \text{ Milliliters per dose}$$

$$\frac{30 \text{ mEq} \hat{\wedge} 20 \text{ mL}}{40 \text{ mEq}} \frac{1}{4} 15 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct medication dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Review: **Medication calculations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 486-487.

❖ 156. 2

Rationale: You must convert 0.3 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal 3 places to the right. Therefore, 0.3 g $\frac{1}{4}$ 300 mg. Following conversion from grams to milligrams, use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired} \hat{\wedge} \text{mL}}{\text{Available}} \frac{1}{4} \text{ Milliliters per dose}$$

$$\frac{300 \text{ mg} \hat{\wedge} 6 \text{ mL}}{900 \text{ mg}} \frac{1}{4} \frac{1800}{900} \frac{1}{4} 2 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. In this medication calculation problem, first you must convert grams to milligrams. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Review: **Medication calculations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 486-487.

❖ 157. 2

Rationale: You must convert 0.2 g to milligrams. In the metric system, to convert larger to smaller, multiply by 1000 or move the decimal point 3 places to the right. Therefore, 0.2 g equals 200 mg. After conversion from grams to milligrams, use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired} \hat{\wedge} \text{Capsule} \hat{\wedge} \text{mL}}{\text{Available}} \frac{1}{4} \text{ Capsule} \hat{\wedge} \text{mL per dose}$$

$$\frac{200 \text{ mg} \hat{\wedge} 1 \text{ Capsule}}{100 \text{ mg}} \frac{1}{4} 2 \text{ Capsules}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. In this medication calculation problem, first you must convert grams to milligrams. Once you have done the conversion and reread the medication calculation problem, you will know that 2 capsules is the correct answer. Recheck

your work using a calculator and make sure that the answer makes sense.

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 159. 16

Rationale: Calculation of this problem can be done using a 2-step process. First, you need to determine the amount of heparin sodium in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

Step 1:

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} \frac{1}{4} \text{ Amount of medication per millimeter}$$

$$\frac{20,000 \text{ units}}{250 \text{ mL}} \frac{1}{4} 80 \text{ units}=\text{mL}$$

Step 2:

$$\frac{\text{Dose per hour desired}}{\text{Concentration per millileter}} \frac{1}{4} \text{ Infusion rate, or mL}=\text{hr}$$

$$\frac{1300 \text{ units}}{80 \text{ units}=\text{mL}} \frac{1}{4} 16:25, \text{ or } 16 \text{ mL}=\text{hr}$$

Test-Taking Strategy: Focus on the **subject**, an IV flow rate. Read the question carefully, noting that 2 steps can be used to solve this medication problem. Follow the formula, verify your answer using a calculator, and make sure that the answer makes sense. Remember to round the answer to the nearest whole number.

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 160. 125

Rationale: Use the intravenous (IV) formula to determine milliliters per hour.

Formula:

$$\frac{\text{Total volume in milliliters}}{\text{Number of hours}} \frac{1}{4} \text{ Milliliters per hour}$$

$$\frac{3000 \text{ mL}}{24 \text{ hours}} \frac{1}{4} 125 \text{ mL}=\text{hr}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation. Read the question carefully, noting that the question is asking about milliliters per hour to be administered to the client. Use the formula for calculating milliliters per hour. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 161. 33

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \hat{\wedge} \text{Drop factor}}{\text{Time in minutes}} \frac{1}{4} \text{ Drops per minute}$$

$$\frac{100 \text{ mL} \hat{\wedge} 10 \text{ gtt}}{30 \text{ minutes}} \frac{1}{4} \frac{1000}{30} \frac{1}{4} 33:3, \text{ or } 33 \text{ gtt}=\text{min}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number.

Review: **Intravenous infusion calculations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 162. 1.5

Rationale: You must convert 150 mcg to milligrams. In the metric system, to convert smaller to larger, divide by 1000 or

move the decimal 3 places to the left. Therefore, 150 mcg equals 0.15 mg. Next, use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired}}{\text{Available}} \hat{=} \text{Tablet} \frac{1}{4} \text{ Tablets per dose}$$

$$\frac{0.15 \text{ mg}}{0.1 \text{ mg}} \hat{=} 1 \text{ tablet} \frac{1}{4} 1.5 \text{ tablets}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. In this medication calculation problem, first you must convert micrograms to milligrams. Next, follow the formula for the calculation of the correct dose, verify your answer using a calculator, and make sure that the answer makes sense.

Review: **Medication calculations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 486-487.

❖ 163. 25

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \hat{=} \text{Drop factor}}{\text{Time in minutes}} \frac{1}{4} \text{ Drops per minute}$$

$$\frac{50 \text{ mL} \hat{=} 15 \text{ gtt}}{30 \text{ minutes}} \frac{1}{4} \frac{750}{30} \frac{1}{4} 25 \text{ gtt}=\text{min}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Review: **Intravenous infusion calculations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 164. 8

Rationale: You must determine that 1 L equals 1000 mL. Next, use the formula for determining infusion time in hours.

Formula:

$$\frac{\text{Total volume to infuse}}{\text{Milliliters per hour being infused}} \frac{1}{4} \text{ Infusion time}$$

$$\frac{1000 \text{ mL}}{125 \text{ mL}} \frac{1}{4} 8 \text{ hours}$$

Test-Taking Strategy: Focus on the **subject**, an intravenous infusion calculation. Read the question carefully, noting that the question is asking about infusion time in hours. First, convert 1 L to milliliters. Next, use the formula for determining

infusion time in hours. Verify your answer using a calculator and make sure that the answer makes sense.

Review: **Intravenous infusion calculations**

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

References: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 165. 10

Rationale: Use the intravenous (IV) flow rate formula.

Formula:

$$\frac{\text{Total volume} \hat{=} \text{Drop factor}}{\text{Time in minute}} \frac{1}{4} \text{ Drops per minute}$$

$$\frac{250 \text{ mL} \hat{=} 10 \text{ gtt}}{240 \text{ minutes}} \frac{1}{4} \frac{2500}{240} \frac{1}{4} 10:4, \text{ or } 10 \text{ gtt}=\text{min}$$

Test-Taking Strategy: Focus on the **subject**, an IV infusion calculation. Use the formula for calculating IV flow rates when answering the question. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. Remember to round the answer to the nearest whole number.

Review: **Intravenous infusion calculations**

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 710-711.

❖ 166. 0.8

Rationale: Use the formula to calculate the correct dose.

Formula:

$$\frac{\text{Desired} \hat{=} \text{mL}}{\text{Available}} \frac{1}{4} \text{ Milliliters per hour}$$

$$\frac{8 \text{ mg} \hat{=} 1 \text{ mL}}{10 \text{ mg}} \frac{1}{4} 0.8 \text{ mL}$$

Test-Taking Strategy: Focus on the **subject**, a dosage calculation. Follow the formula for the calculation of the correct dose. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense.

Review: **Medication calculations**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Medications/IV Calculations

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 486-487.

❖ 167. 8

Rationale: Calculation of this problem can be done using a 2-step process. First, you need to determine the amount of

regular insulin in 1 mL. The next step is to determine the infusion rate, or milliliters per hour.

Formula:

Step 1:

$$\frac{\text{Known amount of medication in solution}}{\text{Total volume of diluent}} \\ \frac{1}{4} \text{ Amount of medication per milliliter}$$

$$\frac{100 \text{ units}}{100 \text{ mL}} \frac{1}{4} 1 \text{ unit}=\text{mL}$$

Step 2:

$$\frac{\text{Dose per hour desired}}{\text{Concentration per milliliter}} \\ \frac{1}{4} \text{ Infusion rate, or milliliters per hour}$$

$$\frac{8 \text{ units}}{1 \text{ unit}=\text{mL}} \frac{1}{4} 8 \text{ mL}=\text{hour}$$

Test-Taking Strategy: Focus on the **subject**, an IV flow rate. Read the question carefully, noting that 2 steps can be used to solve this medication problem. Once you have performed the calculation, verify your answer using a calculator and make sure that the answer makes sense. These steps can be used for similar medication problems related to the administration of heparin sodium or regular insulin by IV infusion.

Perioperative Nursing Care

PRIORITY CONCEPT Infection; Safety

CRITICAL THINKING What Should You Do?

The nurse is assisting the surgeon in obtaining informed consent from a client for a scheduled surgical procedure. The client signs the consent and after the surgeon leaves the nursing unit the client informs the nurse that he is unclear about certain aspects of the surgical procedure. What should the nurse do?

Answer located on p. 225.

I. Preoperative Care

! A client may return home shortly after having a surgical procedure because many surgical procedures are done through ambulatory care or 1-day stay surgical units. Perioperative care procedures apply even when the client returns home on the same day of the surgical procedure.

A. Obtaining informed consent

1. The surgeon is responsible for explaining the surgical procedure to the client and answering the client's questions. Often, the nurse is responsible for obtaining the client's signature on the consent form for surgery, which indicates the client's agreement to the procedure based on the surgeon's explanation.
2. The nurse may witness the client's signing of the consent form, but the nurse must be sure that the client has understood the surgeon's explanation of the surgery.
3. The nurse needs to document the witnessing of the signing of the consent form after the client acknowledges understanding the procedure.
4. Minors (clients younger than 18 years) may need a parent or legal guardian to sign the consent form.
5. Older clients may need a legal guardian to sign the consent form.

6. Psychiatric clients have a right to refuse treatment until a court has legally determined that they are unable to make decisions for themselves.
7. No sedation should be administered to the client before the client signs the consent form.
8. Obtaining telephone consent from a legal guardian or power of attorney for health care is an acceptable practice if clients are unable to give consent themselves. The nurse must engage another nurse as a witness to the consent given over the telephone.

B. Nutrition

1. Review the surgeon's prescriptions regarding the NPO (nothing by mouth) status before surgery.
2. Withhold solid foods and liquids as prescribed to avoid aspiration, usually for 6 to 8 hours before general anesthesia and for approximately 3 hours before surgery with local anesthesia (as prescribed).
3. Insert an intravenous (IV) line and administer IV fluids, if prescribed; per agency policy, the IV catheter size should be large enough to administer blood products if they are required.

C. Elimination

1. If the client is to have intestinal or abdominal surgery, per surgeon's preference an enema, laxative, or both may be prescribed for the day or night before surgery.
2. The client should void immediately before surgery.
3. Insert an indwelling urinary catheter, if prescribed; urinary catheter collection bags should be emptied immediately before surgery, and the nurse should document the amount and characteristics of the urine.

D. Surgical site

1. Clean the surgical site with a mild antiseptic or antibacterial soap on the night before surgery, as prescribed.
2. Shave the operative site, as prescribed; shaving may be done in the operative area.

 **Hair on the head or face (including the eyebrows) should be shaved only if prescribed.**

E. Preoperative client teaching

1. Inform the client about what to expect postoperatively.
2. Inform the client to notify the nurse if the client experiences any pain postoperatively and that pain medication will be prescribed and given as the client requests. The client should be informed that some degree of pain should be expected and is normal.
3. Inform the client that requesting an opioid after surgery will not make the client a drug addict.
4. Demonstrate the use of a patient-controlled analgesia (PCA) pump if prescribed.
5. Instruct the client how to use noninvasive pain-relief techniques such as relaxation, distraction techniques, and guided imagery before the pain occurs and as soon as the pain is noticed.
6. The nurse should instruct the client not to smoke (for at least 24 hours before surgery); discuss smoking cessation treatments and programs.
7. Instruct the client in deep-breathing and coughing techniques, use of incentive spirometry, and the importance of performing the techniques postoperatively to prevent the development of pneumonia and atelectasis (Box 18-1).
8. Instruct the client in leg and foot exercises to prevent venous stasis of blood and to facilitate venous blood return (Fig. 18-1; see Box 18-1).
9. Instruct the client in how to splint an incision, turn, and reposition (Fig. 18-2; see Box 18-1).
10. Inform the client of any invasive devices that may be needed after surgery, such as a nasogastric tube, drain, urinary catheter, epidural catheter, or IV or subclavian lines.
11. Instruct the client not to pull on any of the invasive devices; they will be removed as soon as possible.

F. Psychosocial preparation

1. Be alert to the client's level of anxiety.
2. Answer any questions or concerns that the client may have regarding surgery.
3. Allow time for privacy for the client to prepare psychologically for surgery.
4. Provide support and assistance as needed.
5. Take cultural aspects into consideration when providing care (Box 18-2).

G. Preoperative checklist

1. Ensure that the client is wearing an identification bracelet.
2. Assess for allergies, including an allergy to latex (see Chapter 66 for information on latex allergy).
3. Review the preoperative checklist to be sure that each item is addressed before the client is transported to surgery.

BOX 18-1 Client Teaching

Deep-Breathing and Coughing Exercises

Instruct the client that a sitting position gives the best lung expansion for coughing and deep-breathing exercises. Instruct the client to breathe deeply 3 times, inhaling through the nostrils and exhaling slowly through pursed lips. Instruct the client that the third breath should be held for 3 seconds; then the client should cough deeply 3 times. The client should perform this exercise every 1 to 2 hours.

Incentive Spirometry

Instruct the client to assume a sitting or upright position. Instruct the client to place the mouth tightly around the mouthpiece. Instruct the client to inhale slowly to raise and maintain the flow rate indicator, usually between the 600 and 900 marks on the device. Instruct the client to hold the breath for 5 seconds and then to exhale through pursed lips. Instruct the client to repeat this process 10 times every hour.

Leg and Foot Exercises

Gastrocnemius (calf) pumping: Instruct the client to move both ankles by pointing the toes up and then down.
Quadriceps (thigh) setting: Instruct the client to press the back of the knees against the bed and then to relax the knees; this contracts and relaxes the thigh and calf muscles to prevent thrombus formation.
Foot circles: Instruct the client to rotate each foot in a circle.
Hip and knee movements: Instruct the client to flex the knee and thigh and to straighten the leg, holding the position for 5 seconds before lowering (not performed if the client is having abdominal surgery or if the client has a back problem).

Splinting the Incision

If the surgical incision is abdominal or thoracic, instruct the client to place a pillow, or 1 hand with the other hand on top, over the incisional area. During deep breathing and coughing, the client presses gently against the incisional area to splint or support it.

4. Follow agency policies regarding preoperative procedures, including informed consents, preoperative checklists, prescribed laboratory or radiological tests, and any other preoperative procedure.
5. Ensure that informed consent forms have been signed for the operative procedure, any blood transfusions, disposal of a limb, or surgical sterilization procedures.
6. Ensure that a history and physical examination have been completed and documented in the client's record (Box 18-3).
7. Ensure that consultation requests have been completed and documented in the client's record.

FIGURE 18-1 Postoperative leg exercises.

FIGURE 18-2 Techniques for splinting a wound when coughing.

BOX 18-2 Cultural Aspects of Perioperative Nursing Care

Cultural assessment includes questions related to:

- Primary language spoken
- Feelings related to surgery and pain
- Pain management
- Expectations
- Support systems
- Feelings toward self
- Cultural practices and beliefs

Allow a family member to be present if appropriate.

Secure the help of a professional interpreter to communicate with non-English-speaking clients.

Use pictures or phrase cards to communicate and assess the non-English-speaking client's perception of pain or other feelings.

Provide preoperative and postoperative educational materials in the appropriate language.

Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby.

BOX 18-3 Medical Conditions That Increase Risk During Surgery

- Bleeding disorders such as thrombocytopenia or hemophilia
- Diabetes mellitus
- Chronic pain
- Heart disease, such as a recent myocardial infarction, dysrhythmia, heart failure, or peripheral vascular disease
- Obstructive sleep apnea
- Upper respiratory infection
- Liver disease
- Fever
- Chronic respiratory disease, such as emphysema, bronchitis, or asthma
- Immunological disorders, such as leukemia, infection with human immunodeficiency virus, acquired immunodeficiency syndrome, bone marrow depression, or use of chemotherapy or immunosuppressive agents
- Abuse of street drugs

Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby.

8. Ensure that prescribed laboratory results are documented in the client's record.
9. Ensure that electrocardiogram and chest radiography reports are documented in the client's record.
10. Ensure that a blood type, screen, and crossmatch are performed and documented in the client's record within the established time frame per agency policy.
11. Remove jewelry, makeup, dentures, hairpins, nail polish (depending on agency procedures), glasses, and prostheses.

12. Document that valuables have been given to the client's family members or locked in the hospital safe.
 13. Document the last time that the client ate or drank.
 14. Document that the client voided before surgery.
 15. Document that the prescribed preoperative medications were given (Box 18-4).
 16. Monitor and document the client's vital signs.
- H. Preoperative medications
1. Prepare to administer preoperative medications as prescribed before surgery.
 2. Instruct the client about the desired effects of the preoperative medication.
-  After administering the preoperative medications, keep the client in bed with the side rails up (per agency policy). Place the call bell next to the client; instruct the client not to get out of bed and to call for assistance if needed.
- I. Arrival in the operating room
1. Guidelines to prevent wrong site and wrong procedure surgery
 - a. The surgeon meets with the client in the preoperative area and uses indelible ink to mark the operative site.
 - b. In the operating room, the nurse and surgeon ensure and reconfirm that the operative site has been appropriately marked.
 - c. Just before starting the surgical procedure, a time-out is conducted with all members of the operative team present to identify the correct client and appropriate surgical site again.
 2. When the client arrives in the operating room, the operating room nurse will verify the identification bracelet with the client's verbal response and will review the client's chart.
 3. The client's record will be checked for completeness and reviewed for informed consent forms, history and physical examination, and allergic reaction information.
 4. The surgeon's prescriptions will be verified and implemented.
 5. The IV line may be initiated at this time (or in the preoperative area), if prescribed.
 6. The anesthesia team will administer the prescribed anesthesia.
-  Verification of the client and the surgical operative site is critical.

BOX 18-4 Substances That Can Affect the Client in Surgery

Antibiotics

Antibiotics potentiate the action of anesthetic agents.

Anticholinergics

Medications with anticholinergic effects increase the potential for confusion, tachycardia, and intestinal hypomotility and hypomotility.

Anticoagulants, antiplatelets, and thrombolytics

These medications alter normal clotting factors and increase the risk of hemorrhaging.

Acetylsalicylic acid (Aspirin), clopidogrel, and nonsteroidal anti-inflammatory drugs are commonly used medications that can alter platelet aggregation.

These medications should be discontinued at least 48 hours before surgery or as specified by the surgeon; clopidogrel usually has to be discontinued 5 days before surgery.

Anticonvulsants

Long-term use of certain anticonvulsants can alter the metabolism of anesthetic agents.

Antidepressants

Antidepressants may lower the blood pressure during anesthesia.

Antidysrhythmics

Antidysrhythmic medications reduce cardiac contractility and impair cardiac conduction during anesthesia.

Antihypertensives

Antihypertensive medications can interact with anesthetic agents and cause bradycardia, hypotension, and impaired circulation.

Corticosteroids

Corticosteroids cause adrenal atrophy and reduce the ability of the body to withstand stress.

Before and during surgery, dosages may be increased temporarily.

Diuretics

Diuretics potentiate electrolyte imbalances after surgery.

Herbal Substances

Herbal substances can interact with anesthesia and cause a variety of adverse effects. These substances may need to be stopped at a specific time before surgery. During the preoperative period, the client needs to be asked if he or she is taking an herbal substance.

Insulin

The need for insulin after surgery in a diabetic may be reduced because the client's nutritional intake is decreased, or the need for insulin may be increased because of the stress response and intravenous administration of glucose solutions.

II. Postoperative Care

A. Description

1. Postoperative care is the management of a client after surgery and includes care given during the immediate postoperative period as well as during the days following surgery.
2. The goal of postoperative care is to prevent complications, to promote healing of the surgical incision, and to return the client to a healthy state.

B. Respiratory system

! Assess breath sounds; stridor, wheezing, or a crowing sound can indicate partial obstruction, bronchospasm, or laryngospasm, while crackles or rhonchi may indicate pulmonary edema.

1. Monitor vital signs.
2. Monitor airway patency and ensure adequate ventilation (prolonged mechanical ventilation during anesthesia may affect postoperative lung function).
3. Remember that extubated clients who are lethargic may not be able to maintain an airway.
4. Monitor for secretions; if the client is unable to clear the airway by coughing, suction the secretions from the client's airway.
5. Observe chest movement for symmetry and the use of accessory muscles.
6. Monitor oxygen administration if prescribed.
7. Monitor pulse oximetry and end title carbon dioxide (CO₂) as prescribed.
8. Encourage deep-breathing and coughing exercises as soon as possible after surgery.
9. Note the rate, depth, and quality of respirations; the respiratory rate should be greater than 10 and less than 30 breaths/minute.
10. Monitor for signs of respiratory distress, atelectasis, or other respiratory complications.

C. Cardiovascular system

1. Monitor circulatory status, such as skin color, peripheral pulses, and capillary refill, and for the absence of edema, numbness, and tingling.
2. Monitor for bleeding.
3. Assess the pulse for rate and rhythm (a bounding pulse may indicate hypertension, fluid overload, or client anxiety).
4. Monitor for signs of hypertension and hypotension.
5. Monitor for cardiac dysrhythmias.
6. Monitor for signs of thrombophlebitis, particularly in clients who were in the lithotomy position during surgery.
7. Encourage the use of antiembolism stockings or sequential compression devices (Fig. 18-3), if prescribed, to promote venous return, strengthen muscle tone, and prevent pooling of blood in the extremities.

FIGURE 18-3 Sequential compression device.

D. Musculoskeletal system

1. Assess the client for movement of the extremities.
2. Review the surgeon's prescriptions regarding client positioning or restrictions.
3. Encourage ambulation if prescribed; before ambulation, instruct the client to sit at the edge of the bed with his or her feet supported to assume balance.
4. Unless contraindicated, place the client in a low Fowler's position after surgery to increase the size of the thorax for lung expansion.
5. Avoid positioning the postoperative client in a supine position until pharyngeal reflexes have returned; if the client is comatose or semicomatose, position on the side (in addition, an oral airway may be needed).
6. If the client is unable to get out of bed, turn the client every 1 to 2 hours.

E. Neurological system

1. Assess level of consciousness.
2. Make frequent periodic attempts to awaken the client until the client awakens.
3. Orient the client to the environment.
4. Speak in a soft tone; filter out extraneous noises in the environment.
5. Maintain the client's body temperature and prevent heat loss by providing the client with warm blankets and raising the room temperature as necessary.

F. Temperature control

1. Monitor temperature.
2. Monitor for signs of hypothermia that may result from anesthesia, a cool operating room, or exposure of the skin and internal organs during surgery.
3. Apply warm blankets, continue oxygen, and administer medication as prescribed if the client experiences postoperative shivering.

G. Integumentary system

1. Assess the surgical site, drains, and wound dressings (serous drainage may occur from an incision, but notify the surgeon if excessive bleeding occurs from the site).
2. Assess the skin for redness, abrasions, or breakdown that may have resulted from surgical positioning.

3. Monitor body temperature and wound for signs of infection.
4. Maintain a dry, intact dressing.
5. Change dressings as prescribed, noting the amount of bleeding or drainage, odor, and intactness of sutures or staples; commonly used dressings include 4 × 4 inch gauze, nonadherent pads, abdominal pads, gauze rolls, and split gauze that are commonly referred to as drain sponges.
6. Wound drains should be patent; prepare to assist with the removal of drains (as prescribed by the surgeon) when the drainage amount becomes insignificant.
7. An abdominal binder may be prescribed for obese and debilitated individuals to prevent dehiscence of the incision.

H. Fluid and electrolyte balance

1. Monitor IV fluid administration as prescribed.
2. Record intake and output.
3. Monitor for signs of fluid or electrolyte imbalances.

I. Gastrointestinal system

1. Monitor intake and output and for nausea and vomiting.
2. Maintain patency of the nasogastric tube if present and monitor placement and drainage per agency procedure.
3. Monitor for abdominal distention.
4. Monitor for passage of flatus and return of bowel sounds.
5. Administer frequent oral care, at least every 2 hours.
6. Maintain the NPO status until the gag reflex and peristalsis return.
7. When oral fluids are permitted, start with ice chips and water.
8. Ensure that the client advances to clear liquids and then to a regular diet, as prescribed and as the client can tolerate.

 **To prevent aspiration, turn the client to a side-lying position if vomiting occurs; have suctioning equipment available and ready to use.**

J. Renal system

1. Assess the bladder for distention.
2. Monitor urine output (urinary output should be at least 30 mL/hour).
3. If the client does not have a urinary catheter, the client is expected to void within 6 to 8 hours postoperatively depending on the type of anesthesia administered; ensure that the amount is at least 200 mL.

K. Pain management

1. Assess the type of anesthetic used and preoperative medication that the client received, and note whether the client received any pain medications in the postanesthesia period.

2. Assess for pain and inquire about the type and location of pain; ask the client to rate the degree of pain on a scale of 1 to 10, with 10 being the most severe.
3. If the client is unable to rate the pain using a numerical pain scale, use a descriptor scale that lists words that describe different levels of pain intensity, such as no pain, mild pain, moderate pain, and severe pain, or other available pain rating scales.
4. Monitor for objective data related to pain, such as facial expressions, body gestures, increased pulse rate, increased blood pressure, and increased respirations.
5. Inquire about the effectiveness of the last pain medication.
6. Administer pain medication as prescribed.
7. Ensure that the client with a PCA pump understands how to use it.
8. If an opioid has been prescribed, after administration assess the client every 30 minutes for respiratory rate and pain relief.
9. Use noninvasive measures to relieve postoperative pain, including provision of distraction, relaxation techniques, guided imagery, comfort measures, positioning, backrubs, and a quiet and restful environment.
10. Document effectiveness of the pain medication and noninvasive pain-relief measures.

 **Consider cultural practices and beliefs when planning pain management.**

III. Pneumonia and Atelectasis

A. Description (Box 18-5 and Fig. 18-4)

1. Pneumonia: An inflammation of the alveoli caused by an infectious process that may develop 3 to 5 days postoperatively as a result of infection, aspiration, or immobility
2. Atelectasis: A collapsed or airless state of the lung that may be the result of airway obstruction

BOX 18-5 Postoperative Complications

- Pneumonia and atelectasis
- Hypoxemia
- Pulmonary embolism
- Hemorrhage
- Shock
- Thrombophlebitis
- Urinary retention
- Constipation
- Paralytic ileus
- Wound infection
- Wound dehiscence
- Wound evisceration

FIGURE 18-4 Postoperative atelectasis. A, Normal bronchiole and alveoli. B, Mucous plug in bronchiole. C, Collapse of alveoli caused by atelectasis following absorption of air.

caused by accumulated secretions or failure of the client to deep-breathe or ambulate after surgery; a postoperative complication that usually occurs 1 to 2 days after surgery

B. Assessment

1. Dyspnea and increased respiratory rate
2. Crackles over involved lung area
3. Elevated temperature
4. Productive cough and chest pain

C. Interventions

1. Assess lung sounds.
2. Reposition the client every 1 to 2 hours.
3. Encourage the client to deep-breathe, cough, and use the incentive spirometer as prescribed.
4. Provide chest physiotherapy and postural drainage, as prescribed.
5. Encourage fluid intake and early ambulation.
6. Use suction to clear secretions if the client is unable to cough.

IV. Hypoxemia

A. Description: An inadequate concentration of oxygen in arterial blood; in the postoperative client, hypoxemia can be due to shallow breathing from the effects of anesthesia or medications.

B. Assessment

1. Restlessness
2. Dyspnea
3. Diaphoresis
4. Tachycardia
5. Hypertension

6. Cyanosis
7. Low pulse oximetry readings

C. Interventions

1. Monitor for signs of hypoxemia.
2. Notify the surgeon.
3. Monitor lung sounds and pulse oximetry.
4. Administer oxygen as prescribed.
5. Encourage deep breathing and coughing and use of the incentive spirometer.
6. Turn and reposition the client frequently; encourage ambulation.

V. Pulmonary Embolism

A. Description: An embolus blocking the pulmonary artery and disrupting blood flow to 1 or more lobes of the lung

B. Assessment

1. Sudden dyspnea
2. Sudden sharp chest or upper abdominal pain
3. Cyanosis
4. Tachycardia
5. A drop in blood pressure

C. Interventions

1. Notify the surgeon immediately because pulmonary embolism may be life-threatening and requires emergency action.
2. Monitor vital signs.
3. Administer oxygen and medications as prescribed.

VI. Hemorrhage

A. Description: The loss of a large amount of blood externally or internally in a short time period

B. Assessment

1. Restlessness
2. Weak and rapid pulse
3. Hypotension
4. Tachypnea
5. Cool, clammy skin
6. Reduced urine output

C. Interventions

1. Provide pressure to the site of bleeding.
2. Notify the surgeon.
3. Administer oxygen, as prescribed.
4. Administer IV fluids and blood, as prescribed.
5. Prepare the client for a surgical procedure, if necessary.

VII. Shock

A. Description: Loss of circulatory fluid volume, which usually is caused by hemorrhage

B. Assessment: Similar to assessment findings in hemorrhage

C. Interventions

1. If shock develops, elevate the legs.
2. Notify the surgeon.
3. Determine and treat the cause of shock.
4. Administer oxygen, as prescribed.
5. Monitor level of consciousness.

6. Monitor vital signs for increased pulse or decreased blood pressure.
7. Monitor intake and output.
8. Assess color, temperature, turgor, and moisture of the skin and mucous membranes.
9. Administer IV fluids, blood, and colloid solutions, as prescribed.

 **If the client had spinal anesthesia, do not elevate the legs any higher than placing them on the pillow; otherwise, the diaphragm muscles needed for effective breathing could be impaired.**

VIII. Thrombophlebitis

A. Description

1. Thrombophlebitis is an inflammation of a vein, often accompanied by clot formation.
2. Veins in the legs are affected most commonly.

B. Assessment

1. Vein inflammation
2. Aching or cramping pain
3. Vein feels hard and cordlike and is tender to touch.
4. Elevated temperature

C. Interventions

1. Monitor legs for swelling, inflammation, pain, tenderness, venous distention, and cyanosis; notify the surgeon if any of these signs are present.
2. Elevate the extremity 30 degrees without allowing any pressure on the popliteal area.
3. Encourage the use of antiembolism stockings as prescribed; remove stockings twice a day to wash and inspect the legs.
4. Use a sequential compression device as prescribed (see Fig. 18-3).
5. Perform passive range-of-motion exercises every 2 hours if the client is confined to bed rest.
6. Encourage early ambulation, as prescribed.
7. Do not allow the client to dangle the legs.
8. Instruct the client not to sit in 1 position for an extended period of time.
9. Administer anticoagulants such as heparin sodium or enoxaparin, as prescribed.

IX. Urinary Retention

A. Description

1. Urinary retention is an involuntary accumulation of urine in the bladder as a result of loss of muscle tone.
2. It is caused by the effects of anesthetics or opioid analgesics and appears 6 to 8 hours after surgery.

B. Assessment

1. Inability to void
2. Restlessness and diaphoresis
3. Lower abdominal pain
4. Distended bladder
5. Hypertension
6. On percussion, bladder sounds like a drum.

C. Interventions

1. Monitor for voiding.
2. Assess for a distended bladder by palpation and bladder scanning if indicated.
3. Encourage ambulation when prescribed.
4. Encourage fluid intake unless contraindicated.
5. Assist the client to void by helping the client to stand.
6. Provide privacy.
7. Pour warm water over the perineum or allow the client to hear running water to promote voiding.
8. Contact the surgeon and catheterize the client as prescribed after all noninvasive techniques have been attempted.

X. Constipation

A. Description

1. Constipation is an abnormal infrequent passage of stool.
2. When the client resumes a solid diet postoperatively, failure to pass stool within 48 hours may indicate constipation.

B. Assessment

1. Absence of bowel movements
2. Abdominal distention
3. Anorexia, headache, and nausea

C. Interventions

1. Assess bowel sounds.
2. Encourage fluid intake up to 3000 mL/day unless contraindicated.
3. Encourage early ambulation.
4. Encourage consumption of fiber foods unless contraindicated.
5. Provide privacy and adequate time for bowel elimination.
6. Administer stool softeners and laxatives, as prescribed.

XI. Paralytic Ileus

A. Description

1. Paralytic ileus is failure of appropriate forward movement of bowel contents.
2. The condition may occur as a result of anesthetic medications or of manipulation of the bowel during the surgical procedure.

B. Assessment

1. Vomiting postoperatively
2. Abdominal distention
3. Absence of bowel sounds, bowel movement, or flatus

C. Interventions

1. Monitor intake and output.
2. Maintain NPO status until bowel sounds return.
3. Maintain patency of a nasogastric tube if in place; assess patency and drainage per agency procedure.
4. Encourage ambulation.

5. Administer IV fluids or parenteral nutrition, as prescribed.
6. Administer medications as prescribed to increase gastrointestinal motility and secretions.
7. If ileus occurs, it is treated first nonsurgically with bowel decompression by insertion of a nasogastric tube attached to intermittent or constant suction.

 Vomiting postoperatively, abdominal distention, and absence of bowel sounds may be signs of paralytic ileus.

XII. Wound Infection

A. Description

1. Wound infection may be caused by poor aseptic technique or a contaminated wound before surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk.
2. Infection usually occurs 3 to 6 days after surgery.

3. Purulent material may exit from the drains or separated wound edges.
- ### B. Assessment
1. Fever and chills
 2. Warm, tender, painful, and inflamed incision site
 3. Edematous skin at the incision and tight skin sutures
 4. Elevated white blood cell count
- ### C. Interventions
1. Monitor temperature.
 2. Monitor incision site for approximation of suture line, edema, or bleeding, and signs of infection (REEDA: redness, erythema, ecchymosis, drainage, approximation of the wound edges); notify the surgeon if signs of wound infection are present.
 3. Maintain patency of drains, and assess drainage amount, color, and consistency.
 4. Maintain asepsis, change the dressing, and perform wound irrigation, if prescribed ([Box 18-6](#)).
 5. Administer antibiotics, as prescribed.

BOX 18-6 Procedure for Sterile Dressing Change and Wound Irrigation*

Verify the prescription for the procedure in the medical record. Anticipate supplies that will be needed and gather supplies, including personal protective equipment (PPE) and additional equipment needed for protection (i.e., gown, face shield, clean gloves), a sterile dressing change kit if available, and any anticipated additional supplies such as gauze pads, drain sponges, cotton tipped applicators, tape, an abdominal pad, a measuring tool, syringe for irrigation, irrigation basin, extra pair of sterile gloves, and underpad.

Introduce self to client, identify the client with 2 accepted identifiers and compare against medical record, provide privacy, and explain the procedure.

Assess the client's pain level using an appropriate pain scale and medicate as necessary.

Assess the client for allergies, particularly to tape or latex.

Perform hand hygiene and don PPE.

Position the client appropriately, apply clean gloves, and place the underpad underneath the client.

Remove the soiled dressing, assess and characterize drainage noted on the dressing, and discard the removed dressing in the biohazard waste; note: if a moist-to-dry dressing adheres to the wound, gently free the dressing and warn the client of the discomfort; if a dry dressing adheres to the wound that is not to be debrided, moisten the dressing with normal saline and remove.

Assess the wound and periwound for size (length, width, depth; measure using measuring tool), appearance, color, drainage, edema, approximation, granulation tissue, presence and condition of drains, and odor; and palpate edges for tenderness or pain.

Cover the wound with sterile gauze by opening a sterile gauze pack and lightly placing the gauze on the wound without touching the dressing material; remove gloves and perform hand hygiene.

Set up the sterile field: prepare sterile equipment using sterile technique on an overbed table. If irrigation is prescribed, pour any prescribed irrigation solution into a sterile basin and draw solution into the irrigating syringe. Gently irrigate the wound with the prescribed solution from the least contaminated area to the most contaminated area. Use an approved irrigation basin to collect solution from the irrigating procedure.

Cleanse the wound with sterile gauze from the least contaminated area to the most contaminated area, using single-stroke motions. Discard the gauze from each stroke and use a new one for the next stroke. If drains are present, use cotton tipped applicators to hold drains up and clean around drain sites using circular strokes, starting near the drain and moving outward from the insertion site using cotton tipped applicators or sterile gauze. Dry sites in the same manner using sterile gauze.

Apply any prescribed wound antiseptic with a cotton-tipped applicator or sterile gauze, using the same technique as when cleansing the wound.

Dress the wound with the prescribed dressings using sterile technique and secure in place.

Date/time/initial the dressing and discard supplies as indicated per agency procedures, and remove gloves.

Assist the client to a comfortable position and ensure safety; assess pain level.

Document the procedure, any related assessments, client response, and any additional procedural responses.

Adapted from Perry A, Potter P, Ostendorf W: Clinical nursing skills and techniques, ed 8, St. Louis, 2014, Mosby.

*Note: Adapt procedure if irrigation is not prescribed or if the client does not have drains or tubes in place. Always follow agency procedures for dressing changes and wound irrigations.

FIGURE 18-5 Complications of wound healing.

XIII. Wound Dehiscence and Evisceration (Fig. 18-5)

A. Description

1. Wound dehiscence is separation of the wound edges at the suture line; it usually occurs 6 to 8 days after surgery.
2. Wound evisceration is protrusion of the internal organs through an incision; it usually occurs 6 to 8 days after surgery.
3. Evisceration is most common among obese clients, clients who have had abdominal surgery, or those who have poor wound-healing ability.
4. Wound evisceration is an emergency.

B. Assessment: Dehiscence

1. Increased drainage
2. Opened wound edges
3. Appearance of underlying tissues through the wound

C. Assessment: Evisceration

1. Discharge of serosanguineous fluid from a previously dry wound
2. The appearance of loops of bowel or other abdominal contents through the wound
3. Client reports feeling a popping sensation after coughing or turning.

D. Interventions (see [Priority Nursing Actions](#))

XIV. Ambulatory Care or 1-Day Stay Surgical Units

A. General criteria for client discharge

1. Is alert and oriented.
2. Has voided.
3. Has no respiratory distress.
4. Is able to ambulate, swallow, and cough.
5. Has minimal pain.
6. Is not vomiting.
7. Has minimal, if any, bleeding from the incision site.

⚡ PRIORITY NURSING ACTIONS

Evisceration in a Wound

1. Call for help; ask that the surgeon be notified and that needed supplies be brought to the client's room.
2. Stay with the client.
3. While waiting for supplies to arrive, place the client in a low Fowler's position with the knees bent.
4. Cover the wound with a sterile normal saline dressing and keep the dressing moist.
5. Take vital signs and monitor the client closely for signs of shock.
6. Prepare the client for surgery as necessary.
7. Document the occurrence, actions taken, and the client's response.

Wound evisceration is protrusion of the internal organs through an incision; it usually occurs 6 to 8 days after surgery. Evisceration is most common among obese clients, clients who have had abdominal surgery, or those who have poor wound-healing ability. Wound evisceration is an emergency. The nurse immediately calls for help and asks that the surgeon be notified and that needed supplies (vital sign measurement devices, sterile normal saline, and dressings) be brought to the client's room. The nurse stays with the client and while waiting for supplies to arrive, places the client in a low Fowler's position with the knees bent to prevent abdominal tension on the abdominal suture line. The nurse covers the wound with a sterile normal saline dressing as soon as supplies are available and keeps the dressing moist. Vital signs are monitored closely, and the client is monitored for signs of shock. The client is prepared for surgery if necessary. The nurse also documents the occurrence, actions taken, and client's response.

Reference

Perry, Potter, Ostendorf (2014), pp. 925–926.

8. Has a responsible adult available to drive the client home.
 9. The surgeon has signed a release form.
- #### B. Discharge teaching ([Box 18-7](#))
1. Discharge teaching should be performed before the date of the scheduled procedure.
 2. Provide written instructions to the client and family regarding the specifics of care.
 3. Instruct the client and family about postoperative complications that can occur.
 4. Provide appropriate resources for home care support.
 5. Instruct the client not to drive, make important decisions, or sign any legal documents for 24 hours after receiving general anesthesia.
 6. Instruct the client to call the surgeon, ambulatory center, or emergency department if postoperative problems occur.
 7. Instruct the client to keep follow-up appointments with the surgeon.

BOX 18-7 Postoperative Discharge Teaching

Assess the client's readiness to learn, educational level, and desire to change or modify lifestyle.

Assess the need for resources needed for home care.

Demonstrate care of the incision and how to change the dressing.

Instruct the client to cover the incision with plastic if showering is allowed.

Ensure that the client is provided with a 48-hour supply of dressings for home use.

Instruct the client on the importance of returning to the surgeon's office for follow-up.

Instruct the client that sutures usually are removed in the surgeon's office 7 to 10 days after surgery.

Inform the client that staples are removed 7 to 14 days after surgery and that the skin may become slightly reddened when staples are ready to be removed.

Sterile adhesive strips (e.g., Steri-Strips[®]) may be applied to provide extra support after the sutures are removed.

Instruct the client on the use of medications, their purpose, dosages, administration, and side effects or adverse effects.

Instruct the client on diet and to drink 6 to 8 glasses of liquid a day.

Instruct the client about activity levels and to resume normal activities gradually.

Instruct the client to avoid lifting for 6 weeks if a major surgical procedure was performed.

Instruct the client with an abdominal incision not to lift anything weighing 10 pounds or more and not to engage in any activities that involve pushing or pulling.

The client usually can return to work in 6 to 8 weeks depending on the procedure and as prescribed by the surgeon.

Instruct the client about the signs and symptoms of complications and when to call the surgeon.

CRITICAL THINKING What Should You Do?

Answer: Nursing responsibilities with regard to informed consent for a surgical procedure include witnessing the client's signing of the consent form, but the nurse must be sure that the client has understood the surgeon's explanation of the surgery. The nurse needs to document the witnessing of the signing of the consent form after the client acknowledges understanding the procedure. If the client informs the nurse that the explanation was not fully understood, the nurse must notify the surgeon and the surgeon will need to clarify anything that was not understood by the client.

Reference: Lewis et al. (2014), pp. 325–326.

PRACTICE QUESTIONS

168. The nurse has just reassessed the condition of a postoperative client who was admitted 1 hour ago to the surgical unit. The nurse plans to monitor which parameter most carefully during the next hour?
 1. Urinary output of 20 mL/hour
 2. Temperature of 37.6 °C (99.6 °F)
 3. Blood pressure of 100/70 mm Hg
 4. Serous drainage on the surgical dressing
169. The nurse is teaching a client about coughing and deep-breathing techniques to prevent postoperative complications. Which statement is most appropriate for the nurse to make to the client at this time as it relates to these techniques?
 1. "Use of an incentive spirometer will help prevent pneumonia."
 2. "Close monitoring of your oxygen saturation will detect hypoxemia."
 3. "Administration of intravenous fluids will prevent or treat fluid imbalance."
 4. "Early ambulation and administration of blood thinners will prevent pulmonary embolism."
170. The nurse is creating a plan of care for a client scheduled for surgery. The nurse should include which activity in the nursing care plan for the client on the day of surgery?
 1. Avoid oral hygiene and rinsing with mouthwash.
 2. Verify that the client has not eaten for the last 24 hours.
 3. Have the client void immediately before going into surgery.
 4. Report immediately any slight increase in blood pressure or pulse.
171. A client with a gastric ulcer is scheduled for surgery. The client cannot sign the operative consent form because of sedation from opioid analgesics that have been administered. The nurse should take which most appropriate action in the care of this client?
 1. Obtain a court order for the surgery.
 2. Have the charge nurse sign the informed consent immediately.
 3. Send the client to surgery without the consent form being signed.
 4. Obtain a telephone consent from a family member, following agency policy.
172. A preoperative client expresses anxiety to the nurse about upcoming surgery. Which response by the nurse is most likely to stimulate further discussion between the client and the nurse?
 1. "If it's any help, everyone is nervous before surgery."
 2. "I will be happy to explain the entire surgical procedure to you."
 3. "Can you share with me what you've been told about your surgery?"
 4. "Let me tell you about the care you'll receive after surgery and the amount of pain you can anticipate."

173. The nurse is conducting preoperative teaching with a client about the use of an incentive spirometer. The nurse should include which piece of information in discussions with the client?
1. Inhale as rapidly as possible.
 2. Keep a loose seal between the lips and the mouthpiece.
 3. After maximum inspiration, hold the breath for 15 seconds and exhale.
 4. The best results are achieved when sitting up or with the head of the bed elevated 45 to 90 degrees.
174. The nurse has conducted preoperative teaching for a client scheduled for surgery in 1 week. The client has a history of arthritis and has been taking acetylsalicylic acid. The nurse determines that the client needs additional teaching if the client makes which statement?
1. "Aspirin can cause bleeding after surgery."
 2. "Aspirin can cause my ability to clot blood to be abnormal."
 3. "I need to continue to take the aspirin until the day of surgery."
 4. "I need to check with my health care provider about the need to stop the aspirin before the scheduled surgery."
175. The nurse assesses a client's surgical incision for signs of infection. Which finding by the nurse would be interpreted as a normal finding at the surgical site?
1. Red, hard skin
 2. Serous drainage
 3. Purulent drainage
 4. Warm, tender skin
176. The nurse is monitoring the status of a postoperative client in the immediate postoperative period. The nurse would become most concerned with which sign that could indicate an evolving complication?
1. Increasing restlessness
 2. A pulse of 86 beats/minute
 3. Blood pressure of 110/70 mm Hg
 4. Hypoactive bowel sounds in all 4 quadrants
- ❖ 177. A client who has had abdominal surgery complains of feeling as though "something gave way" in the incisional site. The nurse removes the dressing and notes the presence of a loop of bowel protruding through the incision. Which interventions should the nurse take? Select all that apply.
- 1. Contact the surgeon.
 - 2. Instruct the client to remain quiet.
 - 3. Prepare the client for wound closure.
 - 4. Document the findings and actions taken.
 - 5. Place a sterile saline dressing and ice packs over the wound.
 - 6. Place the client in a supine position without a pillow under the head.
178. A client who has undergone preadmission testing has had blood drawn for serum laboratory studies, including a complete blood count, coagulation studies, and electrolytes and creatinine levels. Which laboratory result should be reported to the surgeon's office by the nurse, knowing that it could cause surgery to be postponed?
1. Hemoglobin, 8.0 g/dL (80 mmol/L)
 2. Sodium, 145 mEq/L (145 mmol/L)
 3. Serum creatinine, 0.8 mg/dL (70.6 $\mu\text{mol/L}$)
 4. Platelets, 210,000 cells/mm³ (210 $\times 10^3/\mu\text{L}$ / 210 $\times 10^9/\text{L}$)
179. The nurse receives a telephone call from the post-anesthesia care unit stating that a client is being transferred to the surgical unit. The nurse plans to take which action first on arrival of the client?
1. Assess the patency of the airway.
 2. Check tubes or drains for patency.
 3. Check the dressing to assess for bleeding.
 4. Assess the vital signs to compare with preoperative measurements.
180. The nurse is reviewing a surgeon's prescription sheet for a preoperative client that states that the client must be nothing by mouth (NPO) after midnight. The nurse should call the surgeon to clarify that which medication should be given to the client and not withheld?
1. Prednisone
 2. Ferrous sulfate
 3. Cyclobenzaprine
 4. Conjugated estrogen

ANSWERS

168. 1

Rationale: Urine output should be maintained at a minimum of 30 mL/hour for an adult. An output of less than 30 mL for 2 consecutive hours should be reported to the health care provider. A temperature higher than 37.7 °C (100 °F) or lower than

36.1 °C (97 °F) and a falling systolic blood pressure, lower than 90 mm Hg, are usually considered reportable immediately. The client's preoperative or baseline blood pressure is used to make informed postoperative comparisons. Moderate or light serous drainage from the surgical site is considered normal. Test-Taking Strategy: Note the **strategic word**, most. Focus on the **subject**, expected postoperative assessment findings. To

answer this question correctly, you must know the normal ranges for temperature, blood pressure, urinary output, and wound drainage. Note that the urinary output is the only observation that is not within the normal range.

Review: **Postoperative assessment**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Clinical Judgment; Perfusion

Reference: Ignatavicius, Workman (2016), p. 262.

169. 1

Rationale: Postoperative respiratory problems are atelectasis, pneumonia, and pulmonary emboli. Pneumonia is the inflammation of lung tissue that causes productive cough, dyspnea, and lung crackles and can be caused by retained pulmonary secretions. Use of an incentive spirometer helps to prevent pneumonia and atelectasis. Hypoxemia is an inadequate concentration of oxygen in arterial blood. While close monitoring of the oxygen saturation will help to detect hypoxemia, monitoring is not directly related to coughing and deep-breathing techniques. Fluid imbalance can be a deficit or excess related to fluid loss or overload, and surgical clients are often given intravenous fluids to prevent a deficit; however, this is not related to coughing and deep breathing. Pulmonary embolus occurs as a result of a blockage of the pulmonary artery that disrupts blood flow to 1 or more lobes of the lung; this is usually due to clot formation. Early ambulation and administration of blood thinners helps to prevent this complication; however, it is not related to coughing and deep-breathing techniques.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **subject**, client instructions related to coughing and deep-breathing techniques. Also, focus on the **data in the question** and note the relationship between the words coughing and deep-breathing in the question and pneumonia in the correct option.

Review: **Postoperative complications**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Client Education; Gas Exchange

Reference: Perry, Potter, Ostendorf (2014), pp. 597-599, 893.

170. 3

Rationale: The nurse would assist the client to void immediately before surgery so that the bladder will be empty. Oral hygiene is allowed, but the client should not swallow any water. The client usually has a restriction of food and fluids for 6 to 8 hours (or longer as prescribed) before surgery instead of 24 hours. A slight increase in blood pressure and pulse is common during the preoperative period and is usually the result of anxiety.

Test-Taking Strategy: Focus on the **subject**, preoperative care measures. Think about the measures that may be helpful and promote comfort. Oral hygiene should be administered since it may make the client feel more comfortable. A client should be nothing by mouth (NPO) for 6 to 8 hours before surgery

rather than 24 hours. A slight increase in blood pressure or pulse is insignificant in this situation.

Review: **Preoperative care**

Level of Cognitive Ability: Creating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Clinical Judgment; Palliation

Reference: Ignatavicius, Workman (2016), p. 234.

171. 4

Rationale: Every effort should be made to obtain permission from a responsible family member to perform surgery if the client is unable to sign the consent form. A telephone consent must be witnessed by 2 persons who hear the family member's oral consent. The 2 witnesses then sign the consent with the name of the family member, noting that an oral consent was obtained. Consent is not informed if it is obtained from a client who is confused, unconscious, mentally incompetent, or under the influence of sedatives. In an emergency, a client may be unable to sign and family members may not be available. In this situation, a health care provider is permitted legally to perform surgery without consent, but the data in the question do not indicate an emergency. Options 1, 2, and 3 are not appropriate in this situation. Also, agency policies regarding informed consent should always be followed.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **data in the question**. Eliminate options 1 and 3 first. Option 1 will delay necessary surgery and option 3 is inappropriate. Option 2 is not an acceptable and legal role of a charge nurse. Select option 4 since it is the only legally acceptable option: to obtain a telephone permission from a family member if it is witnessed by 2 persons.

Review: The procedures for obtaining **informed consent**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Ethics; Health Care Law

Reference: Lewis et al. (2014), pp. 325-326, 784.

172. 3

Rationale: Explanations should begin with the information that the client knows. By providing the client with individualized explanations of care and procedures, the nurse can assist the client in handling anxiety and fear for a smooth preoperative experience. Clients who are calm and emotionally prepared for surgery withstand anesthesia better and experience fewer postoperative complications. Option 1 does not focus on the client's anxiety. Explaining the entire surgical procedure may increase the client's anxiety. Option 4 avoids the client's anxiety and is focused on postoperative care.

Test-Taking Strategy: Note that the client expresses anxiety. Use knowledge of **therapeutic communication techniques**. Note that the question contains **strategic words**, most likely, and also note the words stimulate further discussion. Also use the **steps of the nursing process**. The correct option addresses assessment and is the only therapeutic response.

Review: **Therapeutic communication techniques**

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity
 Integrated Process: Communication and Documentation
 Content Area: Fundamentals of Care—Perioperative Care
 Priority Concepts: Anxiety; Communication
 References: Lewis et al. (2014), p. 319; Perry, Potter, Ostendorf (2014), p. 31.

173. 4

Rationale: For optimal lung expansion with the incentive spirometer, the client should assume the semi-Fowler's or high Fowler's position. The mouthpiece should be covered completely and tightly while the client inhales slowly, with a constant flow through the unit. The breath should be held for 5 seconds before exhaling slowly.

Test-Taking Strategy: Focus on the **subject**, correct use of an incentive spirometer, and visualize the procedure. Note the words rapidly, loose, and 15 seconds in the incorrect options. Options 1, 2, and 3 are incorrect steps regarding incentive spirometer use.

Review: **Incentive spirometry**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Teaching and Learning
 Content Area: Fundamentals of Care—Perioperative Care
 Priority Concepts: Client Education; Gas Exchange
 Reference: Perry, Potter, Ostendorf (2014), pp. 597–599, 893.

174. 3

Rationale: Antiplatelets alter normal clotting factors and increase the risk of bleeding after surgery. Aspirin has properties that can alter platelet aggregation and should be discontinued at least 48 hours before surgery. However, the client should always check with his or her health care provider regarding when to stop taking the aspirin when a surgical procedure is scheduled. Options 1, 2, and 4 are accurate client statements.

Test-Taking Strategy: Note the **strategic words**, needs additional teaching. These words indicate a **negative event query** and that you need to select the incorrect client statement. Eliminate options 1 and 2 first because they are **comparable or alike**. From the remaining options, recalling that aspirin has properties that can alter platelet aggregation will direct you to the correct option.

Review: **Antiplatelet medications** in the preoperative period
 Level of Cognitive Ability: Evaluating
 Client Needs: Physiological Integrity
 Integrated Process: Teaching and Learning
 Content Area: Fundamentals of Care—Perioperative Care
 Priority Concepts: Client Education; Clotting
 Reference: Ignatavicius, Workman (2016), p. 228.

175. 2

Rationale: Serous drainage is an expected finding at a surgical site. The other options indicate signs of wound infection. Signs and symptoms of infection include warm, red, and tender skin around the incision. Wound infection usually appears 3 to 6 days after surgery. The client also may have a fever and chills. Purulent material may exit from drains or from separated wound edges. Infection may be caused by poor aseptic technique or a contaminated wound before surgical exploration; existing client conditions such as diabetes mellitus or immunocompromise may place the client at risk.

Test-Taking Strategy: Focus on the **subject**, normal findings in the postoperative period. Eliminate options 1, 3, and 4 because they are **comparable or alike** and are manifestations of infection.

Review: **Postoperative assessment**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Fundamentals of Care—Perioperative Care
 Priority Concepts: Infection; Tissue Integrity
 Reference: Ignatavicius, Workman (2016), p. 264.

176. 1

Rationale: Increasing restlessness is a sign that requires continuous and close monitoring because it could indicate a potential complication, such as hemorrhage, shock, or pulmonary embolism. A blood pressure of 110/70 mm Hg with a pulse of 86 beats/minute is within normal limits. Hypoactive bowel sounds heard in all 4 quadrants are a normal occurrence in the immediate postoperative period.

Test-Taking Strategy: Note the **strategic word**, most. Focus on the **subject**, a manifestation of an evolving complication in the immediate postoperative period. Eliminate each of the incorrect options because they are **comparable or alike** and are normal expected findings, especially given the time frame noted in the question.

Review: **Postoperative assessment**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Analysis
 Content Area: Fundamentals of Care—Perioperative Care
 Priority Concepts: Clinical Judgment; Safety
 Reference: Ignatavicius, Workman (2016), pp. 260-261, 741.

❖ 177. 1, 2, 3, 4

Rationale: Wound dehiscence is the separation of the wound edges. Wound evisceration is protrusion of the internal organs through an incision. If wound dehiscence or evisceration occurs, the nurse should call for help, stay with the client, and ask another nurse to contact the surgeon and obtain needed supplies to care for the client. The nurse places the client in a low Fowler's position, and the client is kept quiet and instructed not to cough. Protruding organs are covered with a sterile saline dressing. Ice is not applied because of its vasoconstrictive effect. The treatment for evisceration is usually immediate wound closure under local or general anesthesia. The nurse also documents the findings and actions taken.

Test-Taking Strategy: Focus on the **subject**, that the client is experiencing wound evisceration. Visualizing this occurrence will assist you in determining that the client would not be placed supine and that ice packs would not be placed on the incision.

Review: **Evisceration**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Fundamentals of Care—Perioperative Care
 Priority Concepts: Clinical Judgment; Tissue Integrity
 Reference: Ignatavicius, Workman (2016), p. 264.

178. 1

Rationale: Routine screening tests include a complete blood count, serum electrolyte analysis, coagulation studies, and a serum creatinine test. The complete blood count includes the hemoglobin analysis. All of these values are within normal range except for hemoglobin. If a client has a low hemoglobin level, the surgery likely could be postponed by the surgeon.

Test-Taking Strategy: Focus on the **subject**, an abnormal laboratory result that needs to be reported. Use knowledge of the normal reference intervals to assist in answering correctly. The hemoglobin value is the only abnormal laboratory finding.

Review: **Normal laboratory reference levels**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Clinical Judgment; Collaboration

Reference: Lewis et al. (2014), pp. 325, 626.

179. 1

Rationale: The first action of the nurse is to assess the patency of the airway and respiratory function. If the airway is not patent, the nurse must take immediate measures for the survival of the client. The nurse then takes vital signs followed by checking the dressing and the tubes or drains. The other nursing actions should be performed after a patent airway has been established.

Test-Taking Strategy: Note the **strategic word**, first. Use the principles of prioritization to answer this question. Use the **ABCs—airway, breathing, and circulation**. Ensuring airway patency is the first action to be taken, directing you to the correct option.

Review: **Postoperative care**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Care Coordination; Clinical Judgment

Reference: Ignatavicius, Workman (2016), p. 258.

180. 1

Rationale: Prednisone is a corticosteroid. With prolonged use, corticosteroids cause adrenal atrophy, which reduces the ability of the body to withstand stress. When stress is severe, corticosteroids are essential to life. Before and during surgery, dosages may be increased temporarily and may be given parenterally rather than orally. Ferrous sulfate is an oral iron preparation used to treat iron deficiency anemia. Cyclobenzaprine is a skeletal muscle relaxant. Conjugated estrogen is an estrogen used for hormone replacement therapy in postmenopausal women. These last 3 medications may be withheld before surgery without undue effects on the client.

Test-Taking Strategy: Focus on the **subject**, the medication that should be administered in the preoperative period. Use knowledge about medications that may have special implications for the surgical client. Prednisone is a corticosteroid. Recall that when stress is severe, such as with surgery, corticosteroids are essential to life.

Review: **Corticosteroids** in the preoperative period

Level of Cognitive Ability: Analyzing

Positioning Clients

PRIORITY CONCEPT Mobility, Safety

CRITICAL THINKING What Should You Do?

The nurse is caring for a client who is receiving intermittent tube feedings via a nasogastric tube. In maintaining proper positioning for this client, what actions should the nurse take?
Answer located on p. 234.

For reference throughout the chapter, please see Figures 19-1, Figure 19-2, Figure 19-3, and Figure 19-4.

FIGURE 19-1 Bed positions.

I. Guidelines for Positioning

A. Client safety and comfort

1. Position client in a safe and appropriate manner to provide safety and comfort.
2. Select a position that will prevent the development of complications related to an existing condition, prescribed treatment, or medical or surgical procedure.

B. Ergonomic principles related to body mechanics (Box 19-1)

! Always review the health care provider's (HCP's) prescription, especially after treatments or procedures, and take note of instructions regarding positioning and mobility.

BOX 19-1 Body Mechanics (Ergonomic Principles) for Health Care Workers

When planning to move a client, arrange for adequate help.
Use mechanical aids if help is unavailable.
Encourage the client to assist as much as possible.
Keep the back, neck and pelvis, and feet aligned. Avoid twisting.
Flex knees, and keep feet wide apart.
Raise the client's bed so that the client's weight is at the level of the nurse's center of gravity.
Position self close to the client (or object being lifted).
Use arms and legs (not back).
Slide client toward yourself, using a pull sheet. When transferring a client onto a stretcher, a slide board is more appropriate.
Set (tighten) abdominal and gluteal muscles in preparation for the move.
Person with the heaviest load coordinates efforts of the team involved by counting to 3.

Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby. Perry, Potter, Ostendorf (2014), pp. 197-198. St. Louis: Mosby.

II. Positions to Ensure Safety and Comfort

A. Integumentary system

1. Autograft: After surgery, the site is immobilized usually for 3 to 7 days to provide the time needed for the graft to adhere and attach to the wound bed.
2. Burns of the face and head: Elevate the head of the bed to prevent or reduce facial, head, and tracheal edema.
3. Circumferential burns of the extremities: Elevate the extremities above the level of the heart to prevent or reduce dependent edema.
4. Skin graft: Elevate and immobilize the graft site to prevent movement and shearing of the graft and disruption of tissue; avoid weight-bearing.

B. Reproductive system

1. Mastectomy
 - a. Position the client with the head of the bed elevated at least 30 degrees (semi-Fowler's

FIGURE 19-2 Lithotomy position for examination.

- position), with the affected arm elevated on a pillow to promote lymphatic fluid return after the removal of axillary lymph nodes.
 - b. Turn the client only to the back and unaffected side.
2. Perineal and vaginal procedures: Place the client in the lithotomy position.

Lateral (side-lying) position

Semiprone (Sims' or forward side-lying) position

Supine position

Prone position.
The client's arms and shoulders may be positioned in internal or external rotation.

FIGURE 19-3 Client positions.

FIGURE 19-4 Pressure points in lying and sitting positions.

C. Endocrine system

1. Hypophysectomy: Elevate the head of the bed to prevent increased intracranial pressure.
2. Thyroidectomy
 - a. Place the client in the semi-Fowler's to **Fowler's position** to reduce swelling and edema in the neck area.
 - b. Sandbags or pillows or other stabilization devices may be used to support the client's head or neck.
 - c. Avoid neck extension to decrease tension on the suture line.

D. Gastrointestinal system

1. Hemorrhoidectomy: Assist the client to a **lateral (side-lying) position** to prevent pain and bleeding.
2. Gastroesophageal reflux disease: **Reverse Trendelenburg's position** may be prescribed to promote gastric emptying and prevent esophageal reflux.
3. Liver biopsy (see **Priority Nursing Actions**)

4. Paracentesis: Client is usually positioned in a semi-Fowler's position in bed, or sitting upright on the side of the bed or in a chair with the feet supported; client is assisted to a position of comfort following the procedure.
5. Nasogastric tube
 - a. Insertion
 - (1) Position the client in a **high Fowler's position** with the head tilted forward.
 - (2) This position will help to close the trachea and open the esophagus.
 - b. Irrigations and tube feedings
 - (1) Elevate the head of the bed (semi-Fowler's to Fowler's position) to prevent aspiration.
 - (2) Maintain head elevation for 30 minutes to 1 hour (per agency procedure) after an intermittent feeding.
 - (3) The head of the bed should remain elevated for continuous feedings.

⚡ PRIORITY NURSING ACTIONS

Liver Biopsy

1. Explain the procedure to the client.
2. Ensure that informed consent has been obtained.
3. Position the client supine, with the right side of the upper abdomen exposed; the client's right arm is raised and extended behind the head and over the left shoulder.
4. Remain with the client during the procedure.
5. After the procedure, assist the client into a right lateral (side-lying) position and place a small pillow or folded towel under the puncture site.
6. Monitor vital signs closely after the procedure and monitor for signs of bleeding.
7. Document appropriate information about the procedure, client's tolerance, and postprocedure assessment findings.

For the client undergoing liver biopsy (or any invasive procedure), the procedure is explained to the client and informed consent is obtained by the health care provider performing the procedure. Since the liver is located on the right side of the upper abdomen, the client is positioned supine, with the right side of the upper abdomen exposed. In addition, the right arm is raised and extended behind the head and over the left shoulder. This position provides for maximal exposure of the right intercostal spaces. The nurse remains with the client during the procedure to provide emotional support and comfort. After the procedure, the client is assisted into a right lateral (side-lying) position and a small pillow or folded towel is placed under the puncture site for at least 3 hours or as prescribed, to provide pressure to the site and prevent bleeding. Vital signs are monitored closely after the procedure and the client is monitored for signs of bleeding. The nurse documents appropriate information about the procedure, the client's tolerance, and postprocedure assessment findings.

Reference

Lewis et al. (2014), pp. 882–883.

! If the client receiving a continuous tube feeding needs to be placed in a supine position when providing care, such as when giving a bed bath or changing linens, shut off the feeding to prevent aspiration. Remember to turn the feeding back on and check the rate of flow when the client is placed back into the semi-Fowler's or Fowler's position.

6. Rectal enema and irrigations: Place the client in the left **Sims' position** to allow the solution to flow by gravity in the natural direction of the colon.
7. Sengstaken-Blakemore and Minnesota tubes
 - a. Not commonly used because they are uncomfortable for the client and can cause complications, but their use may be necessary when other interventions are not feasible.
 - b. If prescribed, maintain elevation of the head of the bed to enhance lung expansion and reduce portal blood flow, permitting effective esophagogastric balloon tamponade.

E. Respiratory system

1. Chronic obstructive pulmonary disease: In advanced disease, place the client in a sitting position, leaning forward, with the client's arms over several pillows or an overbed table; this position will assist the client to breathe easier.
2. Laryngectomy (radical neck dissection): Place the client in a semi-Fowler's or Fowler's position to maintain a patent airway and minimize edema.
3. Bronchoscopy postprocedure: Place the client in a semi-Fowler's position to prevent choking or aspiration resulting from an impaired ability to swallow.

4. Postural drainage: The lung segment to be drained should be in the uppermost position; **Trendelenburg's position** may be used.
5. Thoracentesis
 - a. During the procedure, to facilitate removal of fluid from the pleural space, position the client sitting on the edge of the bed and leaning over the bedside table with the feet supported on a stool, or lying in bed on the unaffected side with the client in Fowler's position.
 - b. After the procedure, assist the client to a position of comfort.

 **Always check the HCP's prescription regarding positioning for the client who had a thoracotomy, lung wedge resection, lobectomy of the lung, or pneumonectomy.**

F. Cardiovascular system

1. Abdominal aneurysm resection
 - a. After surgery, limit elevation of the head of the bed to 45 degrees to avoid flexion of the graft.
 - b. The client may be turned from side to side.
2. Amputation of the lower extremity
 - a. During the first 24 hours after amputation, elevate the foot of the bed (the residual limb is supported with pillows but not elevated because of the risk of flexion contractures) to reduce edema.
 - b. Consult with the HCP and, if prescribed, position the client in a **prone position** twice a day for a 20- to 30-minute period to stretch muscles and prevent flexion contractures of the hip.
3. Arterial vascular grafting of an extremity
 - a. To promote graft patency after the procedure, bed rest usually is maintained for approximately 24 hours and the affected extremity is kept straight.
 - b. Limit movement and avoid flexion of the hip and knee.
4. Cardiac catheterization
 - a. If the femoral vessel was accessed for the procedure, the client is maintained on bed rest for 4 to 6 hours (time for bed rest may vary depending on HCP preference and if a vascular closure device was used); the client may turn from side to side.
 - b. The affected extremity is kept straight and the head is elevated no more than 30 degrees (some HCPs prefer a lower head position or the flat position) until hemostasis is adequately achieved.

5. Heart failure and pulmonary edema: Position the client upright, preferably with the legs dangling over the side of the bed, to decrease venous return and lung congestion.

 **Most often, clients with respiratory and cardiac disorders should be positioned with the head of the bed elevated.**

6. Peripheral arterial disease
 - a. Obtain the HCP's prescription for positioning.
 - b. Because swelling can prevent arterial blood flow, clients may be advised to elevate their feet at rest, but they should not raise their legs above the level of the heart because extreme elevation slows arterial blood flow; some clients may be advised to maintain a slightly dependent position to promote perfusion.
 7. Deep vein thrombosis
 - a. If the extremity is red, edematous, and painful, traditional heparin sodium therapy may be initiated. Bed rest with leg elevation may also be prescribed for the client.
 - b. Clients receiving low-molecular-weight heparin usually can be out of bed after 24 hours if pain level permits.
 8. Varicose veins: Leg elevation above heart level usually is prescribed; the client also is advised to minimize prolonged sitting or standing during daily activities.
 9. Venous insufficiency and leg ulcers: Leg elevation usually is prescribed.
- #### G. Sensory system
1. Cataract surgery: Postoperatively, elevate the head of the bed (semi-Fowler's to Fowler's position) and position the client on the back or the nonoperative side to prevent the development of edema at the operative site.
 2. Retinal detachment
 - a. If the detachment is large, bed rest and bilateral eye patching may be prescribed to minimize eye movement and prevent extension of the detachment.
 - b. Restrictions in activity and positioning following repair of the detachment depends on the HCP's preference and the surgical procedure performed.
- #### H. Neurological system
1. Autonomic dysreflexia: Elevate the head of the bed to a high Fowler's position to assist with adequate ventilation and assist in the prevention of hypertensive stroke.

 **If autonomic dysreflexia occurs, immediately place the client in a high Fowler's position.**

2. Cerebral aneurysm: Bed rest is maintained with the head of the bed elevated 30 to 45 degrees to prevent pressure on the aneurysm site.
3. Cerebral angiography
 - a. Maintain bed rest for the length of time as prescribed.
 - b. The extremity into which the contrast medium was injected is kept straight and immobilized for about 6 to 8 hours.
4. Stroke (brain attack)
 - a. In clients with hemorrhagic strokes, the head of the bed is usually elevated to 30 degrees to reduce intracranial pressure and to facilitate venous drainage.
 - b. For clients with ischemic strokes, the head of the bed is usually kept flat.
 - c. Maintain the head in a midline, neutral position to facilitate venous drainage from the head.
 - d. Avoid extreme hip and neck flexion; extreme hip flexion may increase intrathoracic pressure, whereas extreme neck flexion prohibits venous drainage from the brain.
5. Craniotomy
 - a. The client should not be positioned on the site that was operated on, especially if the bone flap has been removed, because the brain has no bony covering on the affected site.
 - b. Elevate the head of the bed 30 to 45 degrees and maintain the head in a midline, neutral position to facilitate venous drainage from the head.
 - c. Avoid extreme hip and neck flexion.
6. Laminectomy and other vertebral surgery
 - a. Logroll the client.
 - b. When the client is out of bed, the client's back is kept straight (the client is placed in a straight-backed chair) with the feet resting comfortably on the floor.
7. Increased intracranial pressure
 - a. Elevate the head of the bed 30 to 45 degrees and maintain the head in a midline, neutral position to facilitate venous drainage from the head.
 - b. Avoid extreme hip and neck flexion.

 **Do not place a client with a head injury in a flat or Trendelenburg's position because of the risk of increased intracranial pressure.**
8. Lumbar puncture
 - a. During the procedure, assist the client to the lateral (side-lying) position, with the back bowed at the edge of the examining table, the knees flexed up to the abdomen, and the neck flexed so that the chin is resting on the chest.
 - b. After the procedure, place the client in the **supine position** for 4 to 12 hours, as prescribed.
9. Spinal cord injury
 - a. Immobilize the client on a spinal backboard, with the head in a neutral position, to prevent incomplete injury from becoming complete.
 - b. Prevent head flexion, rotation, or extension; the head is immobilized with a firm, padded cervical collar.
 - c. Logroll the client; no part of the body should be twisted or turned, nor should the client be allowed to assume a sitting position.

I. Musculoskeletal system

1. Total hip replacement
 - a. Positioning depends on the surgical techniques used (anterior or posterior approach), the method of implantation, the prosthesis, and surgeon's preference.
 - b. Avoid extreme internal and external rotation.
 - c. Avoid adduction; in most cases side-lying is permitted as long as an abduction pillow is in place; some surgeons allow turning to only 1 side.
 - d. Maintain abduction when the client is in a supine position or positioned on the nonoperative side.
 - e. Place a wedge (abduction) pillow between the client's legs to maintain abduction; instruct the client not to cross the legs
 - f. Check the HCP's prescriptions regarding elevation of the head of the bed and hip flexion.
2. Devices used to promote proper positioning (Box 19-2)

CRITICAL THINKING What Should You Do?

Answer: For the client receiving intermittent tube feedings via a nasogastric tube, the nurse should position the client in an upright (semi-Fowler's or high Fowler's) position during the feeding and for 30 minutes to 1 hour following the feeding, per agency procedure. Positioning the client in an upright position prevents aspiration of the formula. For the client receiving a continuous tube feeding, an upright position should be maintained at all times.

Reference: Perry, Potter, Ostendorf (2014), p. 778.

BOX 19-2 Devices Used for Proper Positioning**Bed Boards**

These plywood boards are placed under the entire surface area of the mattress and are useful for increasing back support and body alignment.

Foot Boots

Foot boots are made of rigid plastic or heavy foam and keep the foot flexed at the proper angle. They should be removed 2 or 3 times a day to assess skin integrity and joint mobility.

Hand Rolls

Hand rolls maintain the fingers in a slightly flexed and functional position and keep the thumb slightly adducted in opposition to the fingers.

Hand-Wrist Splints

These splints are individually molded for the client to maintain proper alignment of the thumb in slight adduction and the wrist in slight dorsiflexion.

Pillows

Pillows provide support, elevate body parts, splint incisional areas, and reduce postoperative pain during activity, coughing, or deep breathing. They should be of the appropriate size for the body part to be positioned.

Sandbags

Sandbags are soft devices filled with a substance that can be shaped to body contours to provide support. They immobilize extremities and maintain specific body alignment.

Side Rails

These bars, positioned along the sides of the length of the bed, ensure client safety and are useful for increasing mobility. They also provide assistance in rolling from side to side or sitting up in bed. Laws regarding the use of side rails vary state to state and these laws must be followed; therefore, agency policies must be followed.

Trapeze Bar

This bar descends from a securely fastened overhead bar attached to the bed frame. It allows the client to use the upper extremities to raise the trunk off the bed, assists in transfer from the bed to a wheelchair, and helps the client to perform upper arm–strengthening exercises.

Trochanter Rolls

These rolls prevent external rotation of the legs when the client is in the supine position. To form a roll, use a cotton bath blanket or a sheet folded lengthwise to a width extending from the greater trochanter of the femur to the lower border of the popliteal space.

Wedge Pillow

This triangular pillow is made of heavy foam and is used to maintain the legs in abduction following total hip replacement surgery.

Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby.

PRACTICE QUESTIONS

181. A client is being prepared for a thoracentesis. The nurse should assist the client to which position for the procedure?
1. Lying in bed on the affected side
 2. Lying in bed on the unaffected side
 3. Sims' position with the head of the bed flat
 4. Prone with the head turned to the side and supported by a pillow
- ❖ 182. The nurse is caring for a client following a craniotomy, in which a large tumor was removed from the left side. In which position can the nurse safely place the client? Refer to the figures in options 1 to 4.

183. The nurse creates a plan of care for a client with deep vein thrombosis. Which client position or activity in the plan should be included?
1. Out-of-bed activities as desired
 2. Bed rest with the affected extremity kept flat
 3. Bed rest with elevation of the affected extremity
 4. Bed rest with the affected extremity in a dependent position
184. The nurse is caring for a client who is 1 day postoperative for a total hip replacement. Which is the best position in which the nurse should place the client?
1. Side-lying on the operative side
 2. On the nonoperative side with the legs abducted
 3. Side-lying with the affected leg internally rotated
 4. Side-lying with the affected leg externally rotated

185. The nurse is providing instructions to a client and the family regarding home care after right eye cataract removal. Which statement by the client would indicate an understanding of the instructions?
1. “I should sleep on my left side.”
 2. “I should sleep on my right side.”
 3. “I should sleep with my head flat.”
 4. “I should not wear my glasses at any time.”
186. The nurse is administering a cleansing enema to a client with a fecal impaction. Before administering the enema, the nurse should place the client in which position?
1. Left Sims’ position
 2. Right Sims’ position
 3. On the left side of the body, with the head of the bed elevated 45 degrees
 4. On the right side of the body, with the head of the bed elevated 45 degrees
187. A client has just returned to a nursing unit after an above-knee amputation of the right leg. The nurse should place the client in which position?
1. Prone
 2. Reverse Trendelenburg’s
 3. Supine, with the residual limb flat on the bed
 4. Supine, with the residual limb supported with pillows
188. The nurse is caring for a client with a severe burn who is scheduled for an autograft to be placed on the lower extremity. The nurse creates a postoperative plan of care for the client and should include which intervention in the plan?
1. Maintain the client in a prone position.
 2. Elevate and immobilize the grafted extremity.
 3. Maintain the grafted extremity in a flat position.
 4. Keep the grafted extremity covered with a blanket.
189. The nurse is preparing to care for a client who has returned to the nursing unit following cardiac catheterization performed through the femoral vessel. The nurse checks the health care provider’s (HCP’s) prescription and plans to allow which client position or activity following the procedure?
1. Bed rest in high Fowler’s position
 2. Bed rest with bathroom privileges only
 3. Bed rest with head elevation at 60 degrees
 4. Bed rest with head elevation no greater than 30 degrees
190. The nurse is preparing to insert a nasogastric tube into a client. The nurse should place the client in which position for insertion?
1. Right side
 2. Low Fowler’s
 3. High Fowler’s
 4. Supine with the head flat

ANSWERS

181. 2

Rationale: To facilitate removal of fluid from the chest, the client is positioned sitting at the edge of the bed leaning over the bedside table, with the feet supported on a stool; or lying in bed on the unaffected side with the head of the bed elevated 30 to 45 degrees. The prone and Sims’ positions are inappropriate positions for this procedure.

Test-Taking Strategy: Focus on the **subject**, positioning for thoracentesis. To perform a thoracentesis safely, the site must be visible to the health care provider (HCP) performing the procedure. The client should be placed in a position where he or she is as comfortable as possible with access to the affected side. A prone position would not give the HCP access to the chest. Lying on the affected side would prevent access to the site.

Review: Positioning for **thoracentesis**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Diagnostic Tests

Priority Concepts: Clinical Judgment; Safety

References: Lewis et al. (2014), pp. 493, 550; Perry, Potter, Ostendorf (2014), p. 1110.

❖ 182. 1

Rationale: Clients who have undergone craniotomy should have the head of the bed elevated 30 to 45 degrees to promote venous drainage from the head. The client is positioned to avoid extreme hip or neck flexion and the head is maintained in a midline neutral position. The client should not be positioned on the site that was operated on, especially if the bone flap was removed, because the brain has no bony covering on the affected site. A flat position or Trendelenburg’s position would increase intracranial pressure. A reverse Trendelenburg’s position would not be helpful and may be uncomfortable for the client.

Test-Taking Strategy: Focus on the **subject**, positioning following craniotomy. Remember that a primary concern is the risk for increased intracranial pressure. Therefore, use concepts related to gravity and preventing edema and increased intracranial pressure to answer this question.

Review: Positioning following **craniotomy**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Intracranial Regulation; Safety

Reference: Ignatavicius, Workman (2016), p. 960.

183. 3

Rationale: For the client with deep vein thrombosis, elevation of the affected leg facilitates blood flow by the force of gravity and also decreases venous pressure, which in turn relieves edema and pain. A flat or dependent position of the leg would not achieve this goal. Bed rest is indicated to prevent emboli and to prevent pressure fluctuations in the venous system that occur with walking.

Test-Taking Strategy: Focus on the **subject**, the safe position or activity for the client with deep vein thrombosis. Think about the pathophysiology associated with this disorder and the principles related to gravity flow and edema to answer the question.

Review: Positioning for a **venous disorder**

Level of Cognitive Ability: Creating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Fundamentals of Care—Safety

Priority Concepts: Perfusion; Safety

Reference: Ignatavicius, Workman (2016), p. 731.

184. 2

Rationale: Positioning following a total hip replacement depends on the surgical techniques used, the method of implantation, the prosthesis, and the health care provider's (HCP's) preference. Abduction is maintained when the client is in a supine position or positioned on the nonoperative side. Internal and external rotation, adduction, or side-lying on the operative side (unless specifically prescribed by the HCP) is avoided to prevent displacement of the prosthesis.

Test-Taking Strategy: Focus on the **strategic word**, best. Use knowledge regarding care of clients following total hip replacement to answer this question. After a total hip replacement, the client should never have the extremity internally or externally rotated. Lying on the surgical side can cause damage to the surgical replacement site.

Review: Positioning after **total hip replacement**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Mobility; Safety

Reference: Lewis et al. (2014), p. 1526.

185. 1

Rationale: After cataract surgery, the client should not sleep on the side of the body that was operated on to prevent edema formation and intraocular pressure. The client also should be placed in a semi-Fowler's position to assist in minimizing edema and intraocular pressure. During the day, the client may wear glasses or a protective shield; at night, the protective shield alone is sufficient.

Test-Taking Strategy: Focus on the **subject**, right cataract surgery. Use of the principles of gravity and edema formation will assist in answering this question. Remember to instruct the client to remain off the operative side and to rest with the head elevated to minimize edema formation. This will assist you when answering questions related to cataract surgery.

Review: Positioning following **cataract surgery**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Client Teaching; Sensory Perception

Reference: Lewis et al. (2014), pp. 393-394.

186. 1

Rationale: For administering an enema, the client is placed in a left Sims' position so that the enema solution can flow by gravity in the natural direction of the colon. The head of the bed is not elevated in the Sims' position.

Test-Taking Strategy: Focus on the **subject**, positioning for enema administration. Use knowledge regarding the anatomy of the bowel to answer the question. The descending colon is located on the lower left side of the body. The head of the bed should be flat during enema administration.

Review: **Enema** administration

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Skills

Priority Concepts: Elimination; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 853-854.

187. 4

Rationale: The residual limb is usually supported on pillows for the first 24 hours following surgery to promote venous return and decrease edema. After the first 24 hours, the residual limb usually is placed flat on the bed to reduce hip contracture. Edema also is controlled by limb-wrapping techniques. In addition, it is important to check health care provider prescriptions regarding positioning following amputation.

Test-Taking Strategy: Focus on the **subject**, positioning following amputation, and note that the client has just returned from surgery. Using basic principles related to immediate postoperative care and preventing edema will assist in directing you to the correct option.

Review: Positioning following **amputation**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Perioperative Care

Priority Concepts: Perfusion; Tissue Integrity

Reference: Lewis et al. (2014), p. 1532.

188. 2

Rationale: Autografts placed over joints or on lower extremities are elevated and immobilized following surgery for 3 to 7 days, depending on the surgeon's preference. This period of immobilization allows the autograft time to adhere and attach to the wound bed, and the elevation minimizes edema. Keeping the client in a prone position and covering the extremity with a blanket can disrupt the graft site.

Test-Taking Strategy: Focus on the **subject**, positioning following autograft. Use general postoperative principles; elevating the graft site will decrease edema to the graft. The client should not be placed in a prone position or have it covered after surgery since it can disrupt a graft easily.

Review: Positioning following **autograft**

Level of Cognitive Ability: Creating

Client Needs: Physiological Integrity
Integrated Process: Nursing Process—Planning
Content Area: Fundamentals of Care—Perioperative Care
Priority Concepts: Perfusion; Tissue Integrity
References: Ignatavicius, Workman (2016), p. 484.
Lewis et al. (2014), pp. 466–467.

189. 4

Rationale: After cardiac catheterization, the extremity into which the catheter was inserted is kept straight for 4 to 6 hours. The client is maintained on bed rest for 4 to 6 hours (time for bed rest may vary depending on the HCP's preference and on whether a vascular closure device was used) and the client may turn from side to side. The head is elevated no more than 30 degrees (although some HCPs prefer a lower position or the flat position) until hemostasis is adequately achieved.
Test-Taking Strategy: Focus on the **subject**, positioning following cardiac catheterization. Think about this diagnostic procedure and what it entails. Understanding that the head of the bed is never elevated more than 30 degrees and bathroom privileges are restricted in the immediate postcatheterization period will assist in answering this question.
Review: Positioning following **cardiac catheterization**

190. 3

Rationale: During insertion of a nasogastric tube, the client is placed in a sitting or high Fowler's position to facilitate insertion of the tube and reduce the risk of pulmonary aspiration if the client should vomit. The right side, and low Fowler's and supine positions place the client at risk for aspiration; in addition, these positions do not facilitate insertion of the tube.
Test-Taking Strategy: Focus on the **subject**, insertion of a nasogastric tube. Visualize each position and think about how it may facilitate insertion of the tube. Also, recall that a concern with insertion of a nasogastric tube is pulmonary aspiration. Placing the client in a high Fowler's position with his or her chin to the chest will decrease the risk of aspiration.
Review: Positioning for **nasogastric tube** insertion
Level of Cognitive Ability: Applying

Care of a Client with a Tube

PRIORITY CONCEPTS Caregiving, Safety

CRITICAL THINKING What Should You Do?

The nurse assesses a client with a closed chest tube drainage system. On inspection, the nurse notes that the system is cracked. What should the nurse do?

Answer located on p. 251.

I. Nasogastric Tubes

A. Description

1. These are tubes used to intubate the stomach.
2. The tube is inserted from the nose to the stomach.

B. Purpose

1. To decompress the stomach by removing fluids or gas to promote abdominal comfort
2. To allow surgical anastomoses to heal without distention
3. To decrease the risk of aspiration
4. To administer medications to clients who are unable to swallow
5. To provide nutrition by acting as a temporary feeding tube
6. To irrigate the stomach and remove toxic substances, such as in poisoning

C. Types of tubes

1. Levin tube (Fig. 20-1)
 - a. Single-lumen nasogastric tube
 - b. Used to remove gastric contents via intermittent suction or to provide tube feedings
2. Salem sump tube: A Salem sump is a double-lumen nasogastric tube with an air vent (pigtail) used for decompression with intermittent continuous suction (see Fig. 20-1).

! The air vent on a Salem sump tube is not to be clamped and is to be kept above the level of the stomach. If leakage occurs through the air vent, instill 30 mL of air into the air vent and irrigate the main lumen with normal saline (NS).

D. Intubation procedures (Box 20-1)

E. Irrigation

1. Assess placement before irrigating (see Box 20-1).
2. Perform irrigation every 4 hours to assess and maintain the patency of the tube.
3. Gently instill 30 to 50 mL of water or NS (depending on agency policy) with an irrigation syringe.
4. Pull back on the syringe plunger to withdraw the fluid to check patency; repeat if the tube flow is sluggish.

F. Removal of a nasogastric tube: Ask the client to take a deep breath and hold it; remove the tube slowly and evenly over the course of 3 to 6 seconds (coil the tube around the hand while removing it).

II. Gastrointestinal Tube Feedings

A. Types of tubes and anatomical placement

1. Nasogastric: Nose to stomach
2. Nasoduodenal-nasojejunal: Nose to duodenum or jejunum
3. Gastrostomy: Stomach
4. Jejunostomy: Jejunum

B. Types of administration

1. Bolus
 - a. A bolus resembles normal meal feeding patterns.
 - b. Formula is administered over a 30- to 60-minute period every 3 to 6 hours; the amount of formula and frequency can be recommended by the dietitian and is prescribed by the health care provider (HCP).
2. Continuous
 - a. Feeding is administered continually for 24 hours.
 - b. An infusion feeding pump regulates the flow.
3. Cyclical
 - a. Feeding is administered in the daytime or nighttime for approximately 8 to 16 hours.
 - b. An infusion feeding pump regulates the flow.
 - c. Feedings at night allow for more freedom during the day.

FIGURE 20-1 Comparison of design and function of selected gastrointestinal tubes.

C. Administration of feedings

1. Check the HCP's prescription and agency policy regarding residual amounts; usually, if the residual is less than 100 mL, feeding is administered; large-volume aspirates indicate delayed gastric emptying and place the client at risk for aspiration.
2. Assess bowel sounds; hold the feeding and notify the HCP if bowel sounds are absent.
3. Position the client in a high Fowler's position; if comatose, place in high Fowler's and on the right side.
4. Assess tube placement by aspirating gastric contents and measuring the pH (should be 3.5 or lower).
5. Aspirate all stomach contents (residual), measure the amount, and return the contents to the stomach to prevent electrolyte imbalances (unless the color or characteristics of the residual is abnormal or the amount is greater than 250 mL).
6. Warm the feeding to room temperature to prevent diarrhea and cramps.
7. Use an infusion feeding pump for continuous or cyclic feedings.
8. For bolus feeding, maintain the client in a high Fowler's position for 30 minutes after the feeding. Use an infusion pump or allow the feeding to infuse via gravity. Do not plunge the feeding into the stomach.
9. For a continuous feeding, keep the client in a semi-Fowler's position at all times.

BOX 20-1 Nasogastric Tubes: Intubation Procedures

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Position the client in a high Fowler's position with pillows behind the shoulders.
4. Determine which nostril is more patent.
5. Measure the length of the tube from the bridge of the nose to the earlobe to the xiphoid process and indicate this length with a piece of tape on the tube (remember the abbreviation NEX, which stands for nose, earlobe, and xiphoid process).
6. If the client is conscious and alert, have him or her swallow or drink water (follow agency procedure).
7. Lubricate the tip of the tube with water-soluble lubricant.
8. Gently insert the tube into the nasopharynx and advance the tube.
9. When the tube nears the back of the throat (first black measurement on the tube), instruct the client to swallow or drink sips of water (unless contraindicated). If resistance is met, slowly rotate and aim the tube downward and toward the closer ear; in the intubated or semiconscious client, flex the head toward the chest while passing the tube.
10. Immediately withdraw the tube if any change is noted in the client's respiratory status.
11. Following insertion, obtain an abdominal x-ray study to confirm placement of the tube.
12. Connect the tube to suction, to either the intermittent or the continuous suction setting, as prescribed if the purpose of the tube is for decompression.
13. Secure the tube to the client's nose with adhesive tape and to the client's gown (follow agency procedure and check for client allergy to tape).
14. Observe the client for nausea, vomiting, abdominal fullness, or distention and monitor gastric output.
15. Check residual volumes every 4 hours, before each feeding, and before giving medications. Aspirate all stomach contents (residual) and measure the amount. Reinstill residual contents to prevent excessive fluid and electrolyte losses, unless the residual contents appear abnormal or the volume is large (greater than 250 mL). Always follow agency procedure. Withhold a feeding if the residual amount is more than 100 mL or according to agency or nutritional consult recommendations.
16. Before the instillation of any substance through the tube (i.e., irrigation solution, feeding, medications), aspirate stomach contents and test the pH (a pH of 3.5 or lower indicates that the tip of the tube is in a gastric location).
17. If irrigation is indicated, use normal saline solution (check agency procedure).
18. Observe the client for fluid and electrolyte balance.
19. Instruct the client about movement to prevent nasal irritation and dislodgment of the tube.
20. On a daily basis, remove the adhesive tape that is securing the tube to the nose and clean and dry the skin, assessing for excoriation; then reapply the tape.

Note: Gastrostomy or jejunostomy tubes are surgically inserted. A dressing is placed at the site of insertion. The dressing needs to be removed, the skin needs to be cleansed (with a solution determined by the health care provider or agency procedure), and a new sterile dressing needs to be applied every 8 hours (or as specified by agency policy). The skin at the insertion site is checked for signs of excoriation, infection, or other abnormalities, such as leakage of the feeding solution. Adapted from Potter P, Perry A, Stockert P, Hall A: Fundamentals of nursing, ed 8, St. Louis, 2013, Mosby.

D. Precautions

 Always assess the placement of a gastrointestinal tube before instilling feeding solutions, medications, or any other solution. If the tube is incorrectly placed, the client is at risk for aspiration.

1. Change the feeding container and tubing every 24 hours or per agency policy.
2. Do not hang more solution than is required for a 4-hour period; this prevents bacterial growth.
3. Check the expiration date on the formula before administering.
4. Shake the formula well before pouring it into the container (feeding bag). Some feedings require the use of a bag in which formula is added, or require the use of bottles that feeding tubing can be attached to directly. The tubing sometimes has a Y-site connection so a regular flush can be programmed using the pump rather than using a piston syringe.
5. Always assess bowel sounds; do not administer any feedings if bowel sounds are absent.

6. Administer the feeding at the prescribed rate or via gravity flow (intermittent bolus feedings) with a 50- to 60-mL syringe with the plunger removed.
7. Gently flush with 30 to 50 mL of water or NS (depending on agency policy) using the irrigation syringe after the feeding.

E. Prevention of complications

1. Diarrhea
 - a. Assess the client for lactose intolerance.
 - b. Use fiber-containing feedings.
 - c. Administer feeding slowly and at room temperature.
2. Aspiration
 - a. Verify tube placement.
 - b. Do not administer the feeding if residual is more than 100 mL (check HCP's prescription and agency policy).
 - c. Keep the head of the bed elevated.
 - d. If aspiration occurs, suction as needed, assess respiratory rate, auscultate lung sounds, monitor temperature for aspiration pneumonia, and prepare to obtain a chest radiograph.

3. Clogged tube
 - a. Use liquid forms of medication, if possible.
 - b. Flush the tube with 30 to 50 mL of water or NS (depending on agency policy) before and after medication administration and before and after bolus feeding.
 - c. Flush with water every 4 hours for continuous feeding.
4. Vomiting
 - a. Administer feedings slowly and, for bolus feedings, make feeding last for at least 30 minutes.
 - b. Measure abdominal girth.
 - c. Do not allow the feeding bag to empty.
 - d. Do not allow air to enter the tubing.
 - e. Administer the feeding at room temperature.
 - f. Elevate the head of the bed.
 - g. Administer antiemetics as prescribed.

 **If the client vomits, stop the tube feeding and place the client in a side-lying position; suction the client as needed.**

- F. Administration of medications (see [Priority Nursing Actions](#))

III. Intestinal Tubes

A. Description

1. The intestinal tube is passed nasally into the small intestine.

2. It may be used to decompress the bowel or to remove accumulated intestinal secretions when other interventions to decompress the bowel are not effective.
 3. The tube enters the small intestine through the pyloric sphincter because of the weight of a small bag containing tungsten at the end.
- B. Types of tubes include the Cantor tube (single lumen) and the Miller-Abbott tube (double lumen) (see [Fig. 20-1](#)).
- C. Interventions
1. Assess the HCP's prescriptions and agency policy for advancement and removal of the tube and tungsten.
 2. Position the client on the right side to facilitate passage of the weighted bag in the tube through the pylorus of the stomach and into the small intestine.
 3. Do not secure the tube to the face with tape until it has reached final placement (may take several hours) in the intestines.
 4. Assess the abdomen during the procedure by monitoring drainage from the tube and the abdominal girth.
 5. If the tube becomes blocked, notify the HCP.
 6. To remove the tube, the tungsten is removed from the balloon portion of the tube with a

PRIORITY NURSING ACTIONS

Administering Medications via a Nasogastric, Gastrostomy, or Jejunostomy Tube

1. Check the health care provider's (HCP's) prescription.
2. Prepare the medication for administration.
3. Ensure that the medication prescribed can be crushed or is a capsule that can be opened; use elixir forms of medications if available.
4. Dissolve crushed medication or capsule contents in 15 to 30 mL of water.
5. Verify the client's identity and explain the procedure to the client.
6. Check tube placement and residual contents before instilling the medication; check for bowel sounds.
7. Pour medication into a catheter tip syringe that is attached to clamped tubing. Unclamp tubing immediately and allow medication to infuse via gravity.
8. Flush with 30 to 50 mL of water or normal saline (NS), depending on agency policy.
9. Clamp the tube for 30 to 60 minutes, depending on medication and agency policy.
10. Document the administration of the medication and any other appropriate information.

The nurse always checks the HCP's prescription before administering any medication to a client. Once the prescription is verified, the medication is prepared for administration. The nurse determines the reason for administration, checks for any contraindications to administering the medication, and checks for any potential interactions. When preparing medications

for administration through a nasogastric, gastrostomy, or jejunostomy tube, the nurse needs to ensure that the medication prescribed can be crushed or is a capsule that can be opened. Whole tablets or capsules cannot be administered through a tube because they can cause a tube blockage. Elixir forms of medications can also be used if available. The nurse then dissolves the crushed medication or capsule contents in 15 to 30 mL of water. Client identity is always verified before medication administration and the procedure is explained to the client. The nurse checks tube placement and residual contents before instilling the medication and checks for bowel sounds. The nurse also performs any additional assessments, such as checking the apical heart rate for cardiac medications or checking the blood pressure for antihypertensives. The medication is poured into a catheter tip syringe that is attached to clamped tubing. The tubing is unclamped immediately and the medication is allowed to infuse via gravity. The tube is flushed with 30 to 50 mL of water or NS (depending on agency policy) to ensure that all medication has been instilled. The tube is then clamped for 30 to 60 minutes (depending on the medication and agency policy) to ensure that it is absorbed (if the tube is not clamped and is reattached to suction, the medication will be aspirated out with the suction). The nurse then documents the administration of the medication and any other appropriate information.

Reference

Perry, Potter, Ostendorf (2014), pp. 501-503. St. Louis, Mosby.

syringe; the tube is removed gradually (6 inches [15 cm] every hour) as prescribed by the HCP.

IV. Esophageal and Gastric Tubes

A. Description

1. May be used to apply pressure against bleeding esophageal veins to control the bleeding when other interventions are not effective or they are contraindicated
2. Not used if the client has ulceration or necrosis of the esophagus or has had previous esophageal surgery because of the risk of rupture

B. Sengstaken-Blakemore tube and Minnesota tube (see Fig. 20-1)

1. The Sengstaken-Blakemore tube, used only occasionally, is a triple-lumen gastric tube with an inflatable esophageal balloon (compresses esophageal varices), an inflatable gastric balloon (applies pressure at the cardioesophageal junction), and a gastric aspiration lumen. A nasogastric tube also is inserted in the opposite naris to collect secretions that accumulate above the esophageal balloon.
2. More commonly used is the Minnesota tube, which is a modified Sengstaken-Blakemore tube with an additional lumen (a 4-lumen gastric tube) for aspirating esophagopharyngeal secretions.
3. A radiograph of the upper abdomen and chest confirms placement.

C. Interventions

1. Check patency and integrity of all balloons before insertion.
2. Label each lumen.
3. Place the client in the upright or Fowler's position for insertion.
4. Immediately after insertion, prepare for radiography to verify placement.
5. Maintain head elevation once the tube is in place.
6. Double-clamp the balloon ports to prevent air leaks.
7. Keep scissors at the bedside at all times; monitor for respiratory distress, and if it occurs, cut the tubes to deflate the balloons.
8. To prevent ulceration or necrosis of the esophagus, release esophageal pressure at intervals as prescribed and per agency policy.
9. Monitor for increased bloody drainage, which may indicate persistent bleeding and rupture of the varices.
10. Monitor for signs of esophageal rupture, which include a drop in blood pressure, increased heart rate, and back and upper abdominal pain. (Esophageal rupture is an emergency, and signs of esophageal rupture must be reported to the HCP immediately.)

V. Lavage Tubes

A. Description: Used to remove toxic substances from the stomach

B. Types of tubes

1. Lavacuator (see Fig. 20-1)
 - a. The Lavacuator is an orogastric tube with a large suction lumen and a smaller lavage-lumen that provides continuous suction.
 - b. Irrigation solution enters the lavage lumen while stomach contents are removed through the suction lumen.
2. Ewald tube: A single-lumen large tube used for rapid 1-time irrigation and evacuation

VI. Urinary and Renal Tubes

A. Types of urinary catheters

1. Single lumen: Usually used for straight catheterization to empty the client's bladder, obtain sterile urine specimens, or check the residual amount of urine after the client voids
2. Double lumen: Used when an indwelling catheter is needed for continuous bladder drainage; one lumen is for drainage and the other is for balloon inflation.
3. Triple lumen: Used when bladder irrigation and drainage is necessary; 1 lumen is for instilling the bladder irrigant solution, 1 lumen is for continuous bladder drainage, and 1 lumen is for balloon inflation.
4. Strict aseptic technique is necessary for insertion and care of the catheter.

B. Routine urinary catheter care

1. Use gloves and wash the perineal area with warm soapy water.
2. With the nondominant hand, pull back the labia or foreskin to expose the meatus (in the adult male, return the foreskin to its normal position).
3. Cleanse along the catheter with soap and water.
4. Anchor the catheter to the thigh.
5. Maintain the catheter bag below the level of the bladder.

C. Ureteral and nephrostomy tubes (Fig. 20-2)

1. Never clamp the tube.

FIGURE 20-2 Ureteral and nephrostomy tubes.

2. Maintain patency.
3. Irrigate only if prescribed by the HCP, using strict aseptic technique; a maximum of 5 mL of sterile NS is instilled slowly and gently.
4. If patency cannot be established with the prescribed irrigation, notify the HCP immediately.

D. Catheter insertion and removal (Box 20-2)

! If the client has a ureteral or nephrostomy tube, monitor output closely; urine output of less than 30 mL/hour or lack of output for more than 15 minutes should be reported to the HCP immediately.

BOX 20-2 Urinary Catheters: Insertion and Removal Procedures

Urinary Catheters: Insertion Procedure

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Place the client in position for catheterization:
 - Female: Assist to dorsal recumbent position (supine with knees flexed). Support legs with pillows to reduce muscle tension and promote comfort.
 - Male: Assist to supine position with thighs slightly abducted.
4. Wearing clean gloves, wash perineal area with soap and water as needed; dry thoroughly. Remove and discard gloves; perform hand hygiene.
5. Open outer wrapping of the catheter kit, remembering that all components of the catheterization tray are sterile (all supplies are arranged in the box in order of sequence of use).
6. Apply waterproof sterile drape (when packed as first item in tray).
7. Urinary catheter procedure with specifics for male and female:
 - a. Place a sterile drape with plastic side down under the client's buttocks.
 - b. Don sterile gloves using sterile technique.
 - c. Pick up fenestrated drape from tray. Allow it to unfold without touching nonsterile surface. Apply drape over perineum, exposing labia or penis.
 - d. While maintaining sterility, open packet of lubricant and squeeze out on sterile field. Lubricate catheter tip by dipping it into water-soluble gel, 2.5 to 5 cm (1 to 2 inches) for women and 12.5 to 17.5 cm (5 to 7 inches) for men. Attach prefilled syringe to balloon port. Prepare cotton balls or swab sticks for cleansing perineal area.
 - e. Remember with a sterile technique, the sterile field and gloved hands must be maintained above the level of the waist, the 1-inch (2.5 cm) border on the field is considered contaminated, and the nurse cannot turn his or her back to the field at any time.
 - f. Catheter insertion
 - Female: The female should be positioned in a dorsal recumbent position with the legs open to allow for full visualization and maintenance of the sterile field. With nondominant hand, fully expose urethral meatus by spreading labia, taking care to not allow the labia to close. Using forceps in sterile dominant hand, pick up cotton ball or swab sticks saturated with antiseptic solution, wiping from front to back (from clitoris toward anus). Using a new cotton ball or swab for each area you clean, wipe far labial fold, near labial fold, and directly over center of urethral meatus. Pick up and hold catheter 7.5 to 10 cm (3 to 4 inches) from catheter tip. Advance catheter a total of 7.5 cm (3 inches) in adult or until urine flows out of catheter end. When urine appears, advance catheter another 2.5 to 5 cm (1 to 2 inches). Do not use force to insert catheter.
 - Male: Use of square sterile drape is optional; you may apply fenestrated drape with fenestrated slit resting over penis. Grasp penis at shaft just below glans. (If client is not circumcised, retract foreskin with nondominant hand.) With dominant hand, pick up antiseptic-soaked cotton ball with forceps or swab stick and clean penis. Move cotton ball or swab in circular motion from urethral meatus down to base of glans. Repeat cleaning 2 more times, using clean cotton ball/stick each time. Pick up catheter with gloved dominant hand and insert catheter by lifting penis to position perpendicular to client's body and apply light traction. Advance catheter 17.5 to 22.5 cm (7 to 9 inches) in adult or until urine flows out of catheter end. Advance an additional 2.5 to 5 cm (1 to 2 inches) after urine appears. Lower penis and hold catheter securely in nondominant hand.
8. Inflate balloon fully per manufacturer's directions and gently pull back on the catheter until resistance is felt.
9. Secure catheter tubing to inner thigh with agency-approved securing device, such as a StatLock[®].
10. Record type and size of catheter inserted, amount of fluid used to inflate the balloon, characteristics and amount of urine, specimen collection if appropriate, client's response to procedure, and that teaching was completed.

Urinary Catheters: Removal Procedure

1. Follow agency procedures.
2. Explain the procedure and its potential discomfort to the client.
3. Position the client in the same position as during catheterization.
4. Remove the securing device and place the towel between a female client's thighs or over a male client's thighs.
5. Insert a 10-mL syringe into the balloon injection port. Slowly withdraw all of the solution to deflate the balloon totally.
6. After deflation, explain to the client that he or she may feel a burning sensation as the catheter is withdrawn. Pull the catheter out smoothly and slowly.
7. Assess the client's urinary function by noting the first voiding after catheter removal and documenting the time and amount of voiding for the next 24 hours.

VII. Respiratory System Tubes

A. Endotracheal tubes (Fig. 20-3)

1. Description

- The endotracheal tube is used to maintain a patent airway.
- Endotracheal tubes are indicated when the client needs mechanical ventilation.
- If the client requires an artificial airway for longer than 10 to 14 days, a tracheostomy may be created to avoid mucosal and vocal cord damage that can be caused by the endotracheal tube.
- The cuff (located at the distal end of the tube), when inflated, produces a seal between the trachea and the cuff to prevent aspiration and ensure delivery of a set tidal volume when mechanical ventilation is used; an inflated cuff also prevents air from passing to the vocal cords, nose, or mouth.
- The pilot balloon permits air to be inserted into the cuff, prevents air from escaping, and is used as a guideline for determining the presence or absence of air in the cuff.
- The universal adapter enables attachment of the tube to mechanical ventilation tubing or other types of oxygen delivery systems.
- Types of tubes: orotracheal and nasotracheal

2. Orotracheal tubes

- Inserted through the mouth; allows use of a larger diameter tube and reduces the work of breathing
- Indicated when the client has a nasal obstruction or a predisposition to epistaxis
- Uncomfortable and can be manipulated by the tongue, causing airway obstruction; an oral airway may be needed to keep the client from biting on the tube.

3. Nasotracheal tubes

- Inserted through a nostril; this smaller tube increases resistance and the client's work of breathing.
- Its use is avoided in clients with bleeding disorders.
- It is more comfortable for the client, and the client is unable to manipulate the tube with the tongue.

4. Interventions

- Placement is confirmed by chest x-ray film (correct placement is 1 to 2 cm above the carina).
- Assess placement by auscultating both sides of the chest while manually ventilating with a resuscitation (Ambu) bag (if breath sounds and chest wall movement are absent in the left side, the tube may be in the right main stem bronchus).
- Perform auscultation over the stomach to rule out esophageal intubation.
- If the tube is in the stomach, louder breath sounds will be heard over the stomach than over the chest, and abdominal distention will be present.
- Secure the tube with adhesive tape immediately after intubation.
- Monitor the position of the tube at the lip or nose.
- Monitor skin and mucous membranes.
- Suction the tube only when needed.
- The oral tube needs to be moved to the opposite side of the mouth daily to prevent pressure and necrosis of the lip and mouth area, prevent nerve damage, and facilitate inspection and cleaning of the mouth; moving the tube to the opposite side of the mouth should be done by 2 HCPs.

FIGURE 20-3 A, Endotracheal (ET) tube with inflated cuff. B, ET tubes with uninflated and inflated cuffs and syringe for inflation.

- j. Prevent dislodgment and pulling or tugging on the tube; suction, coughing, and speaking attempts by the client place extra stress on the tube and can cause dislodgment.
- k. Assess the pilot balloon to ensure that the cuff is inflated; maintain cuff inflation, which creates a seal and allows complete mechanical control of respiration.
- l. Monitor cuff pressures at least every 8 hours per agency procedure to ensure that they do not exceed 20 mm Hg (an aneroid pressure manometer is used to measure cuff pressures); minimal leak and occlusive techniques are used for cuff inflation to check cuff pressures.

 A resuscitation (Ambu) bag needs to be kept at the bedside of a client with an endotracheal tube or a tracheostomy tube at all times.

5. Minimal leak technique

- a. This is used for cuff inflation and checking cuff pressures for cuffs without pressure relief valves.
- b. Inflate the cuff until a seal is established; no harsh sound should be heard through a stethoscope placed over the trachea when the client breathes in, but a slight air leak on peak inspiration is present and can be heard.
- c. The client cannot make verbal sounds, and no air is felt coming out of the client's mouth.

6. Occlusive technique

- a. This is used for cuff inflation and checking cuff pressures for cuffs with pressure relief valves.
- b. Provides an adequate seal in the trachea at the lowest possible cuff pressure.
- c. Uses same procedure as minimal leak technique, without an air leak.

7. Extubation

- a. Hyperoxygenate the client and suction the endotracheal tube and the oral cavity.
- b. Place the client in a semi-Fowler's position.
- c. Deflate the cuff; have the client inhale and, at peak inspiration, remove the tube, suctioning the airway through the tube while pulling it out.
- d. After removal, instruct the client to cough and deep-breathe to assist in removing accumulated secretions in the throat.
- e. Apply oxygen therapy, as prescribed.
- f. Monitor for respiratory difficulty; contact the HCP if respiratory difficulty occurs.
- g. Inform the client that hoarseness or a sore throat is normal and that the client should limit talking if it occurs.

B. Tracheostomy

1. Description

- a. A tracheostomy is an opening made surgically directly into the trachea to establish an airway; a tracheostomy tube is inserted into

the opening and the tube attaches to the mechanical ventilator or another type of oxygen delivery device (Fig. 20-4).

- b. The tracheostomy can be temporary or permanent. (See Box 20-3 for types of tracheostomy tubes.)

2. Interventions

- a. Assess respirations and for bilateral breath sounds.
- b. Monitor arterial blood gases and pulse oximetry.
- c. Encourage coughing and deep breathing.
- d. Maintain a semi-Fowler's to high Fowler's position.
- e. Monitor for bleeding, difficulty with breathing, absence of breath sounds, and crepitus (subcutaneous emphysema), which are indications of hemorrhage or pneumothorax.
- f. Provide respiratory treatments as prescribed.
- g. Suction fluids as needed; hyperoxygenate the client before suctioning.
- h. If the client is allowed to eat, sit the client up for meals and ensure that the cuff is inflated (if the tube is not capped) for meals and for 1 hour after meals to prevent aspiration.
- i. Monitor cuff pressures as prescribed.
- j. Assess the stoma and secretions for blood or purulent drainage.
- k. Follow the HCP's prescriptions and agency policy for cleaning the tracheostomy site and inner cannula (many inner cannulas are disposable); usually, half-strength hydrogen peroxide is used.
 - l. Administer humidified oxygen as prescribed, because the normal humidification process is bypassed in a client with a tracheostomy.
- m. Obtain assistance in changing tracheostomy ties; after placing the new ties, cut and remove the old ties holding the tracheostomy in place (some securing devices are soft and made with Velcro to hold the tube in place).
- n. Keep a resuscitation (Ambu) bag, obturator, clamps, and spare tracheostomy tube of the same size at the bedside.

3. Complications of a tracheostomy (Table 20-1)

 Never insert a plug (cap) into a tracheostomy tube until the cuff is deflated and the inner cannula is removed; prior insertion prevents airflow to the client.

VIII. Chest Tube Drainage System

A. Description

- 1. The chest tube drainage system returns negative pressure to the intrapleural space.
- 2. The system is used to remove abnormal accumulations of air and fluid from the pleural space (Fig. 20-5).

FIGURE 20-4 Tracheostomy tubes. A, Double-lumen cuffed tracheostomy tube with disposable inner cannula. B, Single-lumen cannula cuffed tracheostomy tube. C, Double-lumen cuffed fenestrated tracheostomy tube with plug (red cap).

BOX 20-3 Some Types of Tracheostomy Tubes

Double-Lumen Tube

The double-lumen tube has the following parts:

Outer cannula—fits into the stoma and keeps the airway open.

The face plate indicates the size and type of tube and has small holes on both sides for securing the tube with tracheostomy ties or another device.

Inner cannula—fits snugly into the outer cannula and locks into place. It provides the universal adaptor for use with the ventilator and other respiratory therapy equipment. Some may be removed, cleaned, and reused; others are disposable.

Obturator—a stylet with a smooth end used to facilitate the direction of the tube when inserting or changing a tracheostomy tube. The obturator is removed immediately after tube placement and is always kept with the client and at the bedside in case of accidental decannulation.

Cuff—when inflated, seals the airway. The cuffed tube is used for mechanical ventilation, preventing aspiration of oral or gastric secretions, or for the client receiving a tube feeding to prevent aspiration. A pilot balloon attached to the outside of the tube indicates the presence or absence of air in the cuff.

Single-Lumen Tube

The single-lumen tube is similar to the double-lumen tube except that there is no inner cannula. More intensive nursing care is required with this tube because there is no inner cannula to ensure a patent lumen.

Fenestrated Tube

The fenestrated tube has a precut opening (fenestration) in the upper posterior wall of the outer cannula. The tube is used to wean the client from a tracheostomy by ensuring that the client can tolerate breathing through his or her natural airway before the entire tube is removed. This tube allows the client to speak.

Cuffed Fenestrated Tube

The cuffed fenestrated tube facilitates mechanical ventilation and speech and often is used for clients with spinal cord paralysis or neuromuscular disease who do not require ventilation at all times. When not on the ventilator, the client can have the cuff deflated and the tube capped (see Fig. 20-4 for cuffed fenestrated tube with red cap) for speech. A cuffed fenestrated tube is never used in weaning from a tracheostomy because the cuff, even fully deflated, may partially obstruct the airway.

TABLE 20-1 Complications of a Tracheostomy

Complication and Description	Manifestations	Management	Prevention
Tracheomalacia: Constant pressure exerted by the cuff causes tracheal dilation and erosion of cartilage	<ul style="list-style-type: none"> ■ An increased amount of air is required in the cuff to maintain the seal ■ A larger tracheostomy tube is required to prevent an air leak at the stoma ■ Food particles are seen in tracheal secretions ■ The client does not receive the set tidal volume on the ventilator 	<ul style="list-style-type: none"> ■ Monitor client; no special management is needed unless bleeding or airway problems occur 	<ul style="list-style-type: none"> ■ Use an uncuffed tube as soon as possible ■ Monitor cuff pressure and air volume closely to detect changes
Tracheal stenosis: Narrowed tracheal lumen is the result of scar formation from irritation of tracheal mucosa by the cuff	<ul style="list-style-type: none"> ■ Stenosis is usually seen after the cuff is deflated or the tracheostomy tube is removed ■ The client has increased coughing, inability to expectorate secretions, or difficulty breathing and talking 	<ul style="list-style-type: none"> ■ Tracheal dilation or surgical intervention is used 	<ul style="list-style-type: none"> ■ Prevent pulling of and traction on the tracheostomy tube ■ Properly secure the tube in the midline position ■ Maintain cuff pressure ■ Minimize oronasal intubation time
Tracheoesophageal fistula (TEF): Excessive cuff pressure causes erosion of the posterior wall of the trachea. A hole is created between the trachea and the anterior esophagus. The client at highest risk also has a nasogastric tube present	<p>Similar to tracheomalacia:</p> <ul style="list-style-type: none"> ■ Food particles are seen in tracheal secretions ■ Increased air in cuff is needed to achieve a seal ■ The client has increased coughing and choking while eating ■ The client does not receive the set tidal volume on the ventilator 	<ul style="list-style-type: none"> ■ Suction; manually administer oxygen by mask to prevent hypoxemia ■ Use a small soft feeding tube instead of a nasogastric tube for tube feedings ■ A gastrostomy or jejunostomy may be performed ■ Monitor the client with a nasogastric tube closely; assess for TEF and aspiration 	<ul style="list-style-type: none"> ■ Maintain cuff pressure ■ Monitor the amount of air needed for inflation to detect changes ■ Progress to a deflated or cuffless tube as soon as possible
Trachea–innominate artery fistula: A malpositioned tube causes its distal tip to push against the lateral wall of the trachea. Continued pressure causes necrosis and erosion of the innominate artery. This is a medical emergency	<ul style="list-style-type: none"> ■ The tracheostomy tube pulsates in synchrony with the heartbeat ■ There is heavy bleeding from the stoma ■ This is a life-threatening complication 	<ul style="list-style-type: none"> ■ Remove the tracheostomy tube immediately ■ Apply direct pressure to the innominate artery at the stoma site ■ Prepare the client for immediate repair surgery 	<ul style="list-style-type: none"> ■ Use the correct tube size and length, and maintain the tube in midline position ■ Prevent pulling or tugging of the tracheostomy tube ■ Immediately notify the health care provider (HCP) of a pulsating tube
Tube obstruction	<ul style="list-style-type: none"> ■ Difficulty breathing ■ Noisy respirations ■ Difficulty inserting the suction catheter ■ Thick, dry secretions ■ Unexplained peak pressures if client is on a mechanical ventilator 	<ul style="list-style-type: none"> ■ The HCP repositions or replaces the tube if obstruction occurs as a result of cuff prolapse over the end of the tube 	<ul style="list-style-type: none"> ■ Assist the client to cough and deep-breathe ■ Provide humidification and suctioning ■ Clean the inner cannula regularly
Tube dislodgment	<ul style="list-style-type: none"> ■ Difficulty breathing ■ Noisy respirations ■ Restlessness ■ Excessive coughing ■ Audible wheeze or stridor 	<ul style="list-style-type: none"> ■ Be familiar with institutional policy regarding replacement of a tracheostomy tube as a nursing procedure ■ During the first 72 hours following surgical placement of the tracheostomy, the nurse manually ventilates the client by using a manual resuscitation (Ambu) bag while another nurse calls the Rapid Response Team for help 	<ul style="list-style-type: none"> ■ Secure the tube in place ■ Minimize manipulation of and traction on the tube ■ Ensure that the client does not pull on the tube ■ Ensure that a tracheostomy tube of the same type and size is at the client's bedside

TABLE 20-1 Complications of a Tracheostomy—cont'd

Complication and Description	Manifestations	Management	Prevention
		<ul style="list-style-type: none"> ■ 72 hours following surgical placement of the tracheostomy: <ul style="list-style-type: none"> ■ Extend the client's neck and open the tissues of the stoma to secure the airway ■ Grasp the retention sutures (if they are present) to spread the opening ■ Use a tracheal dilator (curved clamp) to hold the stoma open ■ Prepare to insert a tracheostomy tube; place the obturator into the tracheostomy tube, replace the tube, and remove the obturator ■ Maintain ventilation by resuscitation (Ambu) bag ■ Assess airflow and bilateral breath sounds ■ If unable to secure an airway, call the Rapid Response Team and the anesthesiologist 	

From Ignatavicius D, Workman ML: Medical-surgical nursing: patient-centered collaborative care, ed 7, Philadelphia, 2013, Saunders.

FIGURE 20-5 Chest tube placement.

B. Drainage collection chamber (Fig. 20-6)

1. The drainage collection chamber is located where the chest tube from the client connects to the system.
2. Drainage from the tube drains into and collects in a series of calibrated columns in this chamber.

C. Water seal chamber (see Fig. 20-6)

1. The tip of the tube is underwater, allowing fluid and air to drain from the pleural space and preventing air from entering the pleural space.
2. Water oscillates (moves up as the client inhales and moves down as the client exhales).
3. Excessive bubbling indicates an air leak in the chest tube system.

D. Suction control chamber (see Fig. 20-6)

1. The suction control chamber provides the suction, which can be controlled to provide negative pressure to the chest.
2. This chamber is filled with various levels of water to achieve the desired level of suction; without this control, lung tissue could be sucked into the chest tube.
3. Gentle bubbling in this chamber indicates that there is suction and does not indicate that air is escaping from the pleural space.

E. Dry suction system (see Fig. 20-6)

1. This is another type of chest drainage system. Because this is a dry suction system, absence of bubbling is noted in the suction control chamber.
2. A knob on the collection device is used to set the prescribed amount of suction; then the wall suction source dial is turned until a small orange floater valve appears in the window on the device (when the orange floater valve is in the window, the correct amount of suction is applied).

FIGURE 20-6 Chest drainage system. A, Wet system. B, Dry system. (From Lewis et al., 2011. From Atrium Medical Corporation, Hudson, N.H.)

F. Portable chest drainage system: Small and portable chest drainage systems are also available and are dry systems that use a control flutter valve to prevent the backflow of air into the client's lung. Principles of gravity and pressure, and the nursing care involved, are the same for all types of systems, and these systems allow greater ambulation and allow the client to go home with the chest tubes in place.

G. Interventions

1. Collection chamber
 - a. Monitor drainage; notify the HCP if drainage is more than 70 to 100 mL/hour or if drainage becomes bright red or increases suddenly.
 - b. Mark the chest tube drainage in the collection chamber at 1- to 4-hour intervals, using a piece of tape.
2. Water seal chamber
 - a. Monitor for fluctuation of the fluid level in the water seal chamber.
 - b. Fluctuation in the water seal chamber stops if the tube is obstructed, if a dependent loop

exists, if the suction is not working properly, or if the lung has reexpanded.

- c. If the client has a known pneumothorax, intermittent bubbling in the water seal chamber is expected as air is drained from the chest, but continuous bubbling indicates an air leak in the system.
 - d. Notify the HCP if there is continuous bubbling in the water seal chamber.
3. Suction control chamber: Gentle (not vigorous) bubbling should be noted in the suction control chamber of a wet suction system.
 4. An occlusive sterile dressing is maintained at the insertion site.
 5. A chest radiograph assesses the position of the tube and determines whether the lung has reexpanded.
 6. Assess respiratory status and auscultate lung sounds. Assess chest tube dressing for drainage and palpate surrounding tissue for crepitus.
 7. Monitor for signs of extended pneumothorax or hemothorax.
 8. Keep the drainage system below the level of the chest and the tubes free of kinks, dependent loops, or other obstructions.
 9. Ensure that all connections are secure.
 10. Encourage coughing and deep breathing.
 11. Change the client's position frequently to promote drainage and ventilation.
 12. Do not strip or milk a chest tube unless specifically directed to do so by the HCP and if agency policy allows it.
 13. Keep a clamp (may be needed if the system needs to be changed) and a sterile occlusive dressing at the bedside at all times.
 14. Never clamp a chest tube without a written prescription from the HCP; also, determine agency policy for clamping a chest tube.
 15. If the drainage system cracks or breaks, insert the chest tube into a bottle of sterile water, remove the cracked or broken system, and replace it with a new system.
 16. Depending on the HCP's preference, when the chest tube is removed, the client may be asked to take a deep breath and hold it, and the tube is removed. Or, the client may be asked to take a deep breath, exhale, and bear down (Valsalva maneuver). A dry sterile dressing, petroleum gauze dressing, or Telfa dressing (depending on the HCP's preference) is taped in place after removal of the chest tube.

! If the chest tube is pulled out of the chest accidentally, pinch the skin opening together, apply an occlusive sterile dressing, cover the dressing with overlapping pieces of 2-inch (5 cm) tape, and call the HCP immediately.

CRITICAL THINKING What Should You Do?

Answer: If the nurse notes that the chest tube drainage system is cracked, the chest tube should be disconnected from the system and submerged in a bottle of sterile water in order to maintain the water seal. The system will then need to be replaced. A clamp should be kept at the bedside in case the system needs to be changed. However, the nurse should never clamp a chest tube without a written prescription from the health care provider and per agency policy. The drainage system (chest tube and bottle of sterile water) should also be maintained below the level of the chest if this complication occurs.

Reference: Ignatavicius, Workman, (2016), p. 579.

PRACTICE QUESTIONS

- ❖ 191. The nurse is preparing to administer medication using a client's nasogastric tube. Which actions should the nurse take before administering the medication? Select all that apply.
- 1. Check the residual volume.
 - 2. Aspirate the stomach contents.
 - 3. Turn off the suction to the nasogastric tube.
 - 4. Remove the tube and place it in the other nostril.
 - 5. Test the stomach contents for a pH indicating acidity.
192. The nurse is preparing to administer medication through a nasogastric tube that is connected to suction. To administer the medication, the nurse should take which action?
1. Position the client supine to assist in medication absorption.
 2. Aspirate the nasogastric tube after medication administration to maintain patency.
 3. Clamp the nasogastric tube for 30 to 60 minutes following administration of the medication.
 4. Change the suction setting to low intermittent suction for 30 minutes after medication administration.
193. The nurse is assessing for correct placement of a nasogastric tube. The nurse aspirates the stomach contents, checks the gastric pH, and notes a pH of 7.35. Based on this information, which action should the nurse take at this time?
1. Retest the pH using another strip.
 2. Document that the nasogastric tube is in the correct place.
 3. Check for placement by auscultating for air injected into the tube.
 4. Call the health care provider to request a prescription for a chest radiograph.
194. The nurse caring for a client with a chest tube turns the client to the side and the chest tube accidentally disconnects from the water seal chamber. Which initial action should the nurse take?
1. Call the health care provider (HCP).
 2. Place the tube in a bottle of sterile water.
 3. Replace the chest tube system immediately.
 4. Place a sterile dressing over the disconnection site.
195. The registered nurse is preparing to insert a nasogastric tube in an adult client. To determine the accurate measurement of the length of the tube to be inserted, the nurse should take which action?
1. Mark the tube at 10 inches (25.5 cm).
 2. Mark the tube at 32 inches (81 cm).
 3. Place the tube at the tip of the nose and measure by extending the tube to the earlobe and then down to the xiphoid process.
 4. Place the tube at the tip of the nose and measure by extending the tube to the earlobe and then down to the top of the sternum.
- ❖ 196. The nurse is assessing the functioning of a chest tube drainage system in a client who has just returned from the recovery room following a thoracotomy with wedge resection. Which are the expected assessment findings? Select all that apply.
- 1. Excessive bubbling in the water seal chamber
 - 2. Vigorous bubbling in the suction control chamber
 - 3. Drainage system maintained below the client's chest
 - 4. 50 mL of drainage in the drainage collection chamber
 - 5. Occlusive dressing in place over the chest tube insertion site
 - 6. Fluctuation of water in the tube in the water seal chamber during inhalation and exhalation
197. The nurse is assisting a health care provider with the removal of a chest tube. The nurse should instruct the client to take which action?
1. Stay very still.
 2. Exhale very quickly.
 3. Inhale and exhale quickly.
 4. Perform the Valsalva maneuver.
198. While changing the tapes on a newly inserted tracheostomy tube, the client coughs and the tube is dislodged. Which is the initial nursing action?
1. Call the health care provider to reinsert the tube.
 2. Grasp the retention sutures to spread the opening.
 3. Call the respiratory therapy department to reinsert the tracheostomy.
 4. Cover the tracheostomy site with a sterile dressing to prevent infection.

199. The nurse is caring for a client immediately after removal of the endotracheal tube. The nurse should report which sign immediately if experienced by the client?
1. Stridor
 2. Occasional pink-tinged sputum
 3. Respiratory rate of 24 breaths/minute
 4. A few basilar lung crackles on the right
200. The nurse checks for residual before administering a bolus tube feeding to a client with a nasogastric tube and obtains a residual amount of 150 mL. What is the most appropriate action for the nurse to take?
1. Hold the feeding and reinstill the residual amount.
 2. Reinstill the amount and continue with administering the feeding.
 3. Elevate the client's head at least 45 degrees and administer the feeding.
 4. Discard the residual amount and proceed with administering the feeding.
201. The nurse caring for a client with a pneumothorax and who has had a chest tube inserted notes continuous gentle bubbling in the water seal chamber. What action is most appropriate?
1. Do nothing, because this is an expected finding.
 2. Check for an air leak, because the bubbling should be intermittent.
 3. Increase the suction pressure so that the bubbling becomes vigorous.
 4. Clamp the chest tube and notify the health care provider immediately.
202. The nurse is inserting a nasogastric tube in an adult client. During the procedure, the client begins to cough and has difficulty breathing. What is the most appropriate action?
1. Insert the tube quickly.
 2. Notify the health care provider immediately.
 3. Remove the tube and reinsert it when the respiratory distress subsides.
 4. Pull back on the tube and wait until the respiratory distress subsides.

ANSWERS

❖ 191. 1, 2, 3, 5

Rationale: By aspirating stomach contents, the residual volume can be determined and the pH checked. A pH less than 3.5 verifies gastric placement. The suction should be turned off before the tubing is disconnected to check for residual volume; in addition, suction should remain off for 30 to 60 minutes following medication administration to allow for medication absorption. There is no need to remove the tube and place it in the other nostril in order to administer a feeding; in fact, this is an invasive procedure and is unnecessary.

Test-Taking Strategy: Focus on the **subject**, instilling medication into the nasogastric tube, and visualize the procedure when answering this question. Read each option carefully and eliminate option 4 because it is not necessary and is an invasive procedure.

Review: Medication administration via a **nasogastric tube**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Skills

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 502, 786-788.

192. 3

Rationale: If a client has a nasogastric tube connected to suction, the nurse should wait 30 to 60 minutes before reconnecting the tube to the suction apparatus to allow adequate time for medication absorption. The client should not be placed in the supine position because of the risk for aspiration. Aspirating the nasogastric tube will remove the medication just administered. Low intermittent suction also will remove the medication just administered.

Test-Taking Strategy: Eliminate options 2 and 4 first because these actions are **comparable or alike** and will produce the same effect of removing medication administered. The client should not be placed in a supine position due to the risk of reflux and aspiration.

Review: Medication administration via a **nasogastric tube**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Skills

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), pp. 501-502.

193. 4

Rationale: If the nasogastric tube is in the stomach, the pH of the contents will be acidic. Gastric aspirates have acidic pH values and should be 3.5 or lower. A pH of 7.35 indicates a neutral pH, which may indicate that the tube is no longer in the stomach. Based on this information, the nurse should call the health care provider to request a prescription for a chest radiograph to determine if placement is accurate. Retesting the pH using another strip is unnecessary and checking for placement by auscultating for air injected into the tube is not a definitive method of checking for tube placement. The nurse should not document that the tube is in the correct place because the data indicate this may not be the case.

Test-Taking Strategy: Note the **subject**, verifying correct tube placement. Recalling that gastric contents are acidic and the definitive methods of assessing for accurate tube placement will direct you to the correct option.

Review: Assessing placement of a **nasogastric tube**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Safety
 Priority Concepts: Clinical Judgment; Safety
 Reference: Perry, Potter, Ostendorf (2014), p. 784.

194. 2

Rationale: If the chest drainage system is disconnected, the end of the tube is placed in a bottle of sterile water held below the level of the chest. The HCP may need to be notified, but this is not the initial action. The system is replaced if it breaks or cracks or if the collection chamber is full. Placing a sterile dressing over the disconnection site will not prevent complications resulting from the disconnection.

Test-Taking Strategy: Note the **strategic word**, initial. This indicates that a nursing action is required that will prevent a serious complication as a result of the disconnection. Eliminate options 1 and 3 because these actions delay required and immediate intervention. From the remaining options, recalling the complications that can occur from a disconnection and the purpose of a chest tube system will direct you to option 2.

Review: Nursing actions related to **chest tube** complications

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Perry, Potter, Ostendorf (2014), p. 665.

195. 3

Rationale: Measuring the length of a nasogastric tube needed is done by placing the tube at the tip of the client's nose and extending the tube to the earlobe and then down to the xiphoid process. The average length for an adult is about 22 to 26 inches (56 to 66 cm). The remaining options identify incorrect procedures for measuring the length of the tube.

Test-Taking Strategy: Focus on the **subject**, insertion of a nasogastric tube, and visualize this procedure. Eliminate options 1 and 2 first because 10 inches (25.5 cm) is short and 32 inches (81 cm) is too long. Also, remember the abbreviation NEX, which stands for nose, earlobe, and xiphoid process, to assist in answering questions similar to this one.

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Fundamentals of Care—Skills

Priority Concepts: Clinical Judgment; Safety

Reference: Perry, Potter, Ostendorf (2014), p. 778.

❖ 196. 3, 4, 5, 6

Rationale: The bubbling of water in the water seal chamber indicates air drainage from the client and usually is seen when intrathoracic pressure is higher than atmospheric pressure, and may occur during exhalation, coughing, or sneezing. Excessive bubbling in the water seal chamber may indicate an air leak, an unexpected finding. Fluctuation of water in the tube in the water seal chamber during inhalation and exhalation is expected. An absence of fluctuation may indicate that the chest tube is obstructed or that the lung has reexpanded and that no more air is leaking into the pleural space. Gentle (not vigorous) bubbling should be noted in the suction control chamber. A

total of 50 mL of drainage is not excessive in a client returning to the nursing unit from the recovery room. Drainage that is more than 70 to 100 mL/hour is considered excessive and requires notification of the health care provider. The chest tube insertion site is covered with an occlusive (airtight) dressing to prevent air from entering the pleural space. Positioning the drainage system below the client's chest allows gravity to drain the pleural space.

Test-Taking Strategy: Focus on the **subject**, expected findings associated with chest tube drainage systems. Thinking about the physiology associated with the functioning of a chest tube drainage system will assist in answering this question. The words excessive bubbling and vigorous bubbling will assist in eliminating these assessment findings.

Review: **Chest tubes**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Adult Health/Respiratory

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Ignatavicius, Workman (2016), p. 579.

197. 4

Rationale: When the chest tube is removed, the client is asked to perform the Valsalva maneuver (take a deep breath, exhale, and bear down). The tube is quickly withdrawn, and an airtight dressing is taped in place. An alternative instruction is to ask the client to take a deep breath and hold the breath while the tube is removed.

Test-Taking Strategy: Focus on the **subject**, removal of a chest tube. Eliminate options 2 and 3 because they are **comparable or alike**. Next, visualize the procedure, client instructions, and the effect of each of the actions in the options to answer correctly.

Review: **Chest tube removal**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Adult Health/Respiratory

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Perry, Potter, Ostendorf (2014), pp. 669-670.

198. 2

Rationale: If the tube is dislodged accidentally, the initial nursing action is to grasp the retention sutures and spread the opening. If agency policy permits, the nurse then attempts to replace the tube immediately. Calling ancillary services or the health care provider will delay treatment in this emergency situation. Covering the tracheostomy site will block the airway.

Test-Taking Strategy: Note the **strategic word**, initial. Eliminate options 1 and 3 first because they are **comparable or alike** and will delay the immediate intervention needed. Covering the tracheostomy opening will block the airway.

Review: Management of complications of **tracheostomy**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Lewis et al. (2014), p. 510.

199. 1

Rationale: Following removal of the endotracheal tube the nurse monitors the client for respiratory distress. The nurse reports stridor to the health care provider (HCP) immediately. This is a high-pitched, coarse sound that is heard with the stethoscope over the trachea. Stridor indicates airway edema and places the client at risk for airway obstruction. Although the findings identified in the remaining options require monitoring, they do not require immediate notification of the HCP. Test-Taking Strategy: Note the **strategic word**, immediately. Recall that the primary concern after removal of an artificial airway is the client's inability to maintain a patent airway and breathe independently. Because stridor indicates laryngeal edema and possible airway obstruction, it is the symptom that must be reported immediately.

Review: **Endotracheal tube** removal

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Ignatavicius, Workman (2016), p. 622.

200. 1

Rationale: Unless specifically indicated, residual amounts greater than 100 mL require holding the feeding, but this is individualized and each agency's policy should be checked. The residual amount should be reinstilled unless it is greater than 250 mL or per agency policy. In addition, the feeding is not discarded unless its contents are abnormal in color or characteristics.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Note that the residual amount is 150 mL. Also note that options 2, 3, and 4 are **comparable or alike** and indicate administering the feeding.

Review: **Nasogastric tubes**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Clinical Judgment; Safety

References: Perry, Potter, Ostendorf (2014), pp. 790, 792.

201. 2

Rationale: Fluctuation with inspiration and expiration, not continuous bubbling, should be noted in the water seal chamber. Intermittent bubbling may be noted if the client has a known pneumothorax, but this should decrease as time goes on and as the pneumothorax begins to resolve. Therefore, the nurse should check for an air leak. If a wet chest drainage

system is used, bubbling would be continuous in the suction control chamber and not intermittent. In a dry system, there is no bubbling. Increasing the suction pressure only increases the rate of evaporation of water in the drainage system; in addition, increasing the suction can be harmful and is not done without a specific prescription to do so if using a wet system. Dry systems will allow for only a certain amount of suction to be applied; an orange bellow will appear in the suction window, indicating that the proper amount of suction has been applied. Chest tubes should be clamped only with a health care provider's prescription.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Think about the physiology associated with each chamber of the chest tube drainage system. Remember that continuous gentle bubbling in the suction control chamber is expected if a wet system is used, but this finding is not normal in the water seal chamber.

Review: Expected assessment findings associated with **chest tubes**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Adult Health/Respiratory

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Lewis et al. (2014), p. 546.

202. 4

Rationale: During the insertion of a nasogastric tube, if the client experiences difficulty breathing or any respiratory distress, withdraw the tube slightly, stop the tube advancement, and wait until the distress subsides. It is not necessary to notify the health care provider immediately or remove the tube completely. Quickly inserting the tube is not an appropriate action because, in this situation, it is likely that the tube has entered the bronchus.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Eliminate option 1 because of the word quickly. Visualizing the procedure and anticipating potential complications will assist in eliminating options 2 and 3 as necessary actions at this time. If a client has respiratory distress, the tube has entered the bronchus and insertion should not be continued. It is not necessary to remove the tube completely at this time.

Growth and Development Across the Life Span

Pyramid to Success

Normal growth and development proceed in an orderly, systematic, and predictable pattern, which provides a basis for identifying and assessing an individual's abilities. Understanding the normal path of growth and development across the life span assists the nurse in identifying appropriate and expected human behavior. The Pyramid to Success focuses on Sigmund Freud's theory of psychosexual development, Jean Piaget's theory of cognitive development, Erik Erikson's psychosocial theory, and Lawrence Kohlberg's theory of moral development. Growth and development concepts also focus on the aging process; and on physical characteristics, nutritional behaviors, skills, play, and specific safety measures relevant to a particular age group that will ensure a safe and hazard-free environment. When a question is presented on the NCLEX-RN® examination, if an age is identified in the question, note the age and think about the associated growth and developmental concepts to answer the question correctly.

Client Needs: Learning Objectives

Safe and Effective Care Environment

- Acting as a client advocate
- Communicating with the interprofessional health care team
- Ensuring home safety and security plans
- Ensuring that informed consent has been obtained for invasive treatments or procedures
- Establishing priorities of care
- Maintaining confidentiality

Preventing accidents and errors

Providing care in accordance with ethical and legal standards

Providing care using a nonjudgmental approach

Respecting client and family needs, based on their preferences

Implementing standard precautions and other transmission-based precautions as appropriate

Upholding the client's rights

Health Promotion and Maintenance

Discussing high-risk behaviors and lifestyle choices

Identifying changes that occur as a result of the aging process

Identifying developmental stages and transitions

Maintaining health and wellness and self-care measures

Monitoring growth and development

Performing the necessary health and physical assessment techniques

Providing client and family education

Respecting health care beliefs and preferences

Psychosocial Integrity

Assessing for abuse and neglect

Considering grief and loss issues and end-of-life care

Identifying coping mechanisms

Identifying cultural practices and beliefs of the client and appropriate support systems

Identifying loss of quantity and quality of relationships with the older client

Monitoring for adjustment to potential deterioration in physical and mental health and well-being in the older client

Monitoring for changes and adjustment in role function in the older client (threat to independent functioning)
Monitoring for sensory and perceptual alterations
Providing resources for the client and family

Physiological Integrity

Administering medication safely and teaching the client about prescribed medications

Identifying practices or restrictions related to procedures and treatments

Monitoring for alterations in body systems and the related risks associated with the client's age

Providing basic care and comfort needs

Providing interventions compatible with the client's age; cultural, spiritual, religious, and health care beliefs; education level; and language

Theories of Growth and Development

PRIORITY CONCEPT Development, Health Promotion

CRITICAL THINKING What Should You Do?

The mother of a 4-year-old child calls the clinic nurse and expresses concern because the child has been masturbating. Using Freud's psychosexual stages of development, what should the nurse do to alleviate the mother's concerns? Answer located on p. 261.

I. Psychosocial Development: Erik Erikson

A. The theory

1. Erikson's theory of psychosocial development describes the human life cycle as a series of 8 ego developmental stages from birth to death.
2. Each stage presents a psychosocial crisis, the goal of which is to integrate physical, maturation, and societal demands.
3. The result of 1 stage may not be permanent, but can be changed by experience(s) later in life.
4. The theory focuses on psychosocial tasks that are accomplished throughout the life cycle.

B. Psychosocial development: Occurs through a life-long series of crises affected by social and cultural factors

! According to Erikson's theory of psychosocial development, each psychosocial crisis must be resolved for the child or adult to progress emotionally. Unsuccessful resolution can leave the person emotionally disabled.

C. Stages of psychosocial development (Table 21-1)

D. Interventions to assist the client in achieving Erikson's stages of development (Box 21-1)

II. Cognitive Development: Jean Piaget

A. The theory

1. Piaget's theory of cognitive development defines cognitive acts as ways in which the mind organizes and adapts to its environment (i.e., "mental mapping").

2. Schema refers to an individual's cognitive structure or framework of thought.

3. Schemata

- a. Schemata are categories that an individual forms in his or her mind to organize and understand the world.
- b. A young child has only a few schemata with which to understand the world, and gradually these are increased.
- c. Adults use a wide variety of schemata to understand the world.

4. Assimilation

- a. Assimilation is the ability to incorporate new ideas, objects, and experiences into the framework of one's thoughts.
- b. The growing child will perceive and give meaning to new information according to what is already known and understood.

5. Accommodation

- a. Accommodation is the ability to change a schema to introduce new ideas, objects, or experiences.
- b. Accommodation changes the mental structure so that new experiences can be added.

B. Stages of cognitive development

1. Sensorimotor stage

- a. Birth to 2 years
- b. Development proceeds from reflex activity to imagining and solving problems through the senses and movement.
- c. The infant or toddler learns about reality and how it works.
- d. The infant or toddler does not recognize that objects continue to be in existence, even if out of the visual field.

2. Preoperational stage

- a. 2 to 7 years
- b. The child learns to think in terms of past, present, and future.
- c. The child moves from knowing the world through sensation and movement to prelogical thinking and finding solutions to problems.

TABLE 21-1 Erik Erikson's Stages of Psychosocial Development

Age	Psychosocial Crisis	Task	Resolution of Crisis	
			Successful	Unsuccessful
Infancy (birth to 18 mo)	Trust versus mistrust	Attachment to the mother	Trust in persons; faith and hope about the environment and future	General difficulties relating to persons effectively; suspicion; trust-fear conflict, fear of the future
Early childhood (18 mo to 3 yr)	Autonomy versus shame and doubt	Gaining some basic control over self and environment	Sense of self-control and adequacy; willpower	Independence-fear conflict; severe feelings of self-doubt
Late childhood (3-6 yr)	Initiative versus guilt	Becoming purposeful and directive	Ability to initiate one's own activities; sense of purpose	Aggression-fear conflict; sense of inadequacy or guilt
School age (6-12 yr)	Industry versus inferiority	Developing social, physical, and learning skills	Competence; ability to learn and work	Sense of inferiority; difficulty learning and working
Adolescence (12-20 yr)	Identity versus role confusion	Developing sense of identity	Sense of personal identity	Confusion about who one is; identity submerged in relationships or group memberships
Early adulthood (20-35 yr)	Intimacy versus isolation	Establishing intimate bonds of love and friendship	Ability to love deeply and commit oneself	Emotional isolation, egocentricity
Middle adulthood (35-65 yr)	Generativity versus stagnation	Fulfilling life goals that involve family, career, and society	Ability to give and care for others	Self-absorption; inability to grow as a person
Later adulthood (65 yr to death)	Integrity versus despair	Looking back over one's life and accepting its meaning	Sense of integrity and fulfillment	Dissatisfaction with life

Modified from Varcarolis E: Foundations of psychiatric mental health nursing, ed 6, St. Louis, 2010, Saunders.

BOX 21-1 Interventions to Assist the Client in Achieving Erikson's Stages of Development

Infancy

Hold the infant often
Offer comfort after painful procedures
Meet the infant's needs for food and hygiene
Encourage parents to room in while hospitalized

Early Childhood

Allow self-feeding opportunities
Encourage child to remove and put on own clothes
Allow for choice

Late Childhood

Offer medical equipment for play
Accept the child's choices and expressions of feelings

School Age

Encourage the child to continue schoolwork while hospitalized
Encourage the child to bring favorite pastimes to the hospital

Adolescence

Take the health history and perform examinations without parents present
Introduce the adolescent to other teens with the same health condition

Early Adulthood

Include support from client's partner or significant other
Assist with rehabilitation and contacting support services as needed before returning to work

Middle Adulthood

Assist in choosing creative ways to foster social development
Encourage volunteer activities

Later Adulthood

Listen attentively to reminiscent stories about his or her life's accomplishments
Assist with making changes to living arrangements

- d. The child is egocentric.
 - e. The child is unable to conceptualize and requires concrete examples.
3. Concrete operational
 - a. 7 to 11 years
 - b. The child is able to classify, order, and sort facts.
 - c. The child moves from prelogical thought to solving concrete problems through logic.
 - d. The child begins to develop abstract thinking.
 4. Formal operations
 - a. 11 years to adulthood
 - b. The person is able to think abstractly and logically.
 - c. Logical thinking is expanded to include solving abstract and concrete problems.

III. Moral Development: Lawrence Kohlberg

A. Moral development

1. Moral development is a complicated process involving the acceptance of the values and rules of society in a way that shapes behavior.
2. Moral development is classified in a series of levels and behaviors.
3. Moral development is sequential but people do not automatically go from 1 stage or level to the next as they mature.
4. Stages or levels of moral development cannot be skipped.

B. Levels of moral development (Box 21-2)

IV. Psychosexual Development: Sigmund Freud

A. Components of the theory (Box 21-3)

B. Levels of awareness

1. Unconscious level of awareness
 - a. The unconscious is not logical and is governed by the Pleasure Principle, which refers to seeking immediate tension reduction.
 - b. Memories, feelings, thoughts, or wishes are repressed and are not available to the conscious mind.
 - c. These repressed memories, thoughts, or feelings, if made prematurely conscious, can cause anxiety.
2. Preconscious level of awareness
 - a. The preconscious is called the subconscious.
 - b. The preconscious includes experiences, thoughts, feelings, or desires that might not be in immediate awareness but can be recalled to consciousness.
 - c. The subconscious can help to repress unpleasant thoughts or feelings and can examine and censor certain wishes and thinking.
3. Conscious level of awareness
 - a. The conscious mind is logical and is regulated by the Reality Principle.

- b. Consciousness includes all experiences that are within an individual's awareness and that the individual is able to control, and includes all information that is remembered easily and is immediately available to an individual.

C. Agencies of the mind: Id, ego, and superego

 The id, ego, and superego are the 3 systems of personality. These psychological processes follow different operating principles. In a mature and well-adjusted personality, they work together as a team under the leadership of the ego.

1. The id

- a. Source of all drives, present at birth, operates according to the Pleasure Principle
- b. Does not tolerate uncomfortable states and seeks to discharge the tension and return to a more comfortable, constant level of energy
- c. Acts immediately in an impulsive, irrational way and pays no attention to the consequences of its actions; therefore, often behaves in ways harmful to self and others
- d. The primary process is a psychological activity in which the id attempts to reduce tension.
- e. The primary process by itself is not capable of reducing tension; therefore, a secondary psychological process must develop if the individual is to survive. When this occurs, the structure of the second system of the personality, the ego, begins to take form.

2. The ego

- a. Functions include reality testing and problem solving; follows the Reality Principle
- b. Begins its development during the fourth or fifth month of life
- c. Emerges out of the id and acts as an intermediary between the id and the external world
- d. Emerges because the needs, wishes, and demands of the id require appropriate exchanges with the outside world of reality
- e. The ego distinguishes between things in the mind and things in the external world.

3. The superego

- a. Necessary part of socialization that develops during the phallic stage at 3 to 6 years of age
- b. Develops from interactions with the child's parents during the extended period of childhood dependency
- c. Includes internalization of the values, ideals, and moral standards of parents and society
- d. Superego consists of the conscience and the ego ideal.
- e. Conscience refers to capacity for self-evaluation and criticism; when moral codes are violated, the conscience punishes the individual by instilling guilt.

BOX 21-2 Moral Development: Lawrence Kohlberg**Level One: Preconventional Morality****Stage 0 (Birth to 2 Years): Egocentric Judgment**

The infant has no awareness of right or wrong.

Stage 1 (2 to 4 Years): Punishment-Obedience Orientation

At this stage, children cannot reason as mature members of society. Children view the world in a selfish way, with no real understanding of right or wrong.

The child obeys rules and demonstrates acceptable behavior to avoid punishment and to avoid displeasing those who are in power, and because the child fears punishment from a superior force, such as a parent.

A toddler typically is at the first substage of the preconventional stage, involving punishment and obedience orientation, in which the toddler makes judgments based on avoiding punishment or obtaining a reward.

Physical punishment and withholding privileges tend to give the toddler a negative view of morals.

Withdrawing love and affection as punishment leads to feelings of guilt in the toddler.

Appropriate discipline includes providing simple explanations of why certain behaviors are unacceptable, praising appropriate behavior, and using distractions when the toddler is headed for an unsafe action.

Stage 2 (4 to 7 Years): Instrumental Relativist Orientation

The child conforms to rules to obtain rewards or have favors returned.

The child's moral standards are those of others, and the child observes them either to avoid punishment or obtain rewards.

A preschooler is in the preconventional stage of moral development.

In this stage, conscience emerges and the emphasis is on external control.

Level Two: Conventional Morality

The child conforms to rules to please others.

The child has increased awareness of others' feelings.

A concern for social order begins to emerge.

A child views good behavior as that which those in authority will approve.

If the behavior is not acceptable, the child feels guilty.

Stage 3 (7 to 10 Years): Good Boy or Nice Girl Orientation

Conformity occurs to avoid disapproval or dislike by others.

This stage involves living up to what is expected by individuals close to the child or what individuals generally expect of others in their roles such as daughter, son, brother, sister, and friend.

Being good is important and is interpreted as having good motives and showing concern about others.

Being good also means maintaining mutual relationships, such as trust, loyalty, respect, and gratitude.

Stage 4 (10 to 12 Years): Law and Order Orientation

The child has more concern with society as a whole.

Emphasis is on obeying laws to maintain social order.

Moral reasoning develops as the child shifts the focus of living to society.

The school-age child is at the conventional level of the conformity stage and has an increased desire to please others.

The child observes and to some extent internalizes the standards of others.

The child wants to be considered "good" by those individuals whose opinions matter to her or him.

Level Three: Postconventional Morality

The individual focuses on individual rights and principles of conscience.

The focus is on concerns regarding what is best for all.

Stage 5: Social Contract and Legalistic Orientation

The person is aware that others hold a variety of values and opinions and that most values and rules are relative to the group.

The adolescent in this stage gives and takes and does not expect to get something without paying for it.

Stage 6: Universal Ethical Principles Orientation

Conformity is based on universal principles of justice and occurs to avoid self-condemnation.

This stage involves following self-chosen ethical principles.

The development of the postconventional level of morality occurs in the adolescent at about age 13 years, marked by the development of an individual conscience and a defined set of moral values.

The adolescent can now acknowledge a conflict between 2 socially accepted standards and try to decide between them.

Control of conduct is now internal in standards observed and in reasoning about right and wrong.

BOX 21-3 Components of Sigmund Freud's Psychosexual Development Theory

- Levels of awareness
- Agencies of the mind (id, ego, superego)
- Concept of anxiety and defense mechanisms
- Psychosexual stages of development

D. Anxiety and defense mechanisms

1. The ego develops defenses or defense mechanisms to fight off anxiety.
2. Defense mechanisms operate on an unconscious level, except for suppression, so the individual is not aware of their operation.
3. Defense mechanisms deny, falsify, or distort reality to make it less threatening.

BOX 21-4 Freud's Psychosexual Stages of Development**Oral Stage (Birth to 1 Year)**

During this stage, the infant is concerned with self-gratification. The infant is all id, operating on the Pleasure Principle and striving for immediate gratification of needs.

When the infant experiences gratification of basic needs, a sense of trust and security begins.

The ego begins to emerge as the infant begins to see self as separate from the mother; this marks the beginning of the development of a sense of self.

Anal Stage (1 to 3 Years)

Toilet training occurs during this period, and the child gains pleasure from the elimination of the feces and from their retention.

The conflict of this stage is between those demands from society and the parents and the sensations of pleasure associated with the anus.

The child begins to gain a sense of control over instinctive drives and learns to delay immediate gratification to gain a future goal.

Phallic Stage (3 to 6 Years)

The child experiences pleasurable and conflicting feelings associated with the genital organs.

The pleasures of masturbation and the fantasy life of children set the stage for the Oedipus complex.

The child's unconscious sexual attraction to and wish to possess the parent of the opposite sex, the hostility and desire to remove the parent of the same sex, and the subsequent guilt about these wishes is the conflict the child faces.

The conflict is resolved when the child identifies with the parent of the same sex.

The emergence of the superego is the solution to and the result of these intense impulses.

Latency Stage (6 to 12 Years)

The latency stage is a tapering off of conscious biological and sexual urges.

The sexual impulses are channeled and elevated into a more culturally accepted level of activity.

Growth of ego functions and the ability to care about and relate to others outside the home is the task of this stage of development.

Genital Stage (12 Years and Beyond)

The genital stage emerges at adolescence with the onset of puberty, when the genital organs mature.

The individual gains gratification from his or her own body.

During this stage, the individual develops satisfying sexual and emotional relationships with members of the opposite sex.

The individual plans life goals and gains a strong sense of personal identity.

4. An individual cannot survive without defense mechanisms; however, if the individual becomes too extreme in distorting reality, interference with healthy adjustment and personal growth may occur.

- E. Psychosexual stages of development (Box 21-4)
1. Human development proceeds through a series of stages from infancy to adulthood.
 2. Each stage is characterized by the inborn tendency of all individuals to reduce tension and seek pleasure.
 3. Each stage is associated with a particular conflict that must be resolved before the child can move successfully to the next stage.
 4. Experiences during the early stages determine an individual's adjustment patterns and the personality traits that the individual has as an adult.

CRITICAL THINKING What Should You Do?

Answer: According to Freud's psychosexual stages of development, between the ages of 3 and 6 the child is in the phallic stage. At this time, the child devotes much energy to examining genitalia, masturbating, and expressing interest in sexual concerns. Therefore, the nurse should alleviate the mother's concern by telling the mother that this behavior is normal.

Reference: Hockenberry, Wilson (2015), pp. 525, 570–571.

PRACTICE QUESTIONS

203. The clinic nurse is preparing to explain the concepts of Kohlberg's theory of moral development with a parent. The nurse should tell the parent that which factor motivates good and bad actions for the child at the pre-conventional level?
1. Peer pressure
 2. Social pressure
 3. Parents' behavior
 4. Punishment and reward
204. The maternity nurse is providing instructions to a new mother regarding the psychosocial development of the newborn infant. Using Erikson's psychosocial development theory, the nurse instructs the mother to take which measure?
1. Allow the newborn infant to signal a need.
 2. Anticipate all needs of the newborn infant.
 3. Attend to the newborn infant immediately when crying.
 4. Avoid the newborn infant during the first 10 minutes of crying.
205. The nurse notes that a 6-year-old child does not recognize that objects exist even when the objects are outside of the visual field. Based on this observation, which action should the nurse take?

1. Report the observation to the health care provider.
 2. Move the objects in the child's direct field of vision.
 3. Teach the child how to visually scan the environment.
 4. Provide additional lighting for the child during play activities.
206. A nursing student is presenting a clinical conference to peers regarding Freud's psychosexual stages of development, specifically the anal stage. The student explains to the group that which characteristic relates to this stage of development?
1. This stage is associated with toilet training.
 2. This stage is characterized by the gratification of self.
 3. This stage is characterized by a tapering off of conscious biological and sexual urges.
 4. This stage is associated with pleasurable and conflicting feelings about the genital organs.
207. The nurse is describing Piaget's cognitive developmental theory to pediatric nursing staff. The nurse should tell that staff that which child behavior is characteristic of the formal operations stage?
1. The child has the ability to think abstractly.
 2. The child begins to understand the environment.
 3. The child is able to classify, order, and sort facts.
 4. The child learns to think in terms of past, present, and future.
208. The mother of an 8-year-old child tells the clinic nurse that she is concerned about the child because the child seems to be more attentive to friends than anything else. Using Erikson's psychosocial development theory, the nurse should make which response?
1. "You need to be concerned."
 2. "You need to monitor the child's behavior closely."
 3. "At this age, the child is developing his own personality."
 4. "You need to provide more praise to the child to stop this behavior."
- ❖ 209. The nurse educator is preparing to conduct a teaching session for the nursing staff regarding the theories of growth and development and plans to discuss Kohlberg's theory of moral development. What information should the nurse include in the session? Select all that apply.
- 1. Individuals move through all 6 stages in a sequential fashion.
 - 2. Moral development progresses in relationship to cognitive development.
 - 3. A person's ability to make moral judgments develops over a period of time.
 - 4. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior.
 - 5. In stage 1 (punishment-obedience orientation), children are expected to reason as mature members of society.
 - 6. In stage 2 (instrumental-relativist orientation), the child conforms to rules to obtain rewards or have favors returned.
- ❖ 210. A parent of a 3-year-old tells a clinic nurse that the child is rebelling constantly and having temper tantrums. Using Erikson's psychosocial development theory, which instructions should the nurse provide to the parent? Select all that apply.
- 1. Set limits on the child's behavior.
 - 2. Ignore the child when this behavior occurs.
 - 3. Allow the behavior, because this is normal at this age period.
 - 4. Provide a simple explanation of why the behavior is unacceptable.
 - 5. Punish the child every time the child says "no" to change the behavior.

ANSWERS

203. 4

Rationale: In the preconventional stage, morals are thought to be motivated by punishment and reward. If the child is obedient and is not punished, then the child is being moral. The child sees actions as good or bad. If the child's actions are good, the child is praised. If the child's actions are bad, the child is punished. Options 1, 2, and 3 are not associated factors for this stage of moral development.

Test-Taking Strategy: Eliminate options 1 and 2; they are **comparable or alike** because peer pressure is the same as social pressure. To select from the remaining options, recalling that

the preconventional stage occurs between birth and 7 years will assist in directing you to the correct option.

Review: **Kohlberg's theory of moral development**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Client Education; Development

Reference: Hockenberry, Wilson (2015), p. 575.

204. 1

Rationale: According to Erikson, the caregiver should not try to anticipate the newborn infant's needs at all times but must

allow the newborn infant to signal needs. If a newborn infant is not allowed to signal a need, the newborn will not learn how to control the environment. Erikson believed that a delayed or prolonged response to a newborn infant's signal would inhibit the development of trust and lead to mistrust of others.

Test-Taking Strategy: Eliminate options 2, 3, and 4 because of the **closed-ended words**, all, immediately, and avoid, in these options.

Review: **Erikson's stage of psychosocial development**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Client Education; Development

Reference: Hockenberry, Wilson (2015), p. 420.

205. 1

Rationale: According to Jean Piaget's theory of cognitive development, it is normal for the infant or toddler not to recognize that objects continue to be in existence, even if out of the visual field; however, this is abnormal for the 6-year-old. If a 6-year-old child does not recognize that objects still exist even when outside the visual field, the child is not progressing normally through the developmental stages. The nurse should report this finding to the health care provider. Options 2, 3, and 4 delay necessary follow-up and treatment.

Test-Taking Strategy: Focus on the **data in the question**. Also, note the age of the child and think about developmental concepts related to this age. Noting that the child is not able to recognize that objects continue to be in existence, even if out of the visual field, will direct you to the correct option. Also, note that options 2, 3, and 4 are **comparable or alike** and are interventions that will delay follow-up for an abnormal observation.

Review: **Jean Piaget's theory of cognitive development**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Clinical Judgment; Development

Reference: Hockenberry, Wilson (2015), pp. 525–526, 573.

206. 1

Rationale: In general, toilet training occurs during the anal stage. According to Freud, the child gains pleasure from the elimination of feces and from their retention. Option 2 relates to the oral stage. Option 3 relates to the latency period. Option 4 relates to the phallic stage.

Test-Taking Strategy: Focus on the **subject**, the anal stage. Note the relationship between the words anal in the question and toilet training in the correct option.

Review: **Freud's psychosocial stages of development**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Development Stages—Infancy to Adolescence

Priority Concepts: Development; Health Promotion

Reference: McKinney et al. (2013), p. 74.

207. 1

Rationale: In the formal operations stage, the child has the ability to think abstractly and logically. Option 2 identifies the sensorimotor stage. Option 3 identifies the concrete operational stage. Option 4 identifies the preoperational stage.

Test-Taking Strategy: Focus on the **subject**, the formal operations stage of Piaget's cognitive developmental theory, and note the relationship between the **subject** and the description in the correct option. Remember that in the formal operations stage, the child has the ability to think abstractly and logically.

Review: **Piaget's cognitive developmental theory**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Client Education; Development

Reference: Hockenberry, Wilson (2015), pp. 525–526.

208. 3

Rationale: According to Erikson, during school-age years (6 to 12 years of age), the child begins to move toward peers and friends and away from the parents for support. The child also begins to develop special interests that reflect his or her own developing personality instead of the parents. Therefore options 1, 2, and 4 are incorrect responses.

Test-Taking Strategy: Use knowledge of Erikson's psychosocial development theory related to middle childhood. Options 1 and 2 can be eliminated first because they are **comparable or alike** and indicate that the mother should be concerned about the child. Eliminate option 4 next because although praising the child for accomplishments is important at this age, the behavior that the child is exhibiting is normal.

Review: **Erik Erikson's stages of psychosocial development**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Implementation

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Health Promotion

Reference: Hockenberry, Wilson (2015), p. 571.

❖ 209. 2, 3, 4, 6

Rationale: Kohlberg's theory states that individuals move through stages of development in a sequential fashion but that not everyone reaches stages 5 and 6 in his or her development of personal morality. The theory provides a framework for understanding how individuals determine a moral code to guide their behavior. It states that moral development progresses in relationship to cognitive development and that a person's ability to make moral judgments develops over a period of time. In stage 1, ages 2 to 3 years (punishment-obedience orientation), children cannot reason as mature members of society. In stage 2, ages 4 to 7 years (instrumental-relativist orientation), the child conforms to rules to obtain rewards or have favors returned.

Test-Taking Strategy: Read each option carefully. Recalling that the theory provides a framework for understanding how individuals determine a moral code to guide their behavior and recalling the ages associated with each stage will assist in

answering the question. Also noting the **closed-ended word** all in option 1 and the word mature in option 5 will assist in eliminating these options.

Review: **Kohlberg's theory of moral development**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Client Education; Development

Reference: Hockenberry, Wilson (2015), pp. 526, 575.

❖ 210. 1, 4

Rationale: According to Erikson, the child focuses on gaining some basic control over self and the environment and independence between ages 1 and 3 years. Gaining independence often means that the child has to rebel against the parents' wishes. Saying things like "no" or "mine" and having temper tantrums are common during this period of development. Being consistent

and setting limits on the child's behavior are necessary elements. Providing a simple explanation of why certain behaviors are unacceptable is an appropriate action. Options 2 and 3 do not address the child's behavior. Option 5 is likely to produce a negative response during this normal developmental pattern. Test-Taking Strategy: Options 2 and 3 can be eliminated first because they are **comparable or alike**, indicating that the mother should not address the child's behavior. Next, eliminate option 5 because this action is likely to produce a negative response during this normal developmental pattern. Also, note the **closed-ended word** every in option 5.

Review: **Erik Erikson's stages of psychosocial development**

Developmental Stages

PRIORITY CONCEPTS Development, Family Dynamics

CRITICAL THINKING What Should You Do?

The nurse is caring for a hospitalized preschool-age child who is very apprehensive. What should the nurse do to assist in promoting comfort in the child?

Answer located on p. 276.

I. The Hospitalized Infant and Toddler

A. Separation anxiety

1. Protest
 - a. Crying, screaming, searching for a parent; avoidance and rejection of contact with strangers
 - b. Verbal attacks on others
 - c. Physical fighting: Kicking, biting, hitting, pinching
2. Despair
 - a. Withdrawn, depressed, uninterested in the environment
 - b. Loss of newly learned skills
3. Detachment
 - a. Detachment is uncommon and occurs only after lengthy separations from the parent.
 - b. Superficially, the toddler appears to have adjusted to the loss.
 - c. During the detachment phase, the toddler again becomes more interested in the environment, plays with others, and seems to form new relationships; this behavior is a form of resignation and is not a sign of contentment.
 - d. The toddler detaches from the parent in an effort to escape the emotional pain of desiring the parent's presence.
 - e. During the detachment phase, the toddler copes by forming shallow relationships with others, becoming increasingly self-centered,

and attaching primary importance to material objects.

- f. Detachment is the most serious phase because reversal of the potential adverse effects is less likely to occur once detachment is established.
 - g. In most situations, the temporary separation imposed by hospitalization does not cause such prolonged parental absence that the toddler enters into detachment.
- #### B. Fear of injury and pain: Affected by previous experiences, separation from parents, and preparation for the experience
- #### C. Loss of control
1. Hospitalization, with its own set of rituals and routines, can severely disrupt the life of a toddler.
 2. The lack of control often is exhibited in behaviors related to feeding, toileting, playing, and bedtime.
 3. The toddler may demonstrate regression.
- #### D. Interventions
1. Provide cuddling and touch and talk softly to the infant.
 2. Provide opportunities for sucking and oral stimulation for the infant, using a pacifier if the infant is NPO (not to receive anything by mouth).
 3. Provide stimulation, if appropriate, for the infant, using objects of contrasting colors and textures.
 4. Provide choices as much as possible to the toddler to enable him or her to have some control.
 5. Approach the toddler with a positive attitude.
 6. Allow the toddler to express feelings of protest.
 7. Encourage the toddler to talk about parents or others in their lives.
 8. Accept regressive behavior without ridiculing the toddler.
 9. Provide the toddler with favorite and comforting objects.
 10. Allow the toddler as much mobility as possible.

11. Anticipate temper tantrums from the toddler, and maintain a safe environment for physical acting out.
12. Employ pain reduction techniques, as appropriate.

 For the hospitalized toddler, provide routines and rituals as close as possible to what he or she is used to at home.

II. The Hospitalized Preschooler

A. Separation anxiety

1. Separation anxiety is generally less obvious and less serious than in the toddler.
2. As stress increases, the preschooler's ability to separate from the parents decreases.
3. Protest
 - a. Protest is less direct and aggressive than in the toddler.
 - b. The preschooler may displace feelings onto others.
4. Despair
 - a. The preschooler reacts in a manner similar to that of the toddler.
 - b. The preschooler is quietly withdrawn, depressed, and uninterested in the environment.
 - c. The child exhibits loss of newly learned skills.
 - d. The preschooler becomes generally uncooperative, refusing to eat or take medication.
 - e. The preschooler repeatedly asks when the parents will be visiting.
5. Detachment: Similar to the toddler

B. Fear of injury and pain

1. The preschooler has a general lack of understanding of body integrity.
2. The child fears invasive procedures and mutilation.
3. The child imagines things to be much worse than they are.
4. Preschoolers believe that they are ill because of something they did or thought.

C. Loss of control

1. The preschooler likes familiar routines and rituals and may show regression if not allowed to maintain some control.
2. Preschoolers' egocentric and magical thinking limits their ability to understand events because they view all experiences from their own self-referenced (egocentric) perspective.
3. The child has attained a good deal of independence and self-care at home and may expect that to continue in the hospital.

D. Interventions

1. Provide a safe and secure environment.
2. Take time for communication.
3. Allow the preschooler to express anger.

4. Acknowledge fears and anxieties.
5. Accept regressive behavior; assist the preschooler in moving from regressive to appropriate behaviors according to age.
6. Encourage rooming-in or leaving a favorite toy.
7. Allow mobility and provide play and diversional activities.
8. Place the preschooler with other children of the same age if possible.
9. Encourage the preschooler to be independent.
10. Explain procedures simply, on the preschooler's level.
11. Avoid intrusive procedures when possible.
12. Allow the wearing of underpants.

III. The Hospitalized School-Age Child

A. Separation anxiety

1. The school-age child is accustomed to periods of separation from the parents, but as stressors are added, the separation becomes more difficult.
2. The child is more concerned with missing school and the fear that friends will forget her or him.
3. Usually, the stages of behavior of protest, despair, and detachment do not occur with school-age children.

B. Fear of injury and pain

1. The school-age child fears bodily injury and pain.
2. The child fears illness itself, disability, death, and intrusive procedures in genital areas.
3. The child is uncomfortable with any type of sexual examination.
4. The child groans or whines, holds rigidly still, and communicates about pain.

C. Loss of control

1. The child is usually highly social, independent, and involved with activities.
2. The child seeks information and asks relevant questions about tests and procedures and the illness.
3. The child associates his or her actions with the cause of the illness.
4. The child may feel helpless and dependent if physical limitations occur.

D. Interventions

1. Encourage rooming-in.
2. Focus on the school-age child's abilities and needs.
3. Encourage the school-age child to become involved with his or her own care.
4. Accept regression but encourage independence.
5. Provide choices to the school-age child.
6. Allow expression of feelings verbally and nonverbally.
7. Acknowledge fears and concerns and allow for discussion.
8. Explain all procedures, using body diagrams or outlines.

9. Provide privacy.
10. Avoid intrusive procedures if possible.
11. Allow the school-age child to wear underpants.
12. Involve the school-age child in activities appropriate to the developmental level and illness.
13. Encourage the school-age child to contact friends.
14. Provide for educational needs.
15. Use appropriate interventions to relieve pain.

IV. The Hospitalized Adolescent

A. Separation anxiety

1. Adolescents are not sure whether they want their parents with them when they are hospitalized.
2. Adolescents become upset if friends go on with their lives, excluding them.

 For the hospitalized adolescent, separation from friends is a source of anxiety.

B. Fear of injury and pain

1. Adolescents fear being different from others and their peers.
2. Adolescents may give the impression that they are not afraid, even though they are terrified.
3. Adolescents become guarded when any areas related to sexual development are examined.

C. Loss of control

1. Behaviors exhibited include anger, withdrawal, and uncooperativeness.
2. Adolescents seek help and then reject it.

D. Interventions

1. Encourage questions about appearance and effects of the illness on the future.
2. Explore feelings about the hospital and the significance that the illness might have for relationships.
3. Encourage adolescents to wear their own clothes and carry out normal grooming activities.
4. Allow favorite foods to be brought into the hospital if possible.
5. Provide privacy.
6. Use body diagrams to prepare for procedures.
7. Introduce them to other adolescents in the nursing unit.
8. Encourage maintaining contact with peer groups.
9. Provide for educational needs.
10. Identify formation of future plans.
11. Help to develop positive coping mechanisms.

V. Communication Approaches

A. General guidelines (Box 22-1)

B. Infant

1. Infants respond to nonverbal communication behaviors of adults, such as holding, rocking, patting, cuddling, and touching.

BOX22-1 General Guidelines for Communication

Allow the child to feel comfortable with the nurse.
 Communicate through the use of objects.
 Allow the child to express fears and concerns.
 Speak clearly and in a quiet, unhurried voice.
 Offer choices when possible.
 Be honest with the child.
 Set limits with the child as appropriate.

2. Use a slow approach and allow the infant to get to know the nurse.
3. Use a calm, soft, soothing voice.
4. Be responsive to cries.
5. Talk and read to infants.
6. Allow security objects such as blankets and pacifiers if the infant has them.

C. Toddler

1. Approach the toddler cautiously.
2. Remember that toddlers accept the verbal communications of others literally.
3. Learn the toddler's words for common items and use them in conversations.
4. Use short, concrete terms.
5. Prepare the toddler for procedures immediately before the event.
6. Repeat explanations and descriptions.
7. Use **play** for demonstrations.
8. Use visual aids such as picture books, puppets, and dolls.
9. Allow the toddler to handle the equipment or instruments; explain what the equipment or instrument does and how it feels.
10. Encourage the use of comfort objects.

D. Preschooler

1. Seek opportunities to offer choices.
2. Speak in simple sentences.
3. Be concise and limit the length of explanations.
4. Allow asking questions.
5. Describe procedures as they are about to be performed.
6. Use play to explain procedures and activities.
7. Allow handling of equipment or instruments, which will ease fear and help to answer questions.

E. School-age child

1. Establish limits.
2. Provide reassurance to help in alleviating fears and anxieties.
3. Engage in conversations that encourage thinking.
4. Use medical play techniques.
5. Use photographs, books, dolls, and videos to explain procedures.
6. Explain in clear terms.
7. Allow time for composure and privacy.

F. Adolescent

1. Remember that the adolescent may be preoccupied with body image.
2. Encourage and support independence.
3. Provide privacy.
4. Use photographs, books, and videos to explain procedures.
5. Engage in conversations about the adolescent's interests.
6. Avoid becoming too abstract, too detailed, and too technical.
7. Avoid responding by prying, confronting, condescending, or expressing judgmental attitudes.

VI. Car Safety Seats and Guidelines

- A. The safest place for all children to ride, regardless of age, is in the back seat of the car.
- B. Lock the car doors; 4-door cars should be equipped with child safety locks on the back doors.
- C. There are different types of car safety seats and the manufacturer's guidelines need to be followed.
- D. For specific information regarding car safety, refer to Car seats: information for families for 2016 (copyright © 2016 American Academy of Pediatrics), found at www.healthychildren.org/English/safety-prevention/on-the-go/Pages/Car-Safety-Seats-Information-for-Families.aspx.

VII. Developmental Characteristics

A. Infant

1. Physical
 - a. Height increases by 1 inch per month in the first 6 months, and by 1 year the length has increased by 50%.
 - b. Weight is doubled at 5 to 6 months and tripled at 12 months.
 - c. At birth, head circumference is 33 to 35 cm (13.2 to 14 inches), approximately 2 to 3 cm more than chest circumference.
 - d. By 1 to 2 years of age, head circumference and chest circumference are equal.
 - e. Anterior fontanel (soft and flat in a normal infant) closes by 12 to 18 months of age.
 - f. Posterior fontanel (soft and flat in a normal infant) closes by the end of the second month.
 - g. The first primary teeth to erupt are the lower central incisors at approximately 6 to 10 months of age.
 - h. Sleep patterns vary among infants; in general, by 3 to 4 months of age, most infants have developed a nocturnal pattern of sleep that lasts 9 to 11 hours.
2. Vital signs (Box 22-2)
3. Nutrition
 - a. The infant may breast-feed or bottle-feed (with iron-fortified formula), depending on the mother's choice; however, breast milk is

BOX 22-2 Vital Signs: Newborn and 1-Year-Old Infant

Newborn

Temperature: Axillary, 96.8°F to 99.0°F (36°C to 37.2°C)
 Apical Heart Rate: 120 to 160 beats/minute
 Respirations: 30 to 60 (average 40) breaths/minute
 Blood Pressure: 80-90/40-50 mm Hg

1-Year-Old Infant

Temperature: Axillary, 97°F to 99°F (36.1°C to 37.2°C)
 Apical Heart Rate: 90 to 130 beats/minute
 Respirations: 20 to 40 breaths/minute
 Blood Pressure: 90/56 mm Hg

the preferred form of nutrition for all infants, especially during the first 6 months.

- b. Exclusively breast-fed infants and infants ingesting less than 1000 mL of vitamin D–fortified formula or milk per day should receive daily vitamin D supplementation (400 IU) starting in the first few days of life to prevent rickets and vitamin D deficiency.
- c. Iron stores from birth are depleted by 4 months of age; if the infant is being breast-fed only, iron supplementation, usually with iron-fortified cereal, is needed.
- d. Whole milk, low-fat milk, skim milk, other animal milk, or imitation milk should not be given to infants as a primary source of nutrition because these food sources lack the necessary components needed for growth and have limited digestibility.
- e. Fluoride supplementation may be needed at about 6 months of age, depending on the infant's intake of fluoridated tap water.
- f. Solid foods (strained, pureed, or finely mashed) are introduced at about 5 to 6 months of age; introduce solid foods one at a time, usually at intervals of 4 to 5 days, to identify food allergens.
- g. Sequence of the introduction of solid foods varies depending on health care provider's preference and usually is as follows: iron-fortified rice cereal, fruits, vegetables, then meats.
- h. At 12 months of age, eggs can be given (introduce egg whites in small quantities to detect an allergy); cheese may be used as a substitute for meat.
- i. Avoid solid foods that place the infant at risk for choking, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.
- j. Avoid microwaving baby bottles and baby food because of the potential for uneven heating.
- k. Never mix food or medications with formula.
- l. Avoid adding honey to formula, water, or other fluid to prevent botulism.

- m. Offer fruit juice from a cup (12 to 13 months or at a prescribed age) rather than a bottle to prevent nursing (bottle-mouth) caries; fruit juice is limited because of its high sugar content.

4. Skills (Box 22-3)

5. Play

- a. Solitary
- b. Birth to 3 months: Verbal, visual, and tactile stimuli

- c. 4 to 6 months: Initiation of actions and recognition of new experiences
- d. 6 to 12 months: Awareness of self, imitation, repetition of pleasurable actions
- e. Enjoyment of soft stuffed animals, crib mobiles with contrasting colors, squeeze toys, rattles, musical toys, water toys during the bath, large picture books, and push toys after the infant begins to walk

6. Safety

- a. Parents must baby-proof the home.
- b. Guard the infant when on a bed or changing table.
- c. Use gates to protect the infant from stairs.
- d. Be sure that bath water is not hot; do not leave the infant unattended in the bath.
- e. Do not hold the infant while drinking or working near hot liquids or items such as a stove.
- f. Cool vaporizers instead of steam should be used if needed, to prevent burn injuries.
- g. Avoid offering food that is round and similar to the size of the airway to prevent choking.
- h. Be sure that toys have no small pieces.
- i. Toys or mobiles hanging over the crib should be well out of reach, to prevent strangulation.
- j. Avoid placing large toys in the crib because an older infant may use them as steps to climb.
- k. Cribs should be positioned away from curtains and blind cords.
- l. Cover electrical outlets.
- m. Remove hazardous objects from low, reachable places.
- n. Remove chemicals such as cleaning or other household products, medications, poisons, and plants from the infant's reach.
- o. Keep the Poison Control Center number available.

 **Never shake an infant because of the risk of causing a closed head injury known as shaken baby syndrome, which is a life-threatening injury.**

B. Toddler

1. Physical

- a. Height and weight increase in phases, reflecting growth spurts and lags.
- b. Head circumference increases about 1 inch (25.5 mm) between ages 1 and 2; thereafter head circumference increases about ½ inch (12.5 mm) per year until age 5.
- c. Anterior fontanel closes between ages 12 and 18 months.
- d. Weight gain is slower than in infancy; by age 2, the average weight is 22 to 27 pounds (10 to 12 kg).
- e. Normal height changes include a growth of about 3 inches (7.5 cm) per year; the average

BOX 22-3 Infant Skills

2 to 3 Months

- Smiles
- Turns head side to side
- Cries
- Follows objects
- Holds head in midline

4 to 5 Months

- Grasps objects
- Switches objects from hands
- Rolls over for the first time
- Enjoys social interaction
- Begins to show memory
- Aware of unfamiliar surroundings

6 to 7 Months

- Creeps
- Sits with support
- Imitates
- Exhibits fear of strangers
- Holds arms out
- Frequent mood swings
- Waves “bye-bye”

8 to 9 Months

- Sits steadily unsupported
- Crawls
- May stand while holding on
- Begins to stand without help

10 to 11 Months

- Can change from prone to sitting position
- Walks while holding on to furniture
- Stands securely
- Entertains self for periods of time

12 to 13 Months

- Walks with 1 hand held
- Can take a few steps without falling
- Can drink from a cup

14 to 15 Months

- Walks alone
- Can crawl up stairs
- Shows emotions such as anger and affection
- Will explore away from mother in familiar surroundings

height of the toddler is 34 inches (86 cm) at age 2 years.

- f. Lordosis (pot belly) is noted.
 - g. The toddler should see a dentist soon after the first teeth erupt, usually around 1 year of age, and oral hygiene measures should be instituted; regular dental care is essential, and the toddler will require assistance with brushing and flossing of teeth (fluoride supplements may be necessary if the water is not fluoridated).
 - h. A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries.
 - i. Typically, the toddler sleeps through the night and has 1 daytime nap; the daytime nap is normally discontinued at about age 3.
 - j. A consistent bedtime ritual helps to prepare the toddler for sleep.
 - k. Security objects at bedtime may assist in sleep.
2. Vital signs (Box 22-4)
 3. Nutrition
 - a. The MyPlate food guide (see Fig. 11-1) provides dietary guidelines and applies to children as young as 2 years of age (see www.choosemyplate.gov).
 - b. The toddler should average an intake of 2 to 3 servings of milk daily (24 to 30 oz [700 to 800 mL]) to ensure an adequate amount of calcium and phosphorus (low-fat milk may be given after 2 years of age).
 - c. Trans-fatty acids and saturated fats need to be restricted; otherwise fat restriction is not appropriate for a toddler (mothers should be taught about the types of food that contain fat that should be selected).
 - d. Iron-fortified cereal and a high-iron diet, adequate amounts of calcium and vitamin D, and vitamin C (4 to 6 oz [120 to 180 mL] of juice daily) are essential components for the toddler's diet.
 - e. Most toddlers prefer to feed themselves.
 - f. The toddler generally does best by eating several small nutritious meals each day rather than 3 large meals.
 - g. Offer a limited number of foods at any one time.

BOX 22-4 The Toddler's Vital Signs

Temperature: Axillary, 97.5°F to 98.6°F (36.4°C to 37°C)
 Apical Heart Rate: 80 to 120 beats/minute
 Respirations: 20 to 30 breaths/minute
 Blood Pressure: Average, 92/55 mm Hg

- h. Offer finger foods and avoid concentrated sweets and empty calories.
 - i. The toddler is at risk for aspiration of small foods that are not chewed easily, such as nuts, foods with seeds, raisins, popcorn, grapes, and hot dog pieces.
 - j. Physiological anorexia may occur and is normal because of the alternating stages of fast and slow growth.
 - k. Sit the toddler in a high chair at the family table for meals.
 - l. Allow sufficient time to eat, but remove food when the toddler begins to play with it.
 - m. The toddler drinks well from a cup held with both hands.
 - n. Avoid using food as a reward or punishment.
4. Skills
 - a. The toddler begins to walk with 1 hand held by age 12 to 13 months.
 - b. The toddler runs by age 2 years and walks backward and hops on 1 foot by age 3 years.
 - c. The toddler usually cannot alternate feet when climbing stairs.
 - d. The toddler begins to master fine motor skills for building, undressing, and drawing lines.
 - e. The young toddler often uses “no” even when he or she means “yes” to assert independence.
 - f. The toddler begins to use short sentences and has a vocabulary of about 300 words by age 2.
 5. Bowel and bladder control
 - a. Certain signs indicate that a toddler is ready for toilet training (Box 22-5).
 - b. Bowel control develops before bladder control.
 - c. By age 3, the toddler achieves fairly good bowel and bladder control.
 - d. The toddler may stay dry during the day but may need a diaper at night until about age 4.
 6. Play
 - a. The major socializing mechanism is parallel play, and therapeutic play can begin at this age.
 - b. The toddler has a short attention span, causing the toddler to change toys often.
 - c. The toddler explores body parts of self and others.

BOX 22-5 Signs of Readiness for Toilet Training

Child is able to stay dry for 2 hours.
 Child is waking up dry from a nap.
 Child is able to sit, squat, and walk.
 Child is able to remove clothing.
 Child recognizes the urge to defecate or urinate.
 Child expresses willingness to please a parent.
 Child is able to sit on the toilet for 5 to 10 minutes without fussing or getting off.

- d. Typical toys include push-pull toys, blocks, sand, finger paints and bubbles, large balls, crayons, trucks and dolls, containers, Play-Doh, toy telephones, cloth books, and wooden puzzles.

7. Safety

 Toddlers are eager to explore the world around them; they need to be supervised at play to ensure safety.

- a. Use back burners on the stove to prepare a meal; turn pot handles inward and toward the middle of the stove.
- b. Keep dangling cords from small appliances or other items away from the toddler.
- c. Place inaccessible locks on windows and doors, and keep furniture away from windows.
- d. Secure screens on all windows.
- e. Place safety gates at stairways.
- f. Do not allow the toddler to sleep or play in an upper bunk bed.
- g. Never leave the toddler alone near a bathtub, pail of water, swimming pool, or any other body of water.
- h. Keep toilet lids closed.
- i. Keep all medicines, poisons, household plants, and toxic products in high areas and locked out of reach.
- j. Keep the Poison Control Center number available.

C. Preschooler

1. Physical

- a. The preschooler grows 2½ to 3 inches (6.5 to 7.5 cm) per year.
- b. Average height is 37 inches (94 cm) at age 3, 40½ inches (103 cm) at age 4, and 43 inches (110 cm) at age 5.
- c. The preschooler gains approximately 5 pounds (2.25 kg) per year; average weight is 40 pounds (18 kg) at age 5.
- d. The preschooler requires about 12 hours of sleep each day.
- e. A security object and a nightlight help with sleeping.
- f. At the beginning of the preschool period, the eruption of the deciduous (primary) teeth is complete.
- g. Regular dental care is essential, and the preschooler may require assistance with brushing and flossing of teeth; fluoride supplements may be necessary if the water is not fluoridated.

2. Vital signs (Box 22-6)

3. Nutrition

- a. Nutritional needs are similar to those required for the toddler although the daily amounts of minerals, vitamins, and protein may increase with age.

BOX 22-6 The Preschooler's Vital Signs

Temperature: Axillary, 97.5°F to 98.6°F (36.4°C to 37°C)

Apical Heart Rate: 70 to 110 beats/minute

Respirations: 16 to 22 breaths/minute

Blood Pressure: Average, 95/57 mm Hg

- b. The MyPlate food guide is appropriate for preschoolers (see www.choosemyplate.gov).
- c. The preschooler exhibits food fads and certain taste preferences and may exhibit finicky eating.
- d. By 5 years old, the child tends to focus on social aspects of eating, table conversations, manners, and willingness to try new foods.

4. Skills

- a. The preschooler has good posture.
- b. The child develops fine motor coordination.
- c. The child can hop, skip, and run more smoothly.
- d. Athletic abilities begin to develop.
- e. The preschooler demonstrates increased skills in balancing.
- f. The child alternates feet when climbing stairs.
- g. The child can tie shoelaces by age 6.
- h. The child may talk continuously and ask many “why” questions.
- i. Vocabulary increases to about 900 words by age 3 and to 2100 words by age 5.
- j. By age 3, the preschooler usually talks in 3- or 4-word sentences and speaks in short phrases.
- k. By age 4, the preschooler speaks 5- or 6-word sentences, and by age 5, speaks in longer sentences that contain all parts of speech.
- l. The child can be understood readily by others and can understand clearly what others are saying.

5. Bowel and bladder control

- a. By age 4, the preschooler has daytime control of bowel and bladder but may experience bed-wetting accidents at night.
- b. By age 5, the preschooler achieves bowel and bladder control, although accidents may occur in stressful situations.

6. Play

- a. The preschooler is cooperative.
- b. The preschooler has imaginary playmates.
- c. The child likes to build and create things, and play is simple and imaginative.
- d. The child understands sharing and is able to interact with peers.
- e. The child requires regular socialization with mates of similar age.
- f. Play activities include a large space for running and jumping.
- g. The preschooler likes dress-up clothes, paints, paper, and crayons for creative expression.

- h. Swimming and sports aid in growth development.
 - i. Puzzles and toys aid with fine motor development.
7. Safety
- a. Preschoolers are active and inquisitive.
 - b. Because of their magical thinking, they may believe that daring feats seen in cartoons are possible and may attempt them.
 - c. The preschooler can learn simple safety practices because they can follow simple verbal directions and their attention span is longer.
 - d. Teach the preschooler basic safety rules to ensure safety when playing in a playground such as near swings and ladders.
 - e. Teach the preschooler never to play with matches or lighters.
 - f. The preschooler should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the preschooler.
 - g. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
 - h. Teach the preschooler his or her full name, address, parents' names, and telephone number.
 - i. Teach the preschooler how to dial 911 in an emergency situation.
 - j. Keep the Poison Control Center number available.

 **Teach a preschooler and school-age child to leave an area immediately if a gun is visible and to tell an adult. The preschooler should also be taught never to point a toy gun at another person.**

D. School-age child

1. Physical
- a. Girls usually grow faster than boys.
 - b. Growth is about 2 inches (5 cm) per year between ages 6 and 12.
 - c. Height ranges from 45 inches (115 cm) at age 6 to 59 inches (150 cm) at age 12.
 - d. School-age children gain weight at a rate of about 4½ to 6½ pounds (2 to 3 kg) per year.
 - e. Average weight is 46 pounds (21 kg) at age 6 and 88 pounds (40 kg) at age 12.
 - f. The first permanent (secondary) teeth erupt around age 6, and deciduous teeth are lost gradually.
 - g. Regular dentist visits are necessary, and the school-age child needs to be supervised with brushing and flossing teeth; fluoride supplements may be necessary if the water is not fluoridated.

BOX 22-7 The School-Age Child's Vital Signs

Temperature: Oral, 97.5°F to 98.6°F (36.4°C to 37°C)

Apical Heart Rate: 60 to 100 beats/minute

Respirations: 18 to 20 breaths/minute

Blood Pressure: Average, 107/64 mm Hg

- h. For school-age children with primary and permanent dentition, the best toothbrush is one with soft nylon bristles and an overall length of about 6 inches (15 cm).
 - i. Sleep requirements range from 10 to 12 hours a night.
2. Vital signs (Box 22-7)
3. Nutrition
- a. School-age children will have increased growth needs as they approach adolescence.
 - b. Children require a balanced diet from foods in the MyPlate food guide; healthy snacks should continue to be emphasized to prevent childhood obesity (see www.choosemyplate.gov).
 - c. Children still may be picky eaters but are usually willing to try new foods.
4. Skills
- a. School-age children exhibit refinement of fine motor skills.
 - b. Development of gross motor skills continues.
 - c. Strength and endurance increase.
5. Play
- a. Play is more competitive.
 - b. Rules and rituals are important aspects of play and games.
 - c. The school-age child enjoys drawing, collecting items, dolls, pets, guessing games, board games, listening to the radio, TV, reading, watching videos or DVDs, and computer games.
 - d. The child participates in team sports.
 - e. The child may participate in secret clubs, group peer activities, and scout organizations.
6. Safety
- a. The school-age child experiences less fear in play activities and frequently imitates real life by using tools and household items.
 - b. Major causes of injuries include bicycles, skateboards, and team sports as the child increases in motor abilities and independence.
 - c. Children should always wear a helmet when riding a bike or using in-line skates or skateboards.
 - d. Teach the child water safety rules.
 - e. Instruct the child to avoid teasing or playing roughly with animals.
 - f. Teach the child never to play with matches or lighters.

- g. The child should be taught what to do in the event of a fire or if clothes catch fire; fire drills should be practiced with the child.
- h. Guns should be stored unloaded and secured under lock and key (ammunition should be locked in a separate place).
- i. Teach the child traffic safety rules.
- j. Teach the child how to dial 911 in an emergency situation.
- k. Keep the Poison Control Center number available.

 Teach the preschooler and school-age child that if another person touches his or her body in an inappropriate way, an adult should be told. Also teach the child to avoid speaking to strangers and never to accept a ride, toys, or gifts from a stranger.

E. Adolescent

1. Physical

- a. Puberty is the maturational, hormonal, and growth process that occurs when the reproductive organs begin to function and the secondary sex characteristics develop.
- b. Body mass increases to adult size.
- c. Sebaceous and sweat glands become active and fully functional.
- d. Body hair distribution occurs.
- e. Increases in height, weight, breast development, and pelvic girth occur in girls.
- f. Menstrual periods occur about 2½ years after the onset of puberty.
- g. In boys, increases in height, weight, muscle mass, and penis and testicle size occur.
- h. The voice deepens in boys.
- i. Normal weight gain during puberty: Girls gain 15 to 55 pounds (7 to 25 kg); boys gain 15 to 65 pounds (7 to 30 kg).
- j. Careful brushing and care of the teeth are important, and many adolescents need to wear braces.
- k. Sleep patterns include a tendency to stay up late; therefore, in an attempt to catch up on missed sleep, adolescents sleep late whenever possible; an overall average of 8 hours per night is recommended.

2. Vital signs (Box 22-8)

3. Nutrition

- a. Teaching about the MyPlate food guide is important (see www.choosemyplate.gov).

- b. Adolescents typically eat whenever they have a break in activities.
 - c. Calcium, zinc, iron, folic acid, and protein are especially important nutritional needs.
 - d. Adolescents tend to snack on empty calories, and the importance of adequate and healthy nutrition needs to be stressed.
 - e. Body image is important.
- ### 4. Skills
- a. Gross and fine motor skills are well developed.
 - b. Strength and endurance increase.
- ### 5. Play
- a. Games and athletic activities are the most common forms of play.
 - b. Competition and strict rules are important.
 - c. Adolescents enjoy activities such as sports, videos, movies, reading, parties, dancing, hobbies, computer games, music, communicating via the Internet, and experimenting, such as with makeup and hairstyles.
 - d. Friends are important, and adolescents like to gather in small groups.
- ### 6. Safety
- a. Adolescents are risk takers.
 - b. Adolescents have a natural urge to experiment and to be independent.
 - c. Reinforce instructions about the dangers related to cigarette smoking, caffeine ingestion, alcohol, and drugs.
 - d. Help adolescents to recognize that they have choices when difficult or potentially dangerous situations arise.
 - e. Ensure that the adolescent uses a seat belt.
 - f. Instruct adolescents in the consequences of injuries that motor vehicle accidents can cause.
 - g. Instruct adolescents in water safety and emphasize that they should enter the water feet first as opposed to diving, especially when the depth of the water is unknown.
 - h. Instruct adolescents about the dangers associated with guns, violence, and gangs.
 - i. Instruct adolescents about the complications associated with body piercing, tattooing, and sun tanning.

 Discuss issues such as acquaintance rape, sexual relationships, and transmission of sexually transmitted infections with the adolescent. Also discuss the dangers of the Internet and social media related to communicating and setting up meetings (dates) with unknown persons.

F. Early adulthood

- 1. Description: Period between the late teens and mid to late 30s
- 2. Physical changes

BOX 22-8 The Adolescent's Vital Signs

Temperature: Oral, 97.5°F to 98.6°F (36.4°C to 37°C)
 Apical Heart Rate: 55 to 90 beats/minute
 Respirations: 12 to 20 breaths/minute
 Blood Pressure: Average, 121/70 mm Hg

- a. Person has completed physical growth by the age of 20.
 - b. Person is active.
 - c. Severe illnesses are less common than in older age groups.
 - d. Person tends to ignore physical symptoms and postpone seeking health care.
 - e. Lifestyle habits such as smoking, stress, lack of exercise, poor personal hygiene, and family history of disease increase the risk of future illness.
3. Cognitive changes
 - a. Person has rational thinking habits.
 - b. Conceptual, problem-solving, and motor skills increase.
 - c. Person identifies preferred occupational areas.
 4. Psychosocial changes
 - a. Person separates from family of origin.
 - b. Person gives much attention to occupational and social pursuits to improve socioeconomic status.
 - c. Person makes decisions regarding career, marriage, and parenthood.
 - d. Person needs to adapt to new situations.
 5. Sexuality
 - a. Person has the emotional maturity to develop mature sexual relationships.
 - b. Person is at risk for sexually transmitted infections.
- G. Middle adulthood
1. Description: Period between the mid to late 30s and mid 60s
 2. Physical changes
 - a. Physical changes occur between 40 and 65 years of age.
 - b. Individual becomes aware that changes in reproductive and physical abilities signify the beginning of another stage in life.
 - c. Menopause occurs in women and climacteric occurs in men.
 - d. Physiological changes often have an impact on self-concept and body image.
 - e. Physiological concerns include stress, level of wellness, and the formation of positive health habits.
 3. Cognitive changes
 - a. Person may be interested in learning new skills.
 - b. Person may become involved in educational or vocational programs for entering the job market or for changing careers.
 4. Psychosocial changes
 - a. Changes may include expected events, such as children moving away from home (postparental family stage), or unexpected events, such as the death of a close friend.
 - b. Time and financial demands decrease as children move away from home, and couples face redefining their relationship.
 - c. Adults may become grandparents.
 - d. Adults are achieving generativity.
5. Sexuality
 - a. Many couples renew their relationships and find increased marital and sexual satisfaction.
 - b. The onset of menopause and climacteric may affect sexual health.
 - c. Stress, health, and medications can affect sexuality.
- H. Later adulthood (period between 65 years and death): Refer to [Chapter 23](#).
- ### VIII. Gender Dysphoria Across the Lifespan
- A. The following section was adapted from Keltner, Steele (2015), pp. 371-372, DSM-5 Criteria
 - B. Children
 1. Description: An incongruence between one's experienced and expressed gender and assigned gender of a duration of at least 6 months and at least two of the following assessment findings; results in clinically significant distress in social, school, or other important areas of functioning.
 2. Assessment
 - a. A strong desire or insistence that one is the other gender
 - b. A strong preference for cross-dressing in female attire for boys; a strong preference for wearing masculine attire for girls
 - c. A strong preference for cross-gender roles in make-believe play
 - d. A strong preference for toys, games, or activities used stereotypically by the other gender
 - e. A strong preference for playmates of the other gender
 - f. Avoidance of rough play and masculine toys for boys, and avoidance of feminine toys for girls
 - C. Adolescents and Adults
 1. Description: An incongruence between one's experienced and expressed gender and assigned gender of a duration of at least 6 months and at least two of the following assessment findings. Results in clinically significant distress in social, occupational, or other important areas of functioning.
 2. Assessment
 - a. Incongruence between expressed gender and sex characteristics
 - b. A strong desire to be rid of one's sex characteristics because of incongruence with expressed gender

- c. A strong desire for sex characteristics of the other gender
 - d. A strong desire to be of the other gender
 - e. A strong desire to be treated as the other gender
 - f. A strong conviction that one has the typical feelings and reactions of the other gender
- D. Posttransition
1. The individual has transitioned to full-time living in the desired gender
 2. The individual has undergone or is preparing to undergo at least one cross-sex medical procedure or treatment regimen.

IX. End-of-Life Care

- A. Description: End-of-life care relates to death and dying.
- B. Cultural and religious issues (see [Chapter 5](#) and [Box 5-2](#) for information regarding cultural and religious issues)
- C. Legal and ethical issues
1. Outcomes related to care during illness and the dying experience should be based on the client's wishes.
 2. Issues for consideration may include organ and tissue donations, advance directives or other legal documents, withholding or withdrawing treatment, and cardiopulmonary resuscitation.
- D. Palliative care
1. Palliative care focuses on caring interventions and symptom management rather than cure for diseases or conditions that no longer respond to treatment.
 2. Pain and symptoms are controlled; the dying client should be as pain-free and as comfortable as possible.
 3. Hospice care provides support and care for clients in the last phases of incurable diseases so that they might live as fully and as comfortably as possible; client and family needs are the focus of any intervention.
- E. Near-death physiological manifestations
1. As death approaches, metabolism is reduced, and the body gradually slows down until all functions end.
 2. Sensory: The client experiences blurred vision, decreased sense of taste and smell, decreased pain and touch perception, and loss of blink reflex, and appears to stare (hearing is believed to be the last sense lost).
 3. Respirations
 - a. Respirations may be rapid or slow, shallow, and irregular.
 - b. Respirations may be noisy and wet sounding ("death rattle").

- c. Cheyne-Stokes respiration is alternating periods of apnea and deep, rapid breathing.
4. Circulation
- a. Heart rate slows, and blood pressure falls progressively.
 - b. Skin is cool to the touch, and the extremities become pale, mottled, and cyanotic.
 - c. Skin is waxlike very near death.
5. Urinary output decreases; incontinence may occur.
6. Gastrointestinal motility and peristalsis diminish, leading to constipation, gas accumulation, and distention; incontinence may occur.
7. Musculoskeletal system: The client gradually loses ability to move, has difficulty speaking and swallowing, and loses the gag reflex.
- F. Death
1. Death occurs when all vital organs and body systems cease to function.
 2. In general, respirations cease first, and then the heartbeat stops a few minutes thereafter.
 3. Brain death occurs when the cerebral cortex stops functioning or is irreversibly damaged.
- G. Nursing care
1. Frequency of assessment depends on the client's stability (at least every 4 hours); as changes occur, assessment needs to be done more frequently.
 2. Physical care ([Box 22-9](#))
 3. Psychosocial care
 - a. Monitor for anxiety and **depression**.
 - b. Monitor for fear ([Box 22-10](#)).
 - c. Encourage the client and family to express feelings.
 - d. Provide support and advocacy for the client and family.
 - e. Provide privacy for the client and family.
 - f. Provide a private room for the client.
 4. Postmortem care ([Box 22-11](#))
 - a. Maintain respect and dignity for the client.
 - b. Determine whether the client is an organ donor; if so, follow appropriate procedures related to the donation.
 - c. Consider cultural rituals, state laws, and agency procedures when performing postmortem care.
 - d. Prepare the body for immediate viewing by the family.
 - e. Provide privacy and time for the family to be with the deceased person.
 - f. Medical examiner jurisdiction guidelines are determined by each state and usually include nonnatural, traumatic, or question of criminal involvement deaths; any forensic evidence is preserved and the body is not cleaned or prepared prior to transfer to the morgue.

BOX 22-9 Physical Care of the Dying Client**Pain**

Administer pain medication.
Do not delay or deny pain medication.

Dyspnea

Elevate the head of the bed or position the client on his or her side.
Administer supplemental oxygen for comfort.
Suction fluids from the airway as needed.
Administer medications as prescribed.

Skin

Assess color and temperature.
Assess for breakdown.
Implement measures to prevent breakdown.

Dehydration

Maintain regular oral care.
Encourage taking ice chips and sips of fluid.
Do not force the client to eat or drink.
Use moist cloths to provide moisture to the mouth.
Apply lubricant to the lips and oral mucous membranes.

Anorexia, Nausea, and Vomiting

Provide antiemetics before meals.
Have family members provide the client's favorite foods.
Provide frequent small portions of favorite foods.

Elimination

Monitor urinary and bowel elimination.
Place absorbent pads under the client and check frequently.

Weakness and Fatigue

Provide rest periods.
Assess tolerance for activities.
Provide assistance and support as needed for maintaining bed or chair positions.

Restlessness

Maintain a calm, soothing environment.
Do not restrain.
Limit the number of visitors at the client's bedside (consider cultural practices).
Allow a family member to stay with the client.

BOX 22-10 Fear Associated with Dying**Fear of Pain**

Fear of pain may occur, based on anxieties related to dying.
Do not delay or deny pain-relief measures to a terminally ill client.

Fear of Loneliness and Abandonment

Allow family members to stay with the client.
Holding hands, touching (if culturally acceptable), and listening to the client are important.

Fear of Being Meaningless

Client may feel hopeless and powerless.
Encourage life reviews and focus on the positive aspects of the client's life.

Adapted from Lewis S, Dirksen S, Heitkemper M, Bucher L, Camera I: Medical-surgical nursing: assessment and management of clinical problems, ed 8, St. Louis, 2011, Mosby.

BOX 22-11 General Postmortem Procedures

Close the client's eyes.
Replace dentures.
Wash the body and change bed linens if needed.
Place pads under the perineum.
Remove tubes and dressings.
Straighten the body and place a pillow under the head in preparation for family viewing.

CRITICAL THINKING What Should You Do?

Answer: When caring for a child who is apprehensive, the nurse should provide a safe and secure environment. The nurse should also take time for communication with the child; allow the child to express feelings such as anxiety, fear, or anger; accept any regressive behavior and assist the preschooler in moving from regressive to appropriate behaviors. Additional interventions include encouraging rooming-in with the parents or leaving a favorite toy; allowing mobility and providing play and diversional activities; placing the preschooler with other children of the same age if possible; and encouraging the child to be independent. The nurse should also explain procedures simply, on the child's level; avoid intrusive procedures when possible; and allow the child to wear his or her underpants.

Reference: Hockenberry, Wilson (2015), pp. 537, 871-872.

PRACTICE QUESTIONS

211. A 4-year-old child diagnosed with leukemia is hospitalized for chemotherapy. The child is fearful of the hospitalization. Which nursing intervention should be implemented to alleviate the child's fears?
1. Encourage the child's parents to stay with the child.

2. Encourage play with other children of the same age.
 3. Advise the family to visit only during the scheduled visiting hours.
 4. Provide a private room, allowing the child to bring favorite toys from home.
212. A 16-year-old client is admitted to the hospital for acute appendicitis and an appendectomy is performed. Which nursing intervention is most appropriate to facilitate normal growth and development postoperatively?
1. Encourage the client to rest and read.
 2. Encourage the parents to room in with the client.
 3. Allow the family to bring in the client's favorite computer games.
 4. Allow the client to interact with others in his or her (Adolescent) same age group.
213. Which car safety device should be used for a child who is 8 years old and 4 feet tall?
1. Seat belt
 2. Booster seat
 3. Rear-facing convertible seat
 4. Front-facing convertible seat
214. The nurse assesses the vital signs of a 12-month-old infant with a respiratory infection and notes that the respiratory rate is 35 breaths/minute. On the basis of this finding, which action is most appropriate?
1. Administer oxygen.
 2. Document the findings.
 3. Notify the health care provider.
 4. Reassess the respiratory rate in 15 minutes.
215. The nurse is monitoring a 3-month-old infant for signs of increased intracranial pressure. On palpation of the fontanel, the nurse notes that the anterior fontanel is soft and flat. On the basis of this finding, which nursing action is most appropriate?
1. Increase oral fluids.
 2. Document the finding.
 3. Notify the health care provider (HCP).
 4. Elevate the head of the bed to 90 degrees.
216. The nurse is evaluating the developmental level of a 2-year-old. Which does the nurse expect to observe in this child?
1. Uses a fork to eat
 2. Uses a cup to drink
 3. Pours own milk into a cup
 4. Uses a knife for cutting food
217. A 2-year-old child is treated in the emergency department for a burn to the chest and abdomen. The child sustained the burn by grabbing a cup of hot coffee that was left on the kitchen counter. The nurse reviews safety principles with the parents before discharge. Which statement by the parents indicates an understanding of measures to provide safety in the home?
1. "We will be sure not to leave hot liquids unattended."
 2. "I guess our children need to understand what the word hot means."
 3. "We will be sure that the children stay in their rooms when we work in the kitchen."
 4. "We will install a safety gate as soon as we get home so the children cannot get into the kitchen."
218. A mother arrives at a clinic with her toddler and tells the nurse that she has a difficult time getting the child to go to bed at night. What measure is most appropriate for the nurse to suggest to the mother?
1. Allow the child to set bedtime limits.
 2. Allow the child to have temper tantrums.
 3. Avoid letting the child nap during the day.
 4. Inform the child of bedtime a few minutes before it is time for bed.
219. The mother of a 3-year-old is concerned because her child still is insisting on a bottle at nap time and at bedtime. Which is the most appropriate suggestion to the mother?
1. Allow the bottle if it contains juice.
 2. Allow the bottle if it contains water.
 3. Do not allow the child to have the bottle.
 4. Allow the bottle during naps but not at bedtime.
220. The nurse is preparing to care for a 5-year-old who has been placed in traction following a fracture of the femur. The nurse plans care, knowing that which is the most appropriate activity for this child?
1. A radio
 2. A sports video
 3. Large picture books
 4. Crayons and a coloring book
221. The mother of a 3-year-old asks a clinic nurse about appropriate and safe toys for the child. The nurse should tell the mother that the most appropriate toy for a 3-year-old is which?
1. A wagon
 2. A golf set
 3. A farm set
 4. A jack set with marbles
- ❖ 222. Which interventions are appropriate for the care of an infant? Select all that apply.
1. Provide swaddling.
 2. Talk in a loud voice.

- 3. Provide the infant with a bottle of juice at nap time.
 - 4. Hang mobiles with black and white contrast designs.
 - 5. Caress the infant while bathing or during diaper changes.
 - 6. Allow the infant to cry for at least 10 minutes before responding.
- ❖ 223. The nurse is preparing to care for a dying client, and several family members are at the client's bedside. Which therapeutic techniques should the

nurse use when communicating with the family? Select all that apply.

- 1. Discourage reminiscing.
- 2. Make the decisions for the family.
- 3. Encourage expression of feelings, concerns, and fears.
- 4. Explain everything that is happening to all family members.
- 5. Touch and hold the client's or family member's hand if appropriate.
- 6. Be honest and let the client and family know they will not be abandoned by the nurse.

ANSWERS

211. 1

Rationale: Although the preschooler already may be spending some time away from parents at a day care center or preschool, illness adds a stressor that makes separation more difficult. The child may ask repeatedly when parents will be coming for a visit or may constantly want to call the parents. Options 3 and 4 increase stress related to separation anxiety. Option 2 is unrelated to the subject of the question and, in addition, may not be appropriate for a child who may be immunocompromised and at risk for infection. Test-Taking Strategy: Note that the **subject** relates to the child's fear. Options 3 and 4 will increase anxiety and fear further and should be eliminated. Bearing the **subject** of the question in mind and considering the child's diagnosis will assist you in eliminating option 2.

Review: Measures to alleviate **separation anxiety**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Caring

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Anxiety; Development

Reference: Hockenberry, Wilson (2015), p. 871.

212. 4

Rationale: Adolescents often are not sure whether they want their parents with them when they are hospitalized. Because of the importance of their peer group, separation from friends is a source of anxiety. Ideally, the members of the peer group will support their ill friend. Options 1, 2, and 3 isolate the client from the peer group.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Consider the psychosocial needs of the adolescent and remember that the peer group is very important. Options 1, 2, and 3 are **comparable or alike** in that they isolate the client from his or her own peer group.

Review: Psychosocial needs of the **adolescent**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Caring

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Health Promotion

Reference: Hockenberry, Wilson (2015), pp. 874-875.

213. 2

Rationale: All children whose weight or height is above the forward-facing limit for their car safety seat should use a belt-positioning booster seat until the vehicle seat belt fits properly,

typically when they have reached 4 feet, 9 inches in height (145 cm) and are between 8 and 12 years of age. Infants should ride in a car in a semireclined, rear-facing position in an infant-only seat or a convertible seat until they weigh at least 20 pounds (9 kg) and are at least 1 year of age. The transition point for switching to the forward-facing position is defined by the manufacturer of the convertible car safety seat but is generally at a body weight of 9 kilograms (20 pounds) and 1 year of age.

Test-Taking Strategy: Focus on the **subject**, car safety, and note the age and height of the child to identify the appropriate safety device. Remember that children should remain in a booster seat until they are 8 to 12 years old and at least 4 feet, 9 inches (145 cm) tall.

Review: **Car safety**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Clinical Judgment; Safety

References: Hockenberry, Wilson (2015), p. 601; www.healthychildren.org

214. 2

Rationale: The normal respiratory rate in a 12-month-old infant is 20 to 40 breaths/minute. The normal apical heart rate is 90 to 130 beats/minute, and the average blood pressure is 90/56 mm Hg. The nurse would document the findings.

Test-Taking Strategy: Focus on the data in the question and note the **strategic words**, most appropriate. Recalling the normal vital signs of an infant and noting that the respiratory rate identified in the question is within the normal range will direct you to the correct option.

Review: Normal **vital signs** for the **infant**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Hockenberry, Wilson (2015), p. 254.

215. 2

Rationale: The anterior fontanel is diamond-shaped and located on the top of the head. The fontanel should be soft and flat in a normal infant, and it normally closes by 12 to 18 months of age. The nurse would document the finding because it is normal. There is no useful reason to increase oral fluids, notify the HCP, or elevate the head of the bed to 90 degrees.

Test-Taking Strategy: Note the **strategic words**, most appropriate, and the words soft and flat. This should provide you with the clue that this is a normal finding. A bulging or tense fontanel may result from crying or increased intracranial pressure.

Review: Assessment of the **fontanel**s

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Intracranial Regulation

Reference: Hockenberry, Wilson (2015), p. 255, 261.

216. 2

Rationale: By age 2 years, the child can use a cup and spoon correctly but with some spilling. By age 3 to 4, the child begins to use a fork. By the end of the preschool period, the child should be able to pour milk into a cup and begin to use a knife for cutting.

Test-Taking Strategy: Focus on the **subject**, the developmental level of a 2-year-old. Option 4 can be eliminated first because of the word knife. Next, think about the fine motor skills that need to be developed in selecting the correct option. With this in mind, eliminate options 1 and 3.

Review: Developmental skills of the **toddler**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Clinical Judgment; Development

Reference: Hockenberry, Wilson (2015), pp. 492, 497.

217. 1

Rationale: Toddlers, with their increased mobility and development of motor skills, can reach hot water or hot objects placed on counters and stoves and can reach open fires or stove burners above their eye level. The nurse should encourage parents to remain in the kitchen when preparing a meal, use the back burners on the stove, and turn pot handles inward and toward the middle of the stove. Hot liquids should never be left unattended or within the child's reach, and the toddler should always be supervised. The statements in options 2, 3, and 4 do not indicate an understanding of the principles of safety.

Test-Taking Strategy: Note the words indicates an understanding. Option 2 can be eliminated because it is mandating that the toddler understand what is and is not safe. The toddler is not developmentally able to understand danger. Options 3 and 4 are **comparable or alike** in that they isolate the child from the environment. The correct option is the only one that reflects an understanding of safety principles by the parents.

Review: Safety measures for the **toddler**

Level of Cognitive Ability: Evaluating

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Evaluation

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Safety

Reference: Hockenberry, Wilson (2015), pp. 515-516.

218. 4

Rationale: Toddlers often resist going to bed. Bedtime protests may be reduced by establishing a consistent before-bedtime routine and enforcing consistent limits regarding the child's bedtime behavior. Informing the child of bedtime a few

minutes before it is time for bed is the most appropriate option. Most toddlers take an afternoon nap and, until their second birthday, also may require a morning nap. Firm, consistent limits are needed for temper tantrums or when toddlers try stalling tactics.

Test-Taking Strategy: Note the **strategic words**, most appropriate, and focus on the **subject**, the toddler. Eliminate options 1, 2, and 3 by using concepts related to growth and development. Remember that preparing the toddler for an event will minimize resistive behavior.

Review: Sleep patterns for the **toddler**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Client Education; Development

Reference: Hockenberry, Wilson (2015), p. 509.

219. 2

Rationale: A toddler should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or any other sweet liquid because of the risk of nursing (bottle-mouth) caries. If a bottle is allowed at nap time or bedtime, it should contain only water.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Eliminate options 3 and 4 first because they are **comparable or alike** statements. From the remaining options, recalling that nursing (bottle-mouth) caries is a concern in a child will assist in directing you to the correct option.

Review: Instructions for the child who is **bottle-feeding**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Safety

Reference: Hockenberry, Wilson (2015), pp. 511-512.

220. 4

Rationale: In the preschooler, play is simple and imaginative, and includes activities such as crayons and coloring books, puppets, felt and magnetic boards, and Play-Doh. A radio or a sports video is most appropriate for the adolescent. Large picture books are most appropriate for the infant.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Note the age of the child, and think about the age-related activity that would be most appropriate. Eliminate options 1 and 2, knowing that they are most appropriate for the adolescent. From the remaining options, the word large in option 3 should provide you with the clue that this activity would be more appropriate for a child younger than age 5.

Review: **Age-appropriate activities**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Planning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Coping; Development

Reference: Hockenberry, Wilson (2015), p. 875.

221. 1

Rationale: Toys for the toddler must be strong, safe, and too large to swallow or place in the ear or nose. Toddlers need

supervision at all times. Push-pull toys, large balls, large crayons, large trucks, and dolls are some of the appropriate toys. A farm set, a golf set, and jacks with marbles may contain items that the child could swallow.

Test-Taking Strategy: Note the **strategic words**, most appropriate, and focus on the **subject**, the appropriate toy for a 3-year-old. Options 2, 3, and 4 can be eliminated because they are **comparable or alike** and could contain items that the child could swallow. Remember that large and strong toys are safest for the toddler.

Review: **Age-appropriate activities**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Safety

Reference: Hockenberry, Wilson (2015), p. 497.

❖ 222. 1, 4, 5

Rationale: Holding, caressing, and swaddling provide warmth and tactile stimulation for the infant. To provide auditory stimulation, the nurse should talk to the infant in a soft voice and should instruct the mother to do so also. Additional interventions include playing a music box, radio, or television, or having a ticking clock or metronome nearby. Hanging a bright shiny object in midline within 20 to 25 cm of the infant's face and hanging mobiles with contrasting colors, such as black and white, provide visual stimulation. Crying is an infant's way of communicating; therefore, the nurse would respond to the infant's crying. The mother is taught to do so also. An infant or child should never be allowed to fall asleep with a bottle containing milk, juice, soda pop, sweetened water, or another sweet liquid because of the risk of nursing (bottle-mouth) caries.

Test-Taking Strategy: Focus on the **subject**, care of the infant. Noting the word loud and the words at least 10 minutes before responding will assist in eliminating these interventions. Also, recalling the concerns related to dental caries will assist in eliminating option 3.

Review: Care of an **infant**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Implementation

Content Area: Developmental Stages—Infancy to Adolescence

Priority Concepts: Development; Safety

Reference: Lowdermilk et al. (2016), pp. 503-504.

❖ 223. 3, 5, 6

Rationale: The nurse must determine whether there is a spokesperson for the family and how much the client and family want to know. The nurse needs to allow the family and client the opportunity for informed choices and assist with the decision-making process if asked. The nurse should encourage expression of feelings, concerns, and fears and reminiscing. The nurse needs to be honest and let the client and family know they will not be abandoned. The nurse should touch and hold the client's or family member's hand, if appropriate.

Test-Taking Strategy: Use **therapeutic communication techniques** and recall client and family rights to assist in directing you to the correct options.

Review: **End-of-life care**

Level of Cognitive Ability: Analyzing

Client Needs: Psychosocial Integrity

Integrated Process: Caring

Priority Concepts: Family Dynamics; Palliation

Reference: Perry, Potter, Ostendorf, (2014), pp. 31, 388.

Care of the Older Client

PRIORITY CONCEPTS Development, Safety

CRITICAL THINKING What Should You Do?

The home care nurse is caring for an older female client who lives with her son and is physically and financially dependent on him. The nurse notes multiple bruises on the client's arms and asks the client how these bruises occurred. The client confides in the nurse that her son takes out his anger on her sometimes. What should the nurse do?

Answer located on p. 285.

I. Aging and Gerontology

- A. Aging is the biopsychosocial process of change that occurs in a person between birth and death.
- B. Gerontology is the study of the aging process.

II. Physiological Changes

A. Integumentary system

1. Loss of pigment in hair and skin
2. Wrinkling of the skin
3. Thinning of the epidermis and easy bruising and tearing of the skin
4. Decreased skin turgor, elasticity, and subcutaneous fat
5. Increased nail thickness and decreased nail growth
6. Decreased perspiration
7. Dry, itchy, scaly skin
8. Seborrheic dermatitis and keratosis formation (overgrowth and thickening of the skin)

B. Neurological system

1. Slowed reflexes
2. Slight tremors and difficulty with fine motor movement
3. Loss of balance
4. Increased incidence of awakening after sleep onset
5. Increased susceptibility to hypothermia and hyperthermia
6. Short-term memory decline possible
7. Long-term memory usually maintained

C. Musculoskeletal system

1. Decreased muscle mass and strength and atrophy of muscles
2. Decreased mobility, range of motion, flexibility, coordination, and stability
3. Change of gait, with shortened step and wider base
4. Posture and stature changes causing a decrease in height (Fig. 23-1)
5. Increased brittleness of the bones
6. Deterioration of joint capsule components
7. Kyphosis of the dorsal spine (increased convexity in the curvature of the spine)

! The older client is at risk for falls because of the changes that occur in the neurological and musculoskeletal systems.

D. Cardiovascular system

1. Diminished energy and endurance, with lowered tolerance to exercise
2. Decreased compliance of the heart muscle, with heart valves becoming thicker and more rigid
3. Decreased cardiac output and decreased efficiency of blood return to the heart
4. Decreased compensatory response, so less able to respond to increased demands on the cardiovascular system
5. Decreased resting heart rate
6. Weak peripheral pulses
7. Increased blood pressure but susceptibility to postural hypotension

E. Respiratory system

1. Decreased stretch and compliance of the chest wall
2. Decreased strength and function of respiratory muscles
3. Decreased size and number of alveoli
4. Respiratory rate usually unchanged
5. Decreased depth of respirations and oxygen intake
6. Decreased ability to cough and expectorate sputum

FIGURE 23-1 A normal spine at age 40 years of age and osteoporotic changes at 60 and 70 years of age. These changes can cause a loss of as much as 6 inches (15 cm) in height and can result in the so-called dowager's hump (far right) in the upper thoracic vertebrae.

F. Hematological system

1. Hemoglobin and hematocrit levels average toward the low end of normal
2. Prone to increased blood clotting
3. Decreased protein available for protein-bound medications

G. Immune system

1. Tendency for lymphocyte counts to be low with altered immunoglobulin production
2. Decreased resistance to infection and disease

H. Gastrointestinal system

1. Decreased need for calories because of lowered basal metabolic rate
2. Decreased appetite, thirst, and oral intake
3. Decreased lean body weight
4. Decreased stomach emptying time
5. Increased tendency toward constipation
6. Increased susceptibility for dehydration
7. Tooth loss
8. Difficulty in chewing and swallowing food

I. Endocrine system

1. Decreased secretion of hormones, with specific changes related to each hormone's function
2. Decreased metabolic rate
3. Decreased glucose tolerance, with resistance to insulin in peripheral tissues

J. Renal system

1. Decreased kidney size, function, and ability to concentrate urine

2. Decreased glomerular filtration rate
3. Decreased capacity of the bladder
4. Increased residual urine and increased incidence of infection and possibly incontinence
5. Impaired medication excretion

K. Reproductive system

1. Decreased testosterone production and decreased size of the testes
2. Changes in the prostate gland, leading to urinary problems
3. Decreased secretion of hormones with the cessation of menses
4. Vaginal changes, including decreased muscle tone and lubrication
5. Impotence or sexual dysfunction for both sexes; sexual function varies and depends on general physical condition, mental health status, and medications

L. Special senses

1. Decreased visual acuity
2. Decreased accommodation in eyes, requiring increased adjustment time to changes in light
3. Decreased peripheral vision and increased sensitivity to glare
4. Presbyopia and cataract formation
5. Possible loss of hearing ability; low-pitched tones are heard more easily
6. Inability to discern taste of food
7. Decreased sense of smell
8. Changes in touch sensation
9. Decreased pain awareness

III. Psychosocial Concerns

- A. Adjustment to deterioration in physical and mental health and well-being
- B. Threat to independent functioning and fear of becoming a burden to loved ones
- C. Adjustment to retirement and loss of income
- D. Loss of skills and competencies developed early in life
- E. Coping with changes in role function and social life
- F. Diminished quantity and quality of relationships and coping with loss
- G. Dependence on governmental and social systems
- H. Access to social support systems
- I. Costs of health care and medications

IV. Mental Health Concerns

- A. **Depression:** The increased dependency that older adults may experience can lead to hopelessness, helplessness, lowered sense of self-control, and decreased self-esteem and self-worth; these changes can interfere with daily functioning and lead to depression.
- B. **Grief:** Client reacts to the perception of loss, including physical, psychological, social, and spiritual aspects.

- C. Isolation: Client is alone and desires contact with others but is unable to make that contact.
- D. Suicide: Depression can lead to thoughts of self-harm.
- E. Depression differs from delirium and **dementia** (Table 23-1).

 Any suicide threat made by an older client should be taken seriously.

V. Pain

- A. Description
 1. Pain can occur from numerous causes and most often occurs from degenerative changes in the musculoskeletal system.
 2. The nurse needs to monitor the older client closely for signs of pain; failure to alleviate pain in the older client can lead to functional limitations affecting his or her ability to function independently.
- B. Assessment
 1. Restlessness
 2. Verbal reporting of pain
 3. Agitation
 4. Moaning
 5. Crying
- C. Interventions
 1. Monitor the client for signs of pain.
 2. Identify the pattern of pain.

3. Identify the precipitating factor(s) for the pain.
4. Monitor the impact of the pain on activities of daily living.
5. Provide pain relief through measures such as distraction, relaxation, massage, and biofeedback.
6. Administer pain medication as prescribed, and instruct the client in its use.
7. Evaluate the effects of pain-reducing measures.

VI. Infection (Box 23-1)

- A. Confusion is a common sign of infection in the older adult, especially infection of the urinary tract.

BOX 23-1 Nonspecific Symptoms That Possibly Indicate Illness or Infection

- Anorexia
- Apathy
- Changes in functional status
- Confusion
- Dyspnea
- Falling
- Fatigue
- Incontinence
- Self-neglect
- Shortness of breath
- Tachypnea
- Vital sign changes

TABLE 23-1 Differentiating Delirium, Depression, and Dementia

Characteristic	Delirium	Depression	Dementia
Onset	Sudden, abrupt	Recent, may relate to life change	Insidious, slow, over years and often unrecognized until deficits are obvious
Course over 24 hr	Fluctuating, often worse at night	Fairly stable, may be worse in the morning	Fairly stable, may see changes with stress; sundowning may occur
Consciousness	Reduced	Clear	Clear
Alertness	Increased, decreased, or variable	Normal	Generally normal
Psychomotor activity	Increased, decreased, or mixed	Variable; agitation or retardation	Normal; may have apraxia or agnosia; agitation can occur
Duration	Hours to weeks	Variable and may be chronic	Years
Attention	Disordered, fluctuates	Little impairment	Generally normal but may have trouble focusing; overwhelmed with multiple stimuli
Orientation	Usually impaired, fluctuates	Usually normal, may answer “I don’t know” to questions or may not try to answer	Often impaired, may make up answers or answer close to the right thing, or may confabulate, but tries to answer
Speech	Often incoherent, slow or rapid, may call out repeatedly or repeat the same phrase	May be slow	Difficulty finding word, perseveration
Affect	Variable but may look disturbed, frightened	Flat	Slowed response, may be labile

Adapted from Sendelbach S, Guthrie PF, Schoenfelder DP: Acute confusion/delirium, *J Gerontol Nurse* 35(11):11–18, 2009.

- B. Carefully monitor the older adult with infection because of the diminished and altered immune response.
- C. Nonspecific symptoms may indicate illness or infection (see [Box 23-1](#)).

VII. Medications

- A. Major problems with prescriptive medications include adverse effects, medication interactions, medication errors, noncompliance, polypharmacy, and cost. See [Box 23-2](#) for information on medications to avoid in the older adult client. This information is based on Beers Criteria from the American Geriatrics Society. Information on this criteria and a full list of medications to avoid can be located at <http://www.americangeriatrics.org/files/documents/beers/BeersCriteriaPublicTranslation.pdf>
- B. Determine the use of over-the-counter medications.
- C. **Polypharmacy**

BOX 23-2 Medications to Avoid in the Older Client

Analgesics

- Indomethacin
- Ketorolac
- Nonsteroidal antiinflammatory drugs (NSAIDs)
- Meperidine

Antidepressants

- First-generation tricyclic antidepressants

Antihistamines

- First-generation antihistamines

Antihypertensives

- Alpha₁-blockers
- Centrally acting alpha₂-agonists

Urge Incontinence Medications

- Oxybutynin
- Tolterodine

Muscle Relaxants

- Carisoprodol
- Cyclobenzaprine
- Metaxalone
- Methocarbamol

Sedative-Hypnotics

- Barbiturates
- Benzodiazepines

1. Routinely monitor the number of prescription and nonprescription medications used and determine whether any can be eliminated or combined.
 2. Keep the use of medications to a minimum.
 3. Overprescribing medications leads to increased problems with more side and adverse effects, increased interaction between medications, duplication of medication treatment, diminished quality of life, and increased costs.
- D. Medication dosages normally are prescribed at one third to one half of normal adult dosages.
 - E. Closely monitor the client for adverse effects and response to therapy because of the increased risk for medication toxicity (see [Box 23-2](#)).
 - F. Assess for medication interactions in the client taking multiple medications.
 - G. Advise the client to use 1 pharmacy and notify the consulting health care provider(s) of the medications taken.
-  A common sign of an adverse reaction to a medication in the older client is a sudden change in mental status.

- H. Safety measures for medication administration (See [Priority Nursing Actions](#) Box)
 1. The client should be in a sitting position when taking medication.
 2. The mouth is checked for dryness because medication may stick and dissolve in the mouth.
 3. Liquid preparations can be used if the client has difficulty swallowing tablets.
 4. Tablets can be crushed if necessary and given with textured food (nectar, applesauce) if not contraindicated.
 5. Enteric-coated tablets are not crushed and capsules are not opened.
 6. If administering a suppository, avoid inserting the suppository immediately after removing it from the refrigerator; a suppository may take a while to dissolve because of decreased body core temperature.
 7. When administering parenteral solution or medication, monitor the site, because it may ooze or bleed due to decreased tissue elasticity; an immobile limb is not used for administering parenteral medication.
 8. Monitor client compliance with taking prescribed medications.
 9. Monitor the client for safety in correctly taking medications, including an assessment of his or her ability to read the instructions and discriminate among the pills and their colors and shapes.
 10. Use a medication cassette to facilitate proper administration of medication.

⚡ PRIORITY NURSING ACTIONS

Administering Oral Medications to a Client at Risk for Aspiration

1. Check the medication prescription and compare against the medical record. Clarify any incomplete prescriptions prior to administration. Check the 6 rights of medication administration.
2. Review pertinent information related to the medication and any related nursing considerations, such as laboratory parameters.
3. Assess for any contraindications to the administration of oral medications, such as NPO (nothing by mouth) status or decreased level of consciousness.
4. Place the client in a high Fowler's position. Assess aspiration risk using a screening tool or per agency policy. Check for an ability to swallow and cough on command. Check for the presence of a gag reflex. Following this assessment, if aspiration is a serious concern, the nurse would collaborate with the health care provider and speech therapist before administering the medication.
5. Prepare the medication in the form that is easiest to swallow, checking the 6 rights of medication administration again. Mix medications whole or crush medications and mix with applesauce or pudding if indicated (use sugar-free products for clients with diabetes). Do not crush sustained-release tablets, and use liquid preparations when possible. Thicken liquids when indicated, and avoid the use of straws.
6. Check the 6 rights of medication administration for the last time, and administer the medications 1 at a time in the prepared form, ensuring that the client has effectively swallowed everything. Ensure that the client is comfortable and safe, and document the medications given using an electronic system or per agency policy.

If a client is determined to be at risk for aspiration, there are specific actions the nurse should take to ensure client safety when administering oral medications. As with the administration of any medication, the nurse checks the medication prescription and compares it against the medical record clarifying any incomplete prescriptions; checks the 6 rights of medication administration: right client, right medication, right time, right route, right frequency, and right purpose; reviews any pertinent information related to medication administration, such as the international normalized ratio for the client taking warfarin; and assesses for any contraindications for administration of oral medications, such as NPO status. Next, the nurse places the client in a high Fowler's position and assesses for the client's aspiration risk using the agency-approved screening tool to determine if it is safe to administer oral medications, checking for the ability to swallow and cough on command and checking for the presence of a gag reflex. If the client is unable to swallow or does not have a gag reflex then the nurse would not administer the medications and would collaborate with the health care provider. If the client is able to swallow and cough and has a gag reflex then the nurse checks the 6 rights of medication administration again and prepares the medications and any liquids used in the most appropriate form based on the outcome of the swallow screen. Next, the nurse checks the 6 rights of medication administration immediately before administration for the last time, administers the medications 1 at a time in the prepared form, and ensures that the client has effectively swallowed each medication. The nurse then ensures that the client is comfortable and safe and documents the medications given per agency policy.

VIII. Abuse of the Older Adult

- A. Domestic mistreatment takes place in the home of the older adult and is usually carried out by a family member or significant other; this can include physical maltreatment, **neglect**, or abandonment.
- B. Institutional mistreatment takes place when an older adult experiences **abuse** when hospitalized or living somewhere other than home (e.g., long-term care facility).
- C. **Self-neglect** is the choice by a mentally competent individual to avoid medical care or other services that could improve optimal function, to not care for oneself, and to engage in actions that negatively affect his or her personal safety; unless declared legally incompetent, an individual has the right to refuse care.

 **Individuals at most risk for abuse include those who are dependent because of their immobility or altered mental status.**

- D. For additional information on abuse of the older client, see Chapter 71.

CRITICAL THINKING What Should You Do?

Answer: If the nurse suspects or knows for certain that elder abuse is occurring, the nurse should report this abuse to the appropriate authorities and follow state and agency guidelines in doing so. The nurse should then perform a thorough assessment of physical injuries, while providing confidentiality during the assessment with an empathetic and non-judgmental approach. The nurse should reassure the victim that he or she has done nothing wrong. The nurse should also assist the victim in developing self-protective and problem-solving skills. Even if the victim is not ready to leave the situation, encourage the victim to develop a specific safety plan (a fast escape if the violence returns) and know where to obtain help (hotlines, safe houses, and shelters); an abused person is usually reluctant to call the police.

Reference: Lewis, Dirksen, Heitkemper, Bucher (2014), pp. 68–69.

PRACTICE QUESTIONS

224. The nurse is providing medication instructions to an older client who is taking digoxin daily. The nurse explains to the client that decreased lean body mass and decreased glomerular filtration rate, which are age-related body changes, could place the client at risk for which complication with medication therapy?
1. Decreased absorption of digoxin
 2. Increased risk for digoxin toxicity
 3. Decreased therapeutic effect of digoxin
 4. Increased risk for side effects related to digoxin
225. The nurse is caring for an older client in a long-term care facility. Which action contributes to encouraging autonomy in the client?
1. Planning meals
 2. Decorating the room
 3. Scheduling haircut appointments
 4. Allowing the client to choose social activities
226. The home care nurse is visiting an older client whose spouse died 6 months ago. Which behaviors by the client indicates effective coping? Select all that apply.
1. Neglecting personal grooming
 2. Looking at old snapshots of family
 3. Participating in a senior citizens program
 4. Visiting the spouse's grave once a month
 5. Decorating a wall with the spouse's pictures and awards received
227. The nurse is providing instructions to the unlicensed assistive personnel (UAP) regarding care of an older client with hearing loss. What should the nurse tell the UAP about older clients with hearing loss?
1. They are often distracted.
 2. They have middle ear changes.
 3. They respond to low-pitched tones.
 4. They develop moist cerumen production.
228. The nurse is providing an educational session to new employees, and the topic is abuse of the older client. The nurse helps the employees to identify which client as most typically a victim of abuse?
1. A man who has moderate hypertension
 2. A man who has newly diagnosed cataracts
 3. A woman who has advanced Parkinson's disease
 4. A woman who has early diagnosed Lyme disease
229. The nurse is performing an assessment on an older client who is having difficulty sleeping at night. Which statement by the client indicates the need for further teaching regarding measures to improve sleep?
1. "I swim 3 times a week."
 2. "I have stopped smoking cigars."
 3. "I drink hot chocolate before bedtime."
 4. "I read for 40 minutes before bedtime."
230. The visiting nurse observes that the older male client is confined by his daughter-in-law to his room. When the nurse suggests that he walk to the den and join the family, he says, "I'm in everyone's way; my daughter-in-law needs me to stay here." Which is the most important action for the nurse to take?
1. Say to the daughter-in-law, "Confining your father-in-law to his room is inhumane."
 2. Suggest to the client and daughter-in-law that they consider a nursing home for the client.
 3. Say nothing, because it is best for the nurse to remain neutral and wait to be asked for help.
 4. Suggest appropriate resources to the client and daughter-in-law, such as respite care and a senior citizens center.
231. The nurse is performing an assessment on an older adult client. Which assessment data would indicate a potential complication associated with the skin?
1. Crusting
 2. Wrinkling
 3. Deepening of expression lines
 4. Thinning and loss of elasticity in the skin
232. The home health nurse is visiting a client for the first time. While assessing the client's medication history, it is noted that there are 19 prescriptions and several over-the-counter medications that the client has been taking. Which intervention should the nurse take first?
1. Check for medication interactions.
 2. Determine whether there are medication duplications.
 3. Call the prescribing health care provider (HCP) and report polypharmacy.
 4. Determine whether a family member supervises medication administration.
233. The long-term care nurse is performing assessments on several of the residents. Which are normal age-related physiological changes the nurse should expect to note? Select all that apply.
1. Increased heart rate
 2. Decline in visual acuity
 3. Decreased respiratory rate
 4. Decline in long-term memory
 5. Increased susceptibility to urinary tract infections
 6. Increased incidence of awakening after sleep onset

ANSWERS

224. 2

Rationale: The older client is at risk for medication toxicity because of decreased lean body mass and an age-associated decreased glomerular filtration rate. This age-related change is not specifically associated with decreased absorption, decreased therapeutic effect, or increased risk for side effects. Toxicity, or toxic effects, occurs as a result of excessive accumulation of the medication in the body.

Test-Taking Strategy: Focus on the **subject**, age-related body changes that could place the client at risk for medication toxicity. Recall that toxicity occurs as a result of medication accumulation in the body, which usually occurs as a result of decreased renal function. Note that the correct option is the only one that addresses renal excretion.

Review: Risks for **medication toxicity** in the **older client**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Client Education; Safety

Reference: Lewis et al. (2014), pp. 73-74, 112.

225. 4

Rationale: Autonomy is the personal freedom to direct one's own life as long as it does not impinge on the rights of others. An autonomous person is capable of rational thought. This individual can identify problems, search for alternatives, and select solutions that allow continued personal freedom as long as others and their rights and property are not harmed. Loss of autonomy, and therefore independence, is a real fear of older clients. The correct option is the only one that allows the client to be a decision maker.

Test-Taking Strategy: Focus on the **subject**, encouraging autonomy. Recalling the definition of autonomy will direct you to the correct option. Remember that giving the client choices is essential to promote independence.

Review: **Autonomy**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Caring

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Health Care Quality; Professionalism

Reference: Zerwekh, Zerwekh Garneau (2015), p. 421.

❖ 226. 2, 3, 4, 5

Rationale: Coping mechanisms are behaviors used to decrease stress and anxiety. In response to a death, ineffective coping is manifested by an extreme behavior that in some cases may be harmful to the individual physically or psychologically. Neglecting personal grooming is indicative of a behavior that identifies ineffective coping in the grieving process. The remaining options identify appropriate and effective coping mechanisms.

Test-Taking Strategy: Note the **strategic word**, effective, and focus on the **subject**, effective coping behaviors. Note that options 2, 3, 4, and 5 are **comparable or alike** and are positive activities in which the individual is engaging to get on with his or her life.

Review: **Coping mechanisms**

Level of Cognitive Ability: Analyzing

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Mental Health

Priority Concepts: Coping; Family Dynamics

References: Lewis et al. (2014), p. 144

Varcacolis (2013), pp. 491-492.

227. 3

Rationale: Presbycusis refers to the age-related irreversible degenerative changes of the inner ear that lead to decreased hearing ability. As a result of these changes, the older client has a decreased response to high-frequency sounds. Low-pitched voice tones are heard more easily and can be interpreted by the older client. Options 1, 2, and 4 are not accurate characteristics related to aging. Test-Taking Strategy: Focus on the **subject**, age-related changes related to hearing. Think about the physiological changes associated with aging. Recalling that the client with a hearing loss responds to low-pitched tones will direct you to the correct option.

Review: **Presbycusis** and **hearing loss**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Development; Sensory Perception

Reference: Lewis et al. (2014), pp. 410-411.

228. 3

Rationale: Elder abuse includes physical, sexual, or psychological abuse; misuse of property; and violation of rights. The typical abuse victim is a woman of advanced age with few social contacts and at least 1 physical or mental impairment that limits her ability to perform activities of daily living. In addition, the client usually lives alone or with the abuser and depends on the abuser for care.

Test-Taking Strategy: Focus on the **subject**, elder abuse. Note the **strategic word**, most. Read each option carefully and identify the client who is most defenseless as the result of the disease process. This will direct you to the correct option.

Review: **Elder abuse**

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Assessment

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Interpersonal Violence; Safety

References: Lewis et al. (2014), pp. 68-69

Perry, Potter, Ostendorf (2014), pp. 112, 115.

229. 3

Rationale: Many nonpharmacological sleep aids can be used to influence sleep. However, the client should avoid caffeinated beverages and stimulants such as tea, cola, and chocolate. The client should exercise regularly, because exercise promotes sleep by burning off tension that accumulates during the day. A 20- to 30-minute walk, swim, or bicycle ride 3 times a week is helpful. Smoking and alcohol should be avoided. Reading is also a helpful measure and is relaxing.

Test-Taking Strategy: Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 are positive statements indicating that the client understands the methods of improving sleep. Remember that chocolate contains caffeine.

Review: Sleep in the **older client**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Client Education; Palliation

Reference: Lewis et al. (2014), pp. 75, 109-110.

230. 4

Rationale: Assisting clients and families to become aware of available community support systems is a role and responsibility of the nurse. Observing that the client has begun to be confined to his room makes it necessary for the nurse to intervene legally and ethically, so option 3 is not appropriate and is passive in terms of advocacy. Option 2 suggests committing the client to a nursing home and is a premature action on the nurse's part. Although the data provided tell the nurse that this client requires nursing care, the nurse does not know the extent of the nursing care required. Option 1 is incorrect and judgmental. Test-Taking Strategy: Note the **strategic words**, most important. Using principles related to the ethical and legal responsibility of the nurse and knowledge of the nurse's role will direct you to the correct option. Option 1 is a nontherapeutic statement, option 2 is a premature action, and option 3 avoids the situation.

Review: **Ethical and legal principles** related to the **older adult**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Ethics; Health Care Law

Reference: Lewis et al. (2014), pp. 68, 70-71.

231. 1

Rationale: The normal physiological changes that occur in the skin of older adults include thinning of the skin, loss of elasticity, deepening of expression lines, and wrinkling. Crusting noted on the skin would indicate a potential complication.

Test-Taking Strategy: Note the **subject**, a potential complication. Think about the normal physiological changes that occur in the aging process in the integumentary system to direct you to the correct option.

Review: **Age-related skin changes**

Level of Cognitive Ability: Analyzing

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Clinical Judgment; Tissue Integrity

References: Jarvis (2016), p. 230

Lewis et al. (2014), pp. 416-417.

232. 2

Rationale: Polypharmacy is a concern in the older client. Duplication of medications needs to be identified before medication interactions can be determined, because the nurse needs to know what the client is taking. Asking about medication administration supervision may be part of the assessment but is not a first action. The phone call to the HCP is the intervention after all other information has been collected.

Test-Taking Strategy: Note the **strategic word**, first. Also note that the nurse is visiting the client for the first time. Options 1, 3, and 4 should be done after possible medication duplication has been identified.

Review: **Polypharmacy**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Fundamentals of Care—Safety

Priority Concepts: Clinical Judgment; Safety

Reference: Ignatavicius, Workman (2016), pp. 13-14.

❖ 233. 2, 5, 6

Rationale: Anatomical changes to the eye affect the individual's visual ability, leading to potential problems with activities of daily living. Light adaptation and visual fields are reduced. Although lung function may decrease, the respiratory rate usually remains unchanged. Heart rate decreases and heart valves thicken. Age-related changes that affect the urinary tract increase an older client's susceptibility to urinary tract infections. Short-term memory may decline with age, but long-term memory usually is maintained. Change in sleep patterns is a consistent, age-related change. Older persons experience an increased incidence of awakening after sleep onset.

Test-Taking Strategy: Focus on the **subject**, normal age-related changes. Read each characteristic carefully and think about the physiological changes that occur with aging to select the correct items.

Review: **Normal age-related changes**

Level of Cognitive Ability: Analyzing

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Developmental Stages—Early Adulthood to Later Adulthood

Priority Concepts: Development; Sensory Perception

Reference: Lewis et al. (2014), p. 65.

UNIT VI

Maternity Nursing

Pyramid to Success

The Pyramid to Success focuses on the physiological and psychosocial aspects related to the experience of pregnancy, birth, and the postpartum period. Pyramid Points begin with the assessment and knowledge of expected findings of the pregnant client and fetus during the antepartum period. Instructing the pregnant client in measures that promote a healthy environment for the mother and the fetus is included. The focus is on the importance of antepartum follow-up, nutrition, and interventions for common discomforts that occur during pregnancy. Knowledge of the purpose of the commonly prescribed diagnostic tests and procedures in the antepartum period is also part of the Pyramid to Success. The focus is on disorders that can occur during pregnancy, particularly gestational hypertension and diabetes mellitus. The labor and birth process and the immediate interventions for conditions in which the maternal or fetal status is compromised, such as prolapsed cord or altered fetal heart rate, are part of the Pyramid to Success. Review of the fetus of a mother with human immunodeficiency virus or acquired immunodeficiency syndrome or a substance-abusing mother is recommended. The Pyramid to Success also includes a focus on the normal expectations of the postpartum period and the complications that can occur during this time. The next Pyramid Point focuses on the normal physical assessment findings and early identification of disorders in the neonate. The last Pyramid Point in this unit focuses on maternity and newborn medications.

Client Needs: Learning Objectives

Safe and Effective Care Environment

Consulting with the interprofessional health care team
Ensuring that informed consent for diagnostic tests and procedures has been obtained

Establishing priorities of care
Handling hazardous and infectious materials safely
Maintaining confidentiality
Providing continuity of client care
Promoting a safe environment from potential teratogenic threats
Upholding client's rights
Using surgical asepsis when providing care
Using standard and transmission-based precautions when providing care

Health Promotion and Maintenance

Assessing for growth and development
Discussing expected body image changes with the client
Discussing family planning and birthing and parenting issues
Identifying at-risk clients during pregnancy
Identifying health and wellness concepts and providing health care screening
Identifying lifestyle choices and high-risk behaviors
Performing techniques of physical assessment
Providing antepartum, intrapartum, postpartum, and newborn care
Teaching regarding antepartum, intrapartum, and postpartum care, and care to the newborn

Psychosocial Integrity

Considering cultural, religious, and spiritual influences regarding birth and motherhood
Discussing situational role changes in the family
Ensuring therapeutic interactions within the family
Identifying available support systems
Identifying coping mechanisms

Physiological Integrity

Instructing the client about prescribed diagnostic tests and procedures
Monitoring for expected outcomes and effects related to pharmacological and parenteral therapies

Monitoring for normal expectations during pregnancy
Monitoring for side effects and adverse effects related to prescribed pharmacological and parenteral therapies
Monitoring the client during the labor and birth process
Providing interventions for unexpected events during pregnancy

Providing nonpharmacological comfort interventions and pharmacological pain management during labor
Supporting families who are experiencing fertility issues
Teaching the client about nutrition during pregnancy and in the postpartum period
Teaching the client about the physiological changes that occur during pregnancy

Reproductive System

PRIORITY CONCEPTS Reproduction, Sexuality

CRITICAL THINKING What Should You Do?

The nurse is conducting an intake assessment on a pregnant adolescent who reports consuming small amounts of alcohol on a daily basis. On the basis of the information provided, what should the nurse do?

Answer located on p. 295.

I. Female Reproductive Structures

- A. Ovaries
 1. Form and expel ova
 2. Secrete estrogen and progesterone
- B. Fallopian tubes
 1. Muscular tubes (oviducts) lying near the ovaries and connected to the uterus
 2. Tubes that propel the ova from the ovaries to the uterus
- C. Uterus
 1. Muscular, pear-shaped cavity in which the fetus develops
 2. Cavity from which menstruation occurs
- D. Cervix
 1. The internal os of the cervix opens into the body of the uterine cavity.
 2. The cervical canal is located between the internal os and the external os.
 3. The external cervical os opens into the vagina.
- E. Vagina
 1. Muscular tube that extends from the cervix to the vaginal opening in the perineum
 2. Known as the birth canal
 3. Passageway for menstrual blood flow, for penis for intercourse, and for the fetus

II. Male Reproductive Structures

- A. Penis
 1. Structures include the body or shaft, glans penis, and urethra.

2. Primary functions include pathway for urination and the organ used for intercourse.
- B. Scrotum
 1. Structures include the testes, epididymis, and vas deferens.
 2. Normal temperature is slightly cooler than body temperature.
 - C. Prostate gland
 1. Secretes a milky alkaline fluid
 2. Enhances sperm movement and neutralizes acidic vaginal secretions

III. Menstrual Cycle (Box 24-1)

- A. Ovarian hormones
 1. Ovarian hormones, released by the anterior pituitary gland, include follicle-stimulating hormone (FSH) and luteinizing hormone (LH).
 2. The hormones produce changes in the ovaries and in the endometrium.
 3. The menstrual cycle, the regularly recurring physiological changes in the endometrium that culminate in its shedding, may vary in length, with the average length being about 28 days.
- B. Ovarian and uterine phases (see Box 24-1)

IV. Female Pelvis and Measurements

- A. True pelvis
 1. Lies below the pelvic brim
 2. Consists of the pelvic inlet, midpelvis, and pelvic outlet
- B. False pelvis
 1. The shallow portion above the pelvic brim
 2. Supports the abdominal viscera
- C. Types of pelvis
 1. Gynecoid
 - a. Normal female pelvis
 - b. Transversely rounded or blunt

! The gynecoid pelvis is most favorable for successful labor and birth. If cephalopelvic disproportion (CPD) exists, the normal labor process will be delayed and most likely result in a cesarean delivery.

BOX 24-1 Menstrual Cycle**Ovarian Changes****Preovulatory Phase**

Hypothalamus releases gonadotropin-releasing hormone through the portal system to the anterior pituitary system.

Secretion of follicle-stimulating hormone (FSH) by the anterior lobe of the pituitary gland stimulates growth of follicles.

Most follicles die, leaving 1 to mature into a large graafian follicle.

Estrogen produced by the follicle stimulates increased secretions of luteinizing hormone (LH) by the anterior lobe of the pituitary gland.

The follicle ruptures and releases an ovum into the peritoneal cavity.

Luteal Phase

Begins with ovulation.

Body temperature decreases and then increases by 0.5 °F to 1 °F around the time of ovulation.

Corpus luteum is formed from follicle cells that remain in the ovary after ovulation.

Corpus luteum secretes estrogen and progesterone during the remaining 14 days of the cycle.

Corpus luteum degenerates if the ovum is not fertilized, and secretion of estrogen and progesterone declines.

Decline of estrogen and progesterone stimulates the anterior pituitary to secrete more FSH and LH, initiating a new reproductive cycle.

Uterine Changes**Menstrual Phase**

Consists of 4 to 6 days of bleeding as the endometrium breaks down because of the decreased levels of estrogen and progesterone.

The level of FSH increases, enabling the beginning of a new cycle.

Proliferative Phase

Lasts about 9 days.

Estrogen stimulates proliferation and growth of the endometrium.

As estrogen increases, it suppresses secretion of FSH and increases secretion of LH.

Secretion of LH stimulates ovulation and the development of the corpus luteum.

Ovulation occurs between days 12 and 16.

Estrogen level is high, and progesterone level is low.

Secretory Phase

Lasts about 12 days and follows ovulation.

This phase is initiated in response to the increase in LH level. The graafian follicle is replaced by the corpus luteum.

The corpus luteum secretes progesterone and estrogen.

Progesterone prepares the endometrium for pregnancy if a fertilized ovum is implanted.

2. Anthropoid
 - a. Oval shape
 - b. Adequate outlet, with a narrow pubic arch
 3. Android
 - a. Heart-shaped or angulated
 - b. Resembles a male pelvis
 - c. Not favorable for labor and vaginal birth
 - d. Narrow pelvic planes can cause slow descent and midpelvic arrest.
 4. Platypelloid
 - a. Flat with an oval inlet
 - b. Wide transverse diameter, but short anteroposterior diameter, making labor and vaginal birth difficult
- D. Pelvic inlet diameters
1. Anteroposterior diameters
 - a. Diagonal conjugate: Distance from the lower margin of the symphysis pubis to the sacral promontory
 - b. True conjugate or conjugate vera: Distance from the upper margin of the symphysis pubis to the sacral promontory
 - c. Obstetric conjugate: Extends from the sacral promontory to the top of the symphysis pubis. It is the smallest front-to-back distance through which the fetal head must pass in moving through the pelvic inlet.
 2. Transverse diameter: The largest of the pelvic inlet diameters; located at right angles to the true conjugate
 3. Oblique (diagonal) diameter: Not clinically measurable
 4. Posterior sagittal diameter: Distance from the point where the anteroposterior and transverse diameters cross each other to the middle of the sacral promontory
- E. Pelvic midplane diameters
1. Transverse (interspinous diameter)
 2. Midplane normally is the largest plane and has the longest diameter.
- F. Pelvic outlet diameters
1. Transverse (intertuberous diameter)
 2. Outlet presents the smallest plane of the pelvic canal.
- V. Fertilization and Implantation
- A. Fertilization
1. Fertilization occurs in the ampulla of the fallopian (uterine) tube when sperm and ovum unite.
 2. When fertilized, the membrane of the ovum undergoes changes that prevent entry of other sperm.
 3. Each reproductive cell carries 23 chromosomes.
 4. Sperm carry an X or a Y chromosome—XY, male; XX, female.
- B. Implantation
1. The zygote is propelled toward the uterus and implants 6 to 8 days after ovulation.

- The blastocyst secretes chorionic gonadotropin to ensure that the corpus luteum remains viable and secretes estrogen and progesterone for the first 2 to 3 months of gestation.

VI. Fetal Development (Box 24-2)

BOX 24-2 Fetal Development

Preembryonic Period

First 2 weeks after conception

Embryonic Period

Beginning day 15 through approximately week 8 after conception

Fetal Period

Week 9 after conception to birth

Week 1

Blastocyst is free-floating.

Weeks 2 to 3

Embryo is 1.5 to 2 mm in length.
Lung buds appear.
Blood circulation begins.
Heart is tubular and begins to beat.
Neural plate becomes brain and spinal cord.

Week 5

Embryo is 0.4 to 0.5 cm in length.
Embryo is 0.4 g.
Double heart chambers are visible.
Heart is beating.
Limb buds form.

Week 8

Embryo is 3 cm in length.
Embryo is 2 g.
Eyelids begin to fuse.
Circulatory system through umbilical cord is well established.
Every organ system is present.

Week 12

Fetus is 6 to 9 cm in length.
Fetus is 19 g.
Face is well formed.
Limbs are long and slender.
Kidneys begin to form urine.
Spontaneous movements occur.
Heartbeat is detected by Doppler transducer between 10 and 12 weeks.
Sex of fetus is visually recognizable.

Week 16

Fetus is 11.5 to 13.5 cm in length.
Fetus is 100 g.
Active movements are present.
Fetal skin is transparent.
Lanugo hair begins to develop.
Skeletal ossification occurs.

VII. Fetal Environment

A. Amnion

- Encloses the amniotic cavity
- Is the inner membrane that forms about the second week of embryonic development
- Forms a fluid-filled sac that surrounds the embryo and later the fetus

Week 20

Fetus is 16 to 18.5 cm in length.
Fetus is 300 g.
Lanugo covers the entire body.
Fetus has nails.
Muscles are developed.
Enamel and dentin are depositing.
Heartbeat is detected by regular (nonelectronic) fetoscope.

Week 24

Fetus is 23 cm in length.
Fetus is 600 g.
Hair on head is well formed.
Skin is reddish and wrinkled.
Reflex hand grasp functions are present.
Vernix caseosa covers entire body.
Fetus has ability to hear.

Week 28

Fetus is 27 cm in length.
Fetus is 1100 g.
Limbs are well flexed.
Brain is developing rapidly.
Eyelids open and close.
Lungs are developed sufficiently to provide gas exchange (lecithin forming).
If born, neonate can breathe at this time.

Week 32

Fetus is 31 cm in length.
Fetus is 1800 to 2100 g.
Bones are fully developed.
Subcutaneous fat has collected.
Lecithin-to-sphingomyelin (L/S) ratio is 1.2:1.

Week 36

Fetus is 35 cm in length.
Fetus is 2200 to 2900 g.
Skin is pink and body is rounded.
Skin is less wrinkled.
Lanugo is disappearing.
L/S ratio is greater than 2:1.

Week 40

Fetus is 40 cm in length.
Fetus is more than 3200 g.
Skin is pinkish and smooth.
Lanugo is present on upper arms and shoulders.
Vernix caseosa decreases.
Fingernails extend beyond fingertips.
Sole (plantar) creases run down to the heel.
Testes are in the scrotum.
Labia majora are well developed.

B. Chorion

1. Is the outer membrane enclosing the amniotic cavity
2. Becomes vascularized and forms the fetal part of the placenta

C. Amniotic fluid

1. Consists of 800 to 1200 mL by the end of pregnancy
2. Surrounds, cushions, and protects the fetus and allows for fetal movement
3. Maintains the body temperature of the fetus
4. Contains fetal urine and is a measure of fetal kidney function
5. The fetus modifies the amniotic fluid through the processes of swallowing, urinating, and movement of fluid through the respiratory tract.

D. Placenta

1. The **placenta** provides for exchange of nutrients and waste products between the fetus and mother.
2. The placenta begins to form at implantation; the structure is complete by week 12.
3. It produces hormones to maintain pregnancy and assumes full responsibility for the production of these hormones by the twelfth week of gestation.
4. In the third trimester, transfer of maternal immunoglobulin provides the fetus with passive

immunity to certain diseases for the first few months after birth.

5. By week 10 to 12, genetic testing can be done via chorionic villus sampling (CVS).

! Large particles such as bacteria cannot pass through the placenta, but nutrients, medications, alcohol, antibodies, and viruses can pass through the placenta.

VIII. Fetal Circulation

A. Umbilical cord

1. It contains 2 arteries and 1 vein.
2. The arteries carry deoxygenated blood and waste products from the fetus.
3. The vein carries oxygenated blood and provides oxygen and nutrients to the fetus.

B. Fetal heart rate (FHR)

1. FHR depends on gestational age; FHR is 160 to 170 beats/minute in the first trimester, but slows with fetal growth to 110 to 160 beats/minute near or at term.
2. FHR is about twice the maternal heart rate.

C. Fetal circulation bypass (Fig. 24-1)

1. Fetal circulation bypass is present because of nonfunctioning lungs.

FIGURE 24-1 Fetal circulation. Three shunts (ductus venosus, ductus arteriosus, and foramen ovale) allow most blood from the placenta to bypass the fetal lungs and liver.

2. Bypasses must close after birth to allow blood to flow through the lungs and the liver.
3. The ductus arteriosus connects the pulmonary artery to the aorta, bypassing the lungs.
4. The ductus venosus connects the umbilical vein and the inferior vena cava, bypassing the liver.
5. The foramen ovale is the opening between the right and left atria of the heart, bypassing the lungs.

IX. Family Planning

A. Description

1. Involves choosing when to have children
2. Includes contraception, prevention of pregnancy, and methods to achieve pregnancy

B. Birth control

1. The focus of counseling on contraception must meet the needs and feelings of the woman and her partner.
2. Several factors should be considered when choosing a method of birth control, including effectiveness, safety, and personal preference.
3. The woman's preferences are most important, and cultural practices and beliefs and religious or other personal beliefs may affect the choice of contraceptives.
4. Other factors that bear on selection of a contraceptive method include family planning goals, age, frequency of intercourse, and the individual's capacity for compliance.
5. If family planning goals have already been met, sterilization of either the male or the female partner may be desirable (it is important for the couple to understand that tubal reconstruction may be unsuccessful).
6. For women who frequently engage in coitus, oral contraceptives or a long-term method such as implants or an intrauterine device (IUD) may be considered.
7. When sexual activity is limited, use of spermicide, condoms, or a diaphragm may be most appropriate.
8. Because some methods have adverse effects, a signed informed consent form may be needed.
9. For additional information on the use of contraceptives, see Chapter 51.

C. Infertility

1. Infertility is the involuntary inability to conceive when desired.
2. Some factors contributing to infertility in men include abnormalities of the sperm, abnormal erections or ejaculations, or abnormalities of the seminal fluid.
3. Some factors that contribute to infertility in women include disorders of ovulation or abnormalities of the fallopian tubes or cervix.
4. Several diagnostic tests are available to determine the probable cause of infertility, and the therapy

recommended may depend on the cause of the infertility.

5. Infertility options
 - a. Options include medication, surgical procedures, and therapeutic insemination.
 - b. Other therapies are available, such as in vitro fertilization, surrogate mothers, and embryo hosts.
 - c. Adoption may also be an option.
6. The nurse needs to provide support to the couple in their decision-making process and during therapy.

CRITICAL THINKING What Should You Do?

Answer: Adolescent pregnancies are considered high risk due to the immaturity of the reproductive system, as well as the high-risk behaviors that some adolescents engage in. The nurse should provide information to the adolescent regarding the risks associated with drug and alcohol consumption during pregnancy. The nurse should explain to the adolescent that large particles such as bacteria cannot pass through the placenta, but nutrients, medications, alcohol, antibodies, and viruses can pass through; therefore, measures should be taken to minimize exposure to substances that can cross the placental barrier and affect the health of the fetus. Follow-up regarding this high-risk behavior is also necessary.

Reference: Lowdermilk, Perry, Cashion, Alden (2016), pp. 326, 332–333.

PRACTICE QUESTIONS

- ❖ 234. The nurse is preparing to teach a prenatal class about fetal circulation. Which statements should be included in the teaching plan? Select all that apply.
1. “The ductus arteriosus allows blood to bypass the fetal lungs.”
 2. “One vein carries oxygenated blood from the placenta to the fetus.”
 3. “The normal fetal heart tone range is 140 to 160 beats per minute in early pregnancy.”
 4. “Two arteries carry deoxygenated blood and waste products away from the fetus to the placenta.”
 5. “Two veins carry blood that is high in carbon dioxide and other waste products away from the fetus to the placenta.”
235. The nursing instructor asks the student to describe fetal circulation, specifically the ductus venosus. Which statement by the student indicates an understanding of the ductus venosus?
1. “It connects the pulmonary artery to the aorta.”
 2. “It is an opening between the right and left atria.”

3. "It connects the umbilical vein to the inferior vena cava."
4. "It connects the umbilical artery to the inferior vena cava."
236. A pregnant client tells the clinic nurse that she wants to know the sex of her baby as soon as it can be determined. The nurse informs the client that she should be able to find out the sex at 12 weeks' gestation because of which factor?
1. The appearance of the fetal external genitalia
 2. The beginning of differentiation in the fetal groin
 3. The fetal testes are descended into the scrotal sac
 4. The internal differences in males and females become apparent
237. The nurse is performing an assessment on a client who is at 38 weeks' gestation and notes that the fetal heart rate (FHR) is 174 beats/minute. On the basis of this finding, what is the priority nursing action?
1. Document the finding.
 2. Check the mother's heart rate.
 3. Notify the health care provider (HCP).
 4. Tell the client that the fetal heart rate is normal.
238. The nurse is conducting a prenatal class on the female reproductive system. When a client in the class asks why the fertilized ovum stays in the fallopian tube for 3 days, what is the nurse's best response?
1. "It promotes the fertilized ovum's chances of survival."
 2. "It promotes the fertilized ovum's exposure to estrogen and progesterone."
 3. "It promotes the fertilized ovum's normal implantation in the top portion of the uterus."
 4. "It promotes the fertilized ovum's exposure to luteinizing hormone and follicle-stimulating hormone."
- ❖ 239. The nursing instructor asks a nursing student to explain the characteristics of the amniotic fluid. The student responds correctly by explaining which as characteristics of amniotic fluid? Select all that apply.
- 1. Allows for fetal movement
 - 2. Surrounds, cushions, and protects the fetus
 - 3. Maintains the body temperature of the fetus
 - 4. Can be used to measure fetal kidney function
 - 5. Prevents large particles such as bacteria from passing to the fetus
 - 6. Provides an exchange of nutrients and waste products between the mother and the fetus
240. A couple comes to the family planning clinic and asks about sterilization procedures. Which question by the nurse should determine whether this method of family planning would be most appropriate?
1. "Did you ever had surgery?"
 2. "Do you plan to have any other children?"
 3. "Do either of you have diabetes mellitus?"
 4. "Do either of you have problems with high blood pressure?"
241. The nurse should make which statement to a pregnant client found to have a gynecoid pelvis?
1. "Your type of pelvis has a narrow pubic arch."
 2. "Your type of pelvis is the most favorable for labor and birth."
 3. "Your type of pelvis is a wide pelvis, but it has a short diameter."
 4. "You will need a cesarean section because this type of pelvis is not favorable for a vaginal delivery."
- ❖ 242. Which purposes of placental functioning should the nurse include in a prenatal class? Select all that apply.
- 1. It cushions and protects the baby.
 - 2. It maintains the temperature of the baby.
 - 3. It is the way the baby gets food and oxygen.
 - 4. It prevents all antibodies and viruses from passing to the baby.
 - 5. It provides an exchange of nutrients and waste products between the mother and developing fetus.
243. A 55-year-old male client confides in the nurse that he is concerned about his sexual function. What is the nurse's best response?
1. "How often do you have sexual relations?"
 2. "Please share with me more about your concerns."
 3. "You are still young and have nothing to be concerned about."
 4. "You should not have a decline in testosterone until you are in your 80s."

ANSWERS

❖ 234. 1, 2, 4

Rationale: The ductus arteriosus is a unique fetal circulation structure that allows the nonfunctioning lungs to receive only a minimal amount of oxygenated blood for tissue maintenance. Oxygenated blood is transported to the fetus by one umbilical vein. The normal fetal heart tone range is considered to be 110 to 160 beats per minute. Arteries carry deoxygenated blood and waste products from the fetus, and the umbilical vein carries oxygenated blood and provides oxygen and nutrients to the fetus. Blood pumped by the embryo's heart leaves the embryo through two umbilical arteries.

Test-Taking Strategy: Focus on the **subject**, fetal circulation. Recall that three umbilical vessels are within the umbilical cord (two arteries and one vein) and that the vein carries oxygenated blood and the arteries carry deoxygenated blood.

Review: **Fetal circulation**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Maternity—Antepartum

Priority Concepts: Client Education; Perfusion

Reference: Lowdermilk et al. (2016), pp. 273-274.

235. 3

Rationale: The ductus venosus connects the umbilical vein to the inferior vena cava. The foramen ovale is a temporary opening between the right and left atria. The ductus arteriosus joins the aorta and the pulmonary artery.

Test-Taking Strategy: Focus on the **subject**, the description of the ductus venosus. Note the relationship of the word venosus in the question and vein in the correct option.

Review: **Fetal circulation**

Level of Cognitive Ability: Evaluation

Client Needs: Physiological Integrity

Integrated Process: Nursing Process/Evaluation

Content Area: Maternity—Antepartum

Priority Concepts: Perfusion; Reproduction

Reference: Lowdermilk et al. (2016), p. 273.

236. 1

Rationale: By the end of the twelfth week, the external genitalia of the fetus have developed to such a degree that the sex of the fetus can be determined visually. Differentiation of the external genitalia occurs at the end of the ninth week. Testes descend into the scrotal sac at the end of the thirty-eighth week. Internal differences in the male and female occur at the end of the seventh week.

Test-Taking Strategy: Focus on the **subject**, sex of the fetus. Remember that the sex of the fetus can be recognizable visually by the appearance of the external genitalia by gestational week 12.

Review: **Fetal development**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Maternity—Antepartum

Priority Concepts: Development; Sexuality

Reference: Lowdermilk et al. (2016), p. 278.

237. 3

Rationale: The FHR depends on gestational age and ranges from 160 to 170 beats/minute in the first trimester, but slows with fetal growth to 110 to 160 beats/minute near or at term. At or near term, if the FHR is less than 110 beats/minute or more than 160 beats/minute with the uterus at rest, the fetus may be in distress. Because the FHR is increased from the reference range, the nurse should notify the HCP. Options 2 and 4 are inappropriate actions based on the information in the question. Although the nurse documents the findings, based on the information in the question, the HCP needs to be notified. Test-Taking Strategy: Note the **strategic word**, priority. Then, **note if an abnormality exists**. Also note the FHR and that the client is at 38 weeks of gestation. Remember that the normal FHR at or near term is 110 to 160 beats/minute.

Review: Normal **fetal heart rate**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Antepartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), p. 417.

238. 3

Rationale: The tubal isthmus remains contracted until 3 days after conception to allow the fertilized ovum to develop within the tube. This initial growth of the fertilized ovum promotes its normal implantation in the fundal portion of the uterine corpus. Estrogen is a hormone produced by the ovarian follicles, corpus luteum, adrenal cortex, and placenta during pregnancy. Progesterone is a hormone secreted by the corpus luteum of the ovary, adrenal glands, and placenta during pregnancy. Luteinizing hormone and follicle-stimulating hormone are excreted by the anterior pituitary gland. The survival of the fertilized ovum does not depend on it staying in the fallopian tube for 3 days. Test-Taking Strategy: Note the **strategic word**, best, and use knowledge of the anatomy and physiology of the female reproductive system. Remember that fertilization occurs in the fallopian tube and the fertilized ovum remains in the fallopian tube for about 3 days. This promotes its normal implantation.

Review: Anatomy and physiology of the **reproductive system**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Maternity—Antepartum

Priority Concepts: Development; Reproduction

Reference: Lowdermilk et al. (2016), pp. 266-267.

❖ 239. 1, 2, 3, 4

Rationale: The amniotic fluid surrounds, cushions, and protects the fetus. It allows the fetus to move freely and maintains the body temperature of the fetus. In addition, the amniotic fluid contains urine from the fetus and can be used to assess fetal kidney function. The placenta prevents large particles such as bacteria from passing to the fetus and provides an exchange of nutrients and waste products between the mother and the fetus. Test-Taking Strategy: Focus on the **subject**, the characteristics of amniotic fluid. Visualizing the location of the amniotic fluid will assist in answering this question.

Review: Characteristics of the **amniotic fluid**
 Level of Cognitive Ability: Evaluating
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process/Evaluation
 Content Area: Maternity—Antepartum
 Priority Concepts: Client Education; Reproduction
 Reference: Lowdermilk et al. (2016), p. 270.

240. 2

Rationale: Sterilization is a method of contraception for couples who have completed their families. It should be considered a permanent end to fertility because reversal surgery is not always successful. The nurse would ask the couple about their plans for having children in the future. Options 1, 3, and 4 are unrelated to this procedure.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **subject**, sterilization procedure. Noting the relationship between the word sterilization and the words plan to have any other children in the correct option.

Review: Effects of **sterilization**
 Level of Cognitive Ability: Applying
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Antepartum
 Priority Concepts: Health Promotion; Reproduction
 Reference: Lowdermilk et al. (2016), pp. 189-190.

241. 2

Rationale: A gynecoid pelvis is a normal female pelvis and is the most favorable for successful labor and birth. An android pelvis (resembling a male pelvis) would be unfavorable for labor because of the narrow pelvic planes. An anthropoid pelvis has an outlet that is adequate, with a normal or moderately narrow pubic arch. A platypelloid pelvis (flat pelvis) has a wide transverse diameter, but the anteroposterior diameter is short, making the outlet inadequate.

Test-Taking Strategy: Focus on the **subject**, female pelvis types. Recalling that the gynecoid pelvis is the normal female pelvis will direct you to the correct option.

Review: **Female pelvic types**
 Level of Cognitive Ability: Applying
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Teaching and Learning

Content Area: Maternity—Antepartum
 Priority Concepts: Health Promotion; Reproduction
 Reference: Lowdermilk et al. (2016), p. 371.

❖ 242. 3, 5

Rationale: The placenta provides an exchange of oxygen, nutrients, and waste products between the mother and the fetus. The amniotic fluid surrounds, cushions, and protects the fetus and maintains the body temperature of the fetus. Nutrients, medications, antibodies, and viruses can pass through the placenta.
 Test-Taking Strategy: Focus on the **subject**, the purpose of the placenta. Remember that the placenta provides oxygen and nutrients.

Review: Structure and function of the **placenta** and **amniotic fluid**

Level of Cognitive Ability: Applying
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Teaching and Learning
 Content Area: Maternity—Antepartum
 Priority Concepts: Development; Reproduction

243. 2

Rationale: The nurse needs to establish trust when discussing sexual relationships with men. The nurse should open the conversation with broad statements to determine the true nature of the client's concerns. The frequency of intercourse is not a relevant first question to establish trust. Testosterone declines with the aging process.

Test-Taking Strategy: Note the **strategic word**, best. Determine whether further assessment or validation is needed. In this case, more information is needed to determine the nature of the client's concerns. Keeping these concepts in mind and using **therapeutic communication techniques** will assist in directing you to the correct option.

Review: **Sexual function** in the male client
 Level of Cognitive Ability: Applying
 Client Needs: Psychosocial Integrity
 Integrated Process: Caring

Prenatal Period

PRIORITY CONCEPTS Development, Reproduction

CRITICAL THINKING What Should You Do?

The pregnant client at 8 weeks of gestation tells the nurse that she is experiencing morning sickness upon awakening. By lunchtime, she no longer has issues with nausea and vomiting. What should the nurse instruct the client to do to assist in relief of this common morning discomfort? Answer located on p. 310.

I. Gestation

- A. Time from **fertilization** of the ovum until the estimated date of **delivery**
- B. About 280 days
- C. **Nägele's rule** for estimating the date of delivery, also known as date of birth (**Box 25-1**)
 1. Use of Nägele's rule requires that the woman have a regular 28-day menstrual cycle.
 2. Subtract 3 months and add 7 days to the first day of the last menstrual period; then add 1 year if appropriate. Alternatively, add 7 days to the last menstrual period and count forward 9 months.

II. Gravidity and Parity

- A. Gravidity
 1. **Gravida** refers to a pregnant woman.
 2. Gravidity refers to the number of pregnancies.
 3. A nulligravida is a woman who has never been pregnant.
 4. A primigravida is a woman who is pregnant for the first time.
 5. A multigravida is a woman in at least her second pregnancy.
- B. Parity
 1. **Parity** is the number of births (not the number of fetuses, e.g., twins) carried past 20 weeks of gestation, whether or not the fetus was born alive.
 2. A nullipara is a woman who has not had a birth at more than 20 weeks of gestation.

3. A primipara is a woman who has had 1 birth that occurred after the twentieth week of gestation.
4. A multipara is a woman who has had 2 or more pregnancies to the stage of fetal viability.
- C. Use of GTPAL: Pregnancy outcomes can be described with the acronym GTPAL (**Box 25-2**).
 1. G is gravidity, the number of pregnancies, including the present one.
 2. T is term births, the number born at term (longer than 37 weeks of gestation).
 3. P is preterm births, the number born before 37 weeks of gestation.
 4. A is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks of gestation; included in parity if past 20 weeks of gestation). A termination of the pregnancy after 20 weeks is referred to as a "therapeutic termination."
 5. L is the number of current living children.

III. Pregnancy Signs

- A. Presumptive signs
 1. Amenorrhea
 2. Nausea and vomiting
 3. Increased size and increased feeling of fullness in breasts
 4. Pronounced nipples
 5. Urinary frequency
 6. **Quickening**: The first perception of fetal movement by the mother may occur at the sixteenth to twentieth week of gestation.
 7. Fatigue
 8. Discoloration of the vaginal mucosa
- B. Probable signs
 1. Uterine enlargement
 2. **Hegar's sign**: Compressibility and softening of the lower uterine segment that occurs at about week 6
 3. **Goodell's sign**: Softening of the cervix that occurs at the beginning of the second month

BOX 25-1 Nägele's Rule for Estimating the Date of Delivery

First day of last menstrual period: September 12, 2018
 Subtract 3 months: June 12, 2018
 Add 7 days: June 19, 2018
 Add 1 year: June 19, 2019
 Estimated date of delivery: June 19, 2019

BOX 25-2 Describing Pregnancy Outcome with GTPAL

G¼ Gravidity
 T¼ Term births
 P¼ Preterm births
 A¼ Abortions or miscarriages
 L¼ Current living children

Example: A woman is pregnant for the fourth time. She had 1 elective abortion in the first trimester, a daughter who was born at 40 weeks of gestation, and a son who was born at 36 weeks of gestation. She is gravida (G), 4; term (T), 1 (the daughter born at 40 weeks); preterm (P), 1 (the son born at 36 weeks); abortion (A), 1 (the abortion is counted in the gravidity, but is not included in the parity because it occurred before 20 weeks); living children (L), 2. Parity is the number of births (not the number of fetuses) carried past 20 weeks of gestation, whether or not the fetus was born alive. Therefore, the parity for this woman is 2.

GTPAL¼ 4, 1, 1, 1, 2

4. **Chadwick's sign:** Violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about week 6
 5. **Ballottement:** Rebounding of the fetus against the examiner's fingers on palpation
 6. Braxton Hicks contractions (irregular painless contractions that may occur intermittently throughout pregnancy)
 7. Positive pregnancy test for determination of the presence of human chorionic gonadotropin
- C. Positive signs (diagnostic)
1. Fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation
 2. Active fetal movements palpable by examiner
 3. Outline of fetus via radiography or ultrasonography

IV. Fundal Height (Box 25-3)

- A. Fundal height is measured to evaluate the gestational age of the fetus.
- B. During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals fetal age in weeks \pm 2 cm (Fig. 25-1).

BOX 25-3 Measuring Fundal Height

1. Place the client in the supine position.
2. Place the end of the tape measure at the level of the symphysis pubis.
3. Stretch the tape to the top of the uterine fundus.
4. Note and record the measurement.

FIGURE 25-1 Height of fundus by weeks of normal gestation with a single fetus. Dashed line, Height after lightening (descent of the fetus toward the pelvic inlet before labor).

- C. At 16 weeks, the fundus can be found approximately halfway between the symphysis pubis and the umbilicus.
- D. At 20 to 22 weeks, the fundus is approximately at the location of the umbilicus.
- E. At 36 weeks, the fundus is at the xiphoid process.

! When assessing fundal height, monitor the client closely for supine hypotension when placed in the supine position.

V. Physiological Maternal Changes

! Culture often determines health beliefs, values, and family expectations. Therefore, it is important to assess cultural beliefs during care of the maternity client.

- A. Cardiovascular system
 1. Circulating blood volume increases, plasma increases, and total red blood cell volume increases (total volume increases by approximately 40% to 50%).

FIGURE 25-2 Changes in position of heart, lungs, and thoracic cage in pregnancy. Broken line, Nonpregnant state. Solid line, Change that occurs in pregnancy.

2. Physiological anemia occurs as the plasma increase exceeds the increase in production of red blood cells.
3. Iron requirements are increased.
4. Heart size increases, and the heart is elevated slightly upward and to the left because of displacement of the diaphragm as the **uterus** enlarges (Fig. 25-2).
5. Retention of sodium and water may occur.

B. Respiratory system

1. Oxygen consumption increases by approximately 15% to 20%.
2. Diaphragm is elevated because of the enlarged uterus (see Fig. 25-2).
3. Shortness of breath may be experienced.

! During pregnancy, a woman's pulse rate may increase about 10 to 15 beats/minute; the blood pressure slightly decreases in the second trimester, then increases in the third trimester, but not above the pre-pregnancy level; and the respiratory rate remains unchanged or slightly increases.

C. Gastrointestinal system

1. Nausea and vomiting may occur as a result of the secretion of human chorionic gonadotropin; it typically subsides by the third month.
2. Poor appetite may occur because of decreased gastric motility.
3. Alterations in taste and smell may occur.
4. Constipation may occur because of an increase in progesterone production or pressure of the uterus resulting in decreased gastrointestinal motility.

5. Flatulence and heartburn may occur because of decreased gastrointestinal motility and slowed emptying of the stomach caused by an increase in progesterone production.
6. Hemorrhoids may occur because of increased venous pressure.
7. Gum tissue may become swollen and easily bleed because of increasing levels of estrogen.
8. Ptyalism (excessive secretion of saliva) may occur because of increasing levels of estrogen.

D. Renal system

1. Frequency of urination increases in the first and third trimesters because of increased bladder sensitivity and pressure of the enlarging uterus on the bladder.
2. Decreased bladder tone may occur and is caused by an increase in progesterone and estrogen levels; bladder capacity increases in response to increasing levels of progesterone.
3. Renal threshold for glucose may be reduced.

E. Endocrine system

1. Basal metabolic rate increases and metabolic function increases.
2. The anterior lobe of the pituitary gland enlarges and produces serum prolactin needed for the lactation process.
3. The posterior lobe of the pituitary gland produces oxytocin, which stimulates uterine contractions.
4. The thyroid enlarges slightly, and thyroid activity increases.
5. The parathyroid increases in size.
6. Aldosterone levels gradually increase.
7. Body weight increases.
8. Water retention is increased, which can contribute to weight gain.

F. Reproductive system

1. **Uterus**
 - a. Uterus enlarges, increasing in mass from approximately 60 to 1000 g as a result of hyperplasia (influence of estrogen) and hypertrophy.
 - b. Size and number of blood vessels and lymphatics increase.
 - c. Irregular contractions occur, typically beginning after 16 weeks of gestation.
2. **Cervix**
 - a. Cervix becomes shorter, more elastic, and larger in diameter.
 - b. Endocervical glands secrete a thick mucous plug, which is expelled from the canal when dilation begins.
 - c. Increased vascularization and an increase in estrogen cause softening and a violet discoloration known as **Chadwick's sign**, which occurs at about 6 weeks of gestation.

3. Ovaries
 - a. A major function of the ovaries is to secrete progesterone for the first 6 to 7 weeks of pregnancy.
 - b. The maturation of new follicles is blocked.
 - c. The ovaries cease ovum production.

4. Vagina

- a. Hypertrophy and thickening of the muscle occur.
 - b. An increase in vaginal secretions is experienced; secretions are usually thick, white, and acidic.
5. Breasts: Breast changes occur because of the increasing effects of estrogen and progesterone.
 - a. Breast size increases, and breasts may be tender.
 - b. Nipples become more pronounced.
 - c. The areolae become darker in color.
 - d. Superficial veins become prominent.
 - e. Hypertrophy of Montgomery's follicles occurs.
 - f. Colostrum may leak from the breast.

G. Skin

1. Some changes occur because the levels of melanocyte-stimulating hormone increase as a result of an increase in estrogen and progesterone levels; these changes include the following:
 - a. Increased pigmentation
 - b. Dark streak down the midline of the abdomen (linea nigra)
 - c. Chloasma (mask of pregnancy)—a blotchy brownish hyperpigmentation, over the forehead, cheeks, and nose
 - d. Reddish purple stretch marks (striae gravidarum) on the abdomen, breasts, thighs, and upper arms
2. Vascular spider nevi may occur on the neck, chest, face, arms, and legs.
3. Rate of hair growth may increase.

H. Musculoskeletal system

1. Changes in the center of gravity begin in the second trimester and are caused by the hormones relaxin and progesterone.
2. The lumbrosacral curve increases.
3. Aching, numbness, and weakness may result; walking becomes more difficult, and the woman develops a waddling gait and is at risk for falls.
4. Relaxation and increased mobility of pelvic joints occur, which permit enlargement of pelvic dimensions.
5. Abdominal wall stretches with loss of tone throughout pregnancy, regained postpartum.
6. Umbilicus flattens or protrudes.

 During pregnancy, postural changes occur as the increased weight of the uterus causes a forward pull of the bony pelvis. It is important for the nurse to encourage the client to implement measures that maintain safety and correct posture to prevent a backache.

VI. Psychological Maternal Changes

A. Ambivalence

1. Ambivalence occurs early in pregnancy, even when the pregnancy is planned.
2. The mother may experience a dependence-independence conflict and ambivalence related to role changes.
3. The partner may experience ambivalence related to the new role being assumed, increased financial responsibilities, and sharing the mother's attention with the child.

B. Acceptance: Factors that may be related to acceptance of the pregnancy are the woman's readiness for the experience and her identification with the motherhood role. Specific developmental tasks must be accomplished successfully for positive maternal role adaptation. These tasks include accepting the pregnancy, identifying with the mothering role, solidifying her relationship with her partner, establishing a relationship with her unborn infant, and preparing for her birth experience.

C. Emotional lability

1. Emotional lability may be manifested by frequent changes of emotional states or extremes in emotional states.
2. These emotional changes are common, but the mother may think that these changes are abnormal.

D. Body image changes

1. The changes in a woman's perception of her image during pregnancy occur gradually and may be positive or negative.
2. The physical changes and signs and symptoms that the woman experiences during pregnancy contribute to her body image.

E. Relationship with the fetus

1. The woman may daydream to prepare for motherhood and think about the maternal qualities that she would like to possess.
2. The woman first accepts the biological fact that she is pregnant.
3. The woman next accepts the growing fetus as distinct from herself and a person to nurture.
4. Finally, the woman prepares realistically for the birth and parenting of the child.

VII. Discomforts of Pregnancy

A. Nausea and vomiting

1. Occurs in the first trimester and usually subsides by the third month
2. Caused by elevated levels of human chorionic gonadotropin and other pregnancy hormones as well as changes in carbohydrate metabolism
3. Interventions
 - a. Eating dry crackers before arising
 - b. Avoiding brushing teeth immediately after arising

- c. Eating small, frequent, low-fat meals during the day
 - d. Drinking liquids between meals rather than at meals
 - e. Avoiding fried foods and spicy foods
 - f. Asking the health care provider (HCP) about acupressure (some types may require a prescription)
 - g. Asking the HCP about the use of herbal remedies
 - h. Taking antiemetic medications as prescribed
- B. Syncope**
1. Usually occurs in the first trimester; supine hypotension occurs particularly in the second and third trimesters.
 2. May be triggered hormonally or caused by the increased blood volume, anemia, fatigue, sudden position changes, or lying supine
 3. Interventions
 - a. Sitting with the feet elevated
 - b. Risk for falls; teach to change positions slowly
-  **The nurse needs to instruct the pregnant woman to avoid lying in the supine position, particularly in the second and third trimesters. The supine position places the woman at risk for supine hypotension, which occurs as a result of pressure of the uterus on the inferior vena cava.**
- C. Urinary urgency and frequency**
1. Usually occurs in the first and third trimesters
 2. Caused by pressure of the uterus on the bladder
 3. Interventions
 - a. Drinking no less than 2000 mL of fluid during the day
 - b. Limiting fluid intake in the evening
 - c. Voiding at regular intervals
 - d. Sleeping side-lying at night
 - e. Wearing perineal pads, if necessary
 - f. Performing Kegel exercises
- D. Breast tenderness**
1. Can occur in the first through the third trimesters
 2. Caused by increased levels of estrogen and progesterone
 3. Interventions
 - a. Wearing a supportive bra
 - b. Avoiding the use of soap on the nipples and areolar area to prevent drying of skin
- E. Increased vaginal discharge**
1. Can occur in the first through the third trimesters
 2. Caused by hypertrophy and thickening of the vaginal mucosa and increased mucus production
 3. Interventions
 - a. Using proper cleansing and hygiene techniques
 - b. Wearing cotton underwear
 - c. Avoiding douching
 - d. Consulting the HCP if infection is suspected
- F. Nasal stuffiness**
1. Occurs in the first through third trimesters
 2. Results from increased estrogen, which causes edema of the nasal tissues and dryness
 3. Interventions
 - a. Encouraging the use of a humidifier
 - b. Avoiding the use of nasal sprays or antihistamines (the HCP should be consulted about their use)
- G. Fatigue**
1. Occurs usually in the first and third trimesters
 2. Usually results from hormonal changes
 3. Interventions
 - a. Arranging frequent rest periods throughout the day
 - b. Using correct posture and body mechanics
 - c. Obtaining regular exercise
 - d. Performing muscle relaxation and strengthening exercises for the legs and hip joints
 - e. Avoiding eating and drinking foods containing stimulants throughout the pregnancy
- H. Heartburn**
1. Occurs in the second and third trimesters
 2. Results from increased progesterone levels, decreased gastrointestinal motility, esophageal reflux, and displacement of the stomach by the enlarging uterus
 3. Interventions
 - a. Eating small, frequent meals
 - b. Sitting upright for 30 minutes after a meal
 - c. Drinking milk between meals
 - d. Avoiding fatty and spicy foods
 - e. Performing tailor-sitting exercises
 - f. Consulting with the HCP about the use of antacids
- I. Ankle edema**
1. Usually occurs in the second and third trimesters
 2. Results from vasodilation, venous stasis, and increased venous pressure below the uterus
 3. Interventions
 - a. Elevating the legs at least twice a day and when resting
 - b. Sleeping in a side-lying position
 - c. Wearing supportive stockings or support hose
 - d. Avoiding sitting or standing in 1 position for long periods
- J. Varicose veins**
1. Usually occur in the second and third trimesters
 2. Result from weakening walls of the veins or valves and venous congestion
 3. Interventions
 - a. Wearing supportive stockings or support hose
 - b. Elevating the feet when sitting
 - c. Lying with the feet and hips elevated
 - d. Avoiding long periods of standing or sitting
 - e. Moving about while standing to improve circulation

- f. Avoiding leg crossing
- g. Avoiding constricting articles of clothing such as knee-high stockings
- 4. Thrombophlebitis is rare, but it may occur.
 - a. Teaching leg exercises
 - b. Avoiding airline travel
- K. Headaches
 - 1. Usually considered benign in the first trimester. May need further investigation if occurring in the second and third trimesters
 - 2. Result from changes in blood volume and vascular tone
 - 3. Interventions
 - a. Changing position slowly
 - b. Applying a cool cloth to the forehead
 - c. Eating a small snack
 - d. Using acetaminophen only if prescribed by the HCP
- L. Hemorrhoids
 - 1. Usually occur in the second and third trimesters
 - 2. Result from increased venous pressure and constipation
 - 3. Interventions
 - a. Soaking in a warm sitz bath
 - b. Sitting on a soft pillow
 - c. Eating high-fiber foods and drinking sufficient fluids to avoid constipation
 - d. Increasing exercise, such as walking
 - e. Applying ointments, suppositories, or compresses as prescribed by the HCP
- M. Constipation
 - 1. Usually occurs in the second and third trimesters
 - 2. Results from an increase in progesterone production, decreased intestinal motility, displacement of the intestines, pressure of the uterus, and taking iron supplements
 - 3. Interventions
 - a. Eating high-fiber foods such as whole grains, fruits, and vegetables
 - b. Drinking no less than 2000 mL per day
 - c. Exercising regularly, such as a daily 20-minute walk
 - d. Consulting with the HCP about interventions such as the use of stool softeners, laxatives, or enemas
- N. Backache
 - 1. Usually occurs in the second and third trimesters
 - 2. Caused by an exaggerated lumbosacral curve resulting from an enlarged uterus
 - 3. Risk for falls; teach to move about slowly
 - 4. Interventions
 - a. Obtaining rest
 - b. Using correct posture and body mechanics
 - c. Wearing low-heeled, comfortable, and supportive shoes
 - d. Performing pelvic tilt (rock) exercises and conscious relaxation exercises
 - e. Sleeping on a firm mattress

- O. Leg cramps
 - 1. Usually occur in the second and third trimesters
 - 2. Result from an altered calcium-phosphorus balance and pressure of the uterus on nerves or from fatigue
 - 3. Interventions
 - a. Getting regular exercise, especially walking
 - b. Dorsiflexing the foot of the affected leg
 - c. Increasing calcium intake
- P. Shortness of breath
 - 1. Can occur in the second and third trimesters
 - 2. Results from pressure on the diaphragm from the enlarged uterus
 - 3. Interventions
 - a. Taking frequent rest periods
 - b. Sitting and sleeping with the head elevated or on the side
 - c. Avoiding overexertion

VIII. Maternal Risk Factors

- A. Maternal age: Women younger than 20 years and older than 35 years are at risk for adverse perinatal outcomes.
- B. Adolescent pregnancy
 - 1. Factors that result in adolescent pregnancy include the early onset of menarche, changing sexual behaviors in this age group, problems with family relationships, poverty, and lack of knowledge of reproduction and birth control.
 - 2. Major concerns related to adolescent pregnancy include poor nutritional status; emotional and behavioral difficulties; lack of support systems; increased risk of stillbirth; low-birth-weight infants; fetal mortality; cephalopelvic disproportion; and increased risk of maternal complications, such as hypertension, anemia, prolonged labor, and infections.
 - 3. The role of the nurse in reducing risks and consequences of adolescent pregnancy is twofold—first, to encourage early and continued prenatal care, and second, to refer the adolescent, if necessary, for appropriate assistance, which can help to counter the effects of a negative socioeconomic environment.
 - a. Nutrition: Adequate nutrition is necessary for normal fetal growth and development. Nutrition needs are determined by the stage of pregnancy and nutrition should support recommended weight gain during the various stages.
 - b. Genetic considerations: Genetic abnormalities such as defective genes or transmissible inherited disorders can result in congenital anomalies; the nurse should perform a

Women of childbearing age should take folic acid supplements to prevent neural tube defects and orofacial clefts in the fetus.

genetic risk assessment to determine an inheritable risk.

- c. Health care: Failure to seek and obtain prenatal care, including dental care, increases the risk for preterm birth and low birth weight.
 - d. Abuse and violence: Physical abuse and violence can increase the risk for abruptio placentae, preterm birth, and infections from unwanted and forced sex.
 - e. Medical conditions: Concurrent medical conditions, such as but not limited to diabetes mellitus, hypertensive disorder, or cardiac disease, increase the risk of pregnancy.
- C. German measles (rubella): Maternal infection during the first 8 weeks of gestation carries the highest rate of fetal infection.
- D. Sexually transmitted infections
- 1. Syphilis
 - a. Organism may cross the **placenta**.
 - b. Infection usually leads to spontaneous abortions and increases the incidence of mental subnormality and physical deformities.
 - 2. Condyloma acuminatum (human papillomavirus)
 - a. Transmission may occur during vaginal birth.
 - b. Infection is associated with the development of epithelial tumors of the mucous membranes of the larynx in children.
 - 3. Gonorrhea
 - a. Fetus is contaminated at the time of birth.
 - b. Maternal infection may result in postpartum infection of the **neonate**.
 - c. Risks to the neonate include ophthalmia neonatorum, pneumonia, and sepsis.
 - 4. Chlamydial infection
 - a. Transmission may occur during vaginal birth and can result in neonatal conjunctivitis or pneumonitis.
 - b. Infection can cause premature rupture of the membranes, premature labor, and postpartum endometritis.
 - 5. Trichomoniasis: Associated with premature rupture of the membranes and postpartum endometritis
 - 6. Genital herpes simplex virus
 - a. Characterized by painful lesions, fever, chills, malaise, and severe dysuria and may last 2 to 3 weeks
 - b. Assessment includes questioning all women about signs and symptoms and inspecting the vulvar, perineal, and vaginal areas for vesicles or areas of ulceration or crusting; this is done during pregnancy and at the onset of labor.
 - c. Vaginal birth may be acceptable; cesarean birth is recommended if visible lesions are present.
 - d. Infants who are born through an infected vagina should be observed carefully, and samples should be taken for culture.

- E. Human immunodeficiency virus (HIV)
 - 1. HIV is transmitted through blood; blood products; and other bodily fluids, such as urine, semen, and vaginal secretions; the virus is also transmitted through exposure to infected secretions during birth and through breast milk.
 - 2. Repeated exposure to the virus during pregnancy through unsafe sex practices or intravenous drug use can increase the risk of transmission to the fetus.
 - 3. Perinatal administration of zidovudine may be recommended to decrease the risk of transmission of HIV from mother to fetus.
- F. Substance abuse
 - 1. Substance abuse threatens normal fetal growth and successful term completion of the pregnancy.
 - 2. Substance abuse places the pregnancy at risk for fetal growth restriction, abruptio placentae, and fetal bradycardia.
 - 3. Many substances cross the placenta and can be teratogenic (drugs, tobacco, alcohol, medications, certain foods such as raw fish); no over-the-counter medications should be taken unless prescribed by the HCP.
 - 4. Smoking (tobacco) can result in low birth weight, a higher incidence of birth defects, and stillbirths.
 - 5. Physical signs of drug abuse may include dilated or contracted pupils, fatigue, track (needle) marks, skin abscesses, inflamed nasal mucosa, and inappropriate behavior by the mother.
 - 6. Consumption of alcohol during pregnancy may lead to fetal alcohol syndrome and can cause jitteriness, physical abnormalities, congenital anomalies, and growth deficits in the **newborn**.
- G. Viral hepatitis (see [Chapter 26](#) and [Chapter 52](#) for information regarding hepatitis B infection)

IX. Antepartum Diagnostic Testing

 The usual schedule for antepartum health care visits is every 4 weeks for the first 28 to 32 weeks, every 2 weeks from 32 to 36 weeks, and every week from 36 to 40 weeks.

- A. Blood type and Rh factor
 - 1. ABO typing is performed to determine the woman's blood type in the ABO antigen system.
 - 2. Rh typing is done to determine the woman's blood type in the rhesus antigen system. (Rh positive indicates the presence of the antigen; Rh negative indicates the absence of the antigen.)
 - 3. If the client is Rh negative and has a negative antibody screen, she will need repeat antibody screens and should receive Rh₀(D) immune globulin (RhoGAM) at 28 weeks of gestation.
- B. Rubella titer
 - 1. If the client has a negative titer (less than 1:8), indicating susceptibility to the rubella virus,

she should receive the appropriate immunization postpartum.

2. The client must be using effective birth control at the time of the immunization and must be counseled not to become pregnant for 1 to 3 months after immunization (as specified by the HCP) and to avoid contact with anyone who is immunocompromised.
3. If the rubella vaccine is administered at the same time as Rh_o(D) immune globulin, it may not be effective.
4. Rubella vaccine is administered postpartum (before discharge) via the subcutaneous route if the titer is less than 1:8; inquire about sensitivity to eggs.

 **Rubella vaccine is not given during pregnancy because the live attenuated virus may cross the placenta and present a risk to the developing fetus.**

C. Hemoglobin and hematocrit levels

1. Hemoglobin and hematocrit levels decline during gestation as a result of increased plasma volume.
2. A decrease in the hemoglobin level to less than 10 g/dL (100 mmol/L) or in the hematocrit level to less than 30% indicates anemia.

D. Papanicolaou's smear is done during the initial prenatal examination to screen for cervical neoplasia.

E. Sexually transmitted infections (Table 25-1)

F. Sickle cell screening

1. Screening is indicated for clients at risk for sickle cell disease.
2. A positive test may indicate a need for further screening.

G. Tuberculin skin test

1. The HCP may prefer to perform this skin test after **birth**.
2. A positive skin test indicates the need for a chest radiograph (using an abdominal lead shield) to rule out active disease; in a pregnant client, chest radiography would not be performed until after 20 weeks of gestation (after the fetal organs are formed).
3. Converters to positive may be referred for treatment with medication after birth.

H. Hepatitis B surface antigens

1. Testing for hepatitis antigens is recommended for all women because of the prevalence of the disease in the general population.
2. Vaccination for hepatitis B antigen may be specifically indicated for the following:
 - a. Health care workers
 - b. Intravenous drug users
 - c. Clients born in Asia, Africa, Haiti, or the Pacific islands
 - d. Clients with previously undiagnosed jaundice or chronic liver disease
 - e. Clients with tattoos
 - f. Clients with histories of blood transfusions
 - g. Clients with histories of multiple episodes of sexually transmitted infections
 - h. Clients who have been rejected previously as blood donors
 - i. Clients with histories of dialysis or renal transplantation
 - j. Clients from households having members infected with hepatitis B or hemodialysis clients

TABLE 25-1 Monitoring for Sexually Transmitted Infections

Disease	Laboratory Test
Gonorrhea	Vaginal culture is done during initial prenatal examination to screen for gonorrhea. Culture may be repeated during third trimester in high-risk clients.
Syphilis	Culture of lesions (if present) is done during initial prenatal examination to screen for syphilis. Diagnosis depends on microscopic examination of primary and secondary lesion tissue and serology (Venereal Disease Research Laboratory [VDRL] or rapid plasma reagin [RPR] test) during latency and late infection. Culture may be repeated during third trimester in high-risk clients.
Condyloma acuminatum (human papillomavirus)	Culture is indicated for clients with positive history or with active lesions. Test is performed to determine route of delivery. Weekly cultures may be done at week 35 or 36 of pregnancy until birth.
Chlamydia	Vaginal culture is indicated for all pregnant clients if client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia.
Trichomoniasis	Normal saline wet smear of vaginal secretions is checked for presence of protozoa. Associated with premature rupture of membranes and postpartum endometritis.
Genital herpes simplex virus (HSV-2)	Culture is done of lesions (if present) during initial prenatal examination to screen for HSV. Microscopic examination is done to determine presence of virus. Additional screening may be necessary as pregnancy progresses.
HIV	Testing may be done for high-risk client. Common tests to determine the presence of antibodies include ELISA, Western blot, and immunofluorescence assay (IFA).

ELISA, Enzyme-linked immunosorbent assay; HIV, human immunodeficiency virus.

3. Hepatitis B vaccine is not contraindicated during pregnancy and may be recommended by the HCP.
 4. See [Chapter 52](#) for additional information about hepatitis.
- I. Urinalysis and urine culture
1. A urine specimen for glucose and protein determinations should be obtained at every antepartum visit.
 2. Glycosuria is a common result of decreased renal threshold that occurs during pregnancy.
 3. If glycosuria persists, it may indicate diabetes.
 4. White blood cells in the urine may indicate infection.
 5. Ketonuria may result from insufficient food intake or vomiting.
 6. Levels of 2+ to 4+ protein in the urine may indicate infection or preeclampsia.
- J. Ultrasonography
1. Outlines and identifies fetal and maternal structures
 2. Assists in confirming gestational age and estimated date of delivery and evaluating **amniotic fluid** volume (amniotic fluid index), which is done via special measurements
 3. May be done abdominally or transvaginally during pregnancy
 4. Can be used to determine the presence of premature dilation of the cervix (incompetent cervix). A transvaginal ultrasound is used during the first trimester to check the length of the cervix.
 5. Interventions
 - a. If an abdominal ultrasound is being performed, the woman may need to drink water to fill the bladder before the procedure to obtain a better image of the fetus.
 - b. If a transvaginal ultrasound is being performed, a lubricated probe is inserted into the **vagina**.
 - c. The client should be informed that the test presents no known risks to the client or the fetus.
- K. Biophysical profile
1. Noninvasive assessment of the fetus that includes fetal breathing movements, fetal movements, fetal tone, amniotic fluid index, and fetal heart rate patterns via a nonstress test
 2. Normal fetal biophysical activities indicate that the central nervous system is functional and that the fetus is not hypoxemic.
- L. Doppler blood flow analysis: Noninvasive (ultrasonography) method of studying the blood flow in the fetus and **placenta**
- M. Percutaneous umbilical blood sampling
1. Percutaneous umbilical blood sampling is performed if fetal blood sampling is necessary; it involves insertion of a needle directly into the fetal umbilical vessel under ultrasound guidance.
 2. Fetal heart rate monitoring is necessary for 1 hour after the procedure, and a follow-up ultrasound to check for bleeding or hematoma formation is done 1 hour after the procedure.
- N. α -Fetoprotein screening
1. Assesses the quantity of fetal serum proteins; abnormal protein levels are associated with open neural tube and abdominal wall defects
 2. Assists in screening for spina bifida and Down syndrome
 3. If abnormal, repeat test; false positive is common.
 4. Interventions
 - a. α -Fetoprotein level is determined by a maternal blood sample drawn between 16 and 18 weeks of gestation.
 - b. If the level is abnormal and the gestation is less than 18 weeks, a second sample is drawn and screened.
 - c. An ultrasound is performed for elevated levels to rule out fetal abnormalities or multiple gestation.
- O. Deoxyribonucleic acid (DNA) genetic testing
1. Can be used to detect abnormalities related to an inherited condition
 2. Assists in determining if the woman is at risk for having a fetus with Down syndrome (trisomy 21), Edwards syndrome (trisomy 18), or Patau syndrome (trisomy 13).
 3. Interventions: This type of testing can be done as early as 7 weeks of gestation and a blood sample is used.
- P. Chorionic villus sampling
1. Performed for the purpose of detecting genetic abnormalities; the HCP aspirates a small sample of chorionic villus tissue at 10 to 13 weeks of gestation.
 2. Interventions
 - a. Ensure informed consent was obtained.
 - b. The client may need to drink water to fill the bladder before the procedure to aid in the visualization of the uterus for catheter insertion.
 - c. Obtain baseline vital signs and fetal heart rate; monitor frequently after the procedure.
 - d. Rh-negative women may be given Rh_o(D) immune globulin because chorionic villus sampling increases the risk of Rh sensitization.
- Q. Amniocentesis
1. Aspiration of amniotic fluid; best performed between 15 and 20 weeks of pregnancy because amniotic fluid volume is adequate and many viable fetal cells are present in the fluid by this time
 2. Performed to determine genetic disorders, metabolic defects, and fetal lung maturity

3. Risks
 - a. Maternal hemorrhage
 - b. Infection
 - c. Rh isoimmunization
 - d. Abruptio placentae
 - e. Amniotic fluid emboli
 - f. Premature rupture of the membranes
4. Interventions
 - a. Ensure informed consent was obtained.
 - b. If less than 20 weeks of gestation, the client should have a full bladder to support the uterus; if performed after 20 weeks of gestation, the client should have an empty bladder to minimize the chance of puncture.
 - c. Prepare the client for ultrasonography, which is performed to locate the placenta and avoid puncture.
 - d. Obtain baseline vital signs and fetal heart rate; monitor every 15 minutes.
 - e. Position the client supine during the examination and on the left side after the procedure.

 After chorionic villus sampling and amniocentesis, instruct the client that if chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping occurs, she must notify the HCP.

- R. Kick counts (fetal movement counting)
 1. The client sits quietly or lies down on her side and counts fetal kicks as instructed.
 2. Instruct the client to notify the HCP if there are fewer than 10 kicks in 2 consecutive 2-hour periods or as instructed by the HCP.
- S. Fern test
 1. The fern test is a microscopic slide test to determine the presence of amniotic fluid leakage.
 2. Using sterile technique, a specimen is obtained from the external os of the cervix and vaginal pool and is examined on a slide under a microscope.
 3. A fernlike pattern produced by the effects of salts of the amniotic fluid indicates the presence of amniotic fluid.
 4. Interventions
 - a. Position the client in the dorsal lithotomy position.
 - b. Instruct the client to cough, which causes the amniotic fluid to leak from the uterus if the membranes are ruptured.
- T. Nitrazine test
 1. A nitrazine test strip is used to detect the presence of amniotic fluid in vaginal secretions.
 2. Vaginal secretions have a pH of 4.5 to 5.5 and do not affect the nitrazine strip or swab.
 3. Amniotic fluid has a pH of 7.0 to 7.5 and turns the nitrazine strip or swab blue.

4. Interventions
 - a. Position the client in the dorsal lithotomy position.
 - b. Touch the test tape to the fluid.
 - c. Assess the test tape for a blue-green, blue-gray, or deep blue color, which indicates that the membranes are ruptured, causing leakage of amniotic fluid.

- U. Fibronectin test
 1. Sampling of cervical and vaginal secretions for fetal fibronectin (a protein present in fetal tissues normally found in cervical and vaginal secretions until 16 to 20 weeks of gestation and again at or near term)
 2. Positive results may indicate the onset of labor in 1 to 3 weeks; negative test results are more predictive that preterm labor will not begin.
 3. Test used if at risk for preterm labor, before 37 weeks of gestation
 4. Interventions
 - a. Client is placed in lithotomy position for sterile speculum exam.
 - b. Cervical secretions are obtained with cotton swab.
 - c. Laboratory tests are done for the presence of fibronectin.
- V. Nonstress test (Box 25-4)
- W. Contraction stress test (Box 25-5)

X. Nutrition

- A. General guidelines
 1. Guidelines for health and nutrition information for breast-feeding and pregnant women are located at the U.S. Department of Agriculture ChooseMyPlate website at www.choosemyplate.gov/moms-pregnancy-breastfeeding. The woman should be assisted with accessing this site and preparing a nutritional plan.
 2. The average expected weight gain during pregnancy is 25 to 35 lb (11 to 16 kg) for women with a normal prepregnancy weight.
 3. An increase of about 300 calories/day is needed during pregnancy.
 4. Calorie needs are greater in the last 2 trimesters than in the first.
 5. An increase of about 500 calories/day is needed during lactation.
 6. A diet high in folic acid or folic acid supplements is necessary for all women of childbearing age to prevent neural tube defects and orofacial clefts in the fetus.
 7. At least 8 to 10 (8-oz) glasses of fluid are needed each day, of which 4 to 6 glasses should be water.
 8. Sodium is not restricted unless specifically prescribed by the HCP.

BOX 25-4 Nonstress Test**Description**

- Test is performed to assess placental function and oxygenation.
- Test determines fetal well-being.
- Test evaluates the fetal heart rate (FHR) response to fetal movement.

Interventions

- An external ultrasound transducer and tocodynamometer are applied to the client, and a tracing of at least 20 minutes' duration is obtained so that the FHR and uterine activity can be observed.
- Baseline blood pressure is obtained, and blood pressure is monitored frequently.
- The client is placed in the lateral (side-lying) position to avoid vena cava compression.
- The client may be asked to press a button every time she feels fetal movement; the monitor records a mark at each point of fetal movement, which is used as a reference point to assess the FHR response.

Results**Reactive Nonstress Test (Normal, Negative)**

“Reactive” indicates a healthy fetus.

The result requires 2 or more FHR accelerations of at least 15 beats/minute, lasting at least 15 seconds from the beginning of the acceleration to the end, in association with fetal movement, during a 20-minute period.

Nonreactive Nonstress Test (Abnormal)

No accelerations or accelerations of less than 15 beats/minute or lasting less than 15 seconds in duration occur during a 40-minute observation.

Unsatisfactory

The result cannot be interpreted because of the poor quality of the FHR tracing.

BOX 25-5 Contraction Stress Test**Description**

- Test assesses placental oxygenation and function.
- Test determines fetal ability to tolerate labor and determines fetal well-being.
- Fetus is exposed to the stress of contractions to assess the adequacy of placental perfusion under simulated labor conditions.
- Test is performed if nonstress test is abnormal.

Interventions

- External fetal monitor is applied to the client, and a 20- to 30-minute baseline strip is recorded.
- The uterus is stimulated to contract by the administration of a dilute dose of oxytocin or by having the client use nipple stimulation until 3 palpable contractions with a duration of 40 seconds or more in a 10-minute period have been achieved.
- Frequent maternal blood pressure readings are done, and the mother is monitored closely while increasing doses of oxytocin are given.

Results**Negative Contraction Stress Test (Normal)**

A negative result is represented by no late decelerations of the fetal heart rate (FHR).

Positive Contraction Stress Test (Abnormal)

A positive result is represented by late decelerations of the FHR, with 50% or more of the contractions in the absence of hyperstimulation of the uterus.

Equivocal

An equivocal result contains decelerations, but with less than 50% of the contractions, or uterine activity shows a hyperstimulated uterus.

Unsatisfactory

An unsatisfactory result means that adequate uterine contractions cannot be achieved, or the FHR tracing is of insufficient quality for adequate interpretation.

B. Vegan and Vegetarian Diets (see Chapter 11)

1. Ensure that the client eats a sufficient amount of varied foods to meet normal nutrient and energy needs.
2. Clients should be educated about consuming complementary proteins over the course of each day to ensure that all essential amino acids are provided.
3. Potential deficiencies in vegetarian diets include energy, protein, vitamin B₁₂, zinc, iron, calcium, omega-3 fatty acids, and vitamin D (if limited exposure to sunlight).
4. Protein consumption can be increased by consumption of a variety of vegetable protein sources based on whole grains, legumes, seeds, nuts, and vegetables combined to provide all essential amino acids.

5. To enhance absorption of iron, vegetarians should include a good source of iron and vitamin C with each meal.
6. Foods commonly eaten include tofu, tempeh, soy milk and soy products, meat analogs, legumes, nuts and seeds, sprouts, and a variety of fruits and vegetables.

C. Lactose intolerance

1. Lactose consumed by an individual with lactose intolerance can cause abdominal distention, discomfort, nausea, vomiting, cramps, and loose stools.
2. Clients with lactose intolerance need to incorporate sources of calcium other than dairy products into their dietary patterns regularly.

3. Milk may be tolerated in cooked form, such as in custards or fermented dairy products.
 4. Cheese and yogurt sometimes are tolerated.
 5. Lactase, an enzyme, may be prescribed and is taken before ingesting milk or milk products.
 6. Lactase-treated milk or lactose-free products are also available commercially.
- D. Pica
1. Pica refers to eating nonfood substances, such as dirt, clay, starch, and freezer frost.
 2. The cause is unknown; cultural values, such as beliefs regarding the effect of a material on the mother or fetus, may make pica a common practice.
 3. Iron deficiency anemia may occur as a result of pica.
- E. Cultural considerations: See [Chapter 5](#) for information on cultural considerations in nutrition.

CRITICAL THINKING What Should You Do?

Answer: Interventions for nausea and vomiting in the pregnant client include eating dry crackers before arising; avoiding brushing teeth immediately after arising; eating small, frequent, low-fat meals during the day; drinking liquids between meals rather than at meals; avoiding fried foods and spicy foods; asking the health care provider (HCP) about acupressure (some types may require a prescription); and asking the HCP about the use of herbal remedies.

Reference: Lowdermilk, Perry, Cashion, Alden (2016), p. 362.

PRACTICE QUESTIONS

244. The nurse is providing instructions to a pregnant client who is scheduled for an amniocentesis. What instruction should the nurse provide?
1. Strict bed rest is required after the procedure.
 2. Hospitalization is necessary for 24 hours after the procedure.
 3. An informed consent needs to be signed before the procedure.
 4. A fever is expected after the procedure because of the trauma to the abdomen.
245. A pregnant client in the first trimester calls the nurse at a health care clinic and reports that she has noticed a thin, colorless vaginal drainage. The nurse should make which statement to the client?
1. “Come to the clinic immediately.”
 2. “The vaginal discharge may be bothersome, but is a normal occurrence.”
 3. “Report to the emergency department at the maternity center immediately.”
 4. “Use tampons if the discharge is bothersome, but be sure to change the tampons every 2 hours.”
246. A nonstress test is performed on a client who is pregnant, and the results of the test indicate non-reactive findings. The health care provider prescribes a contraction stress test, and the results are documented as negative. How should the nurse document this finding?
1. A normal test result
 2. An abnormal test result
 3. A high risk for fetal demise
 4. The need for a cesarean section
247. Arubella titer result of a 1-day postpartum client is less than 1:8, and a rubella virus vaccine is prescribed to be administered before discharge. The nurse provides which information to the client about the vaccine? Select all that apply.
1. Breast-feeding needs to be stopped for 3 months.
2. Pregnancy needs to be avoided for 1 to 3 months.
3. The vaccine is administered by the subcutaneous route.
4. Exposure to immunosuppressed individuals needs to be avoided.
5. A hypersensitivity reaction can occur if the client has an allergy to eggs.
6. The area of the injection needs to be covered with a sterile gauze for 1 week.
248. The nurse in a health care clinic is instructing a pregnant client how to perform “kick counts.” Which statement by the client indicates a need for further instruction?
1. “I will record the number of movements or kicks.”
 2. “I need to lie flat on my back to perform the procedure.”
 3. “If I count fewer than 10 kicks in a 2-hour period, I should count the kicks again over the next 2 hours.”
 4. “I should place my hands on the largest part of my abdomen and concentrate on the fetal movements to count the kicks.”
249. The nurse is performing an assessment of a pregnant client who is at 28 weeks of gestation. The nurse measures the fundal height in centimeters and notes that the fundal height is 30 cm. How should the nurse interpret this finding?
1. The client is measuring large for gestational age.
 2. The client is measuring small for gestational age.
 3. The client is measuring normal for gestational age.
 4. More evidence is needed to determine size for gestational age.

- ❖ 250. The nurse is performing an assessment on a client who suspects that she is pregnant and is checking the client for probable signs of pregnancy. The nurse should assess for which probable signs of pregnancy? Select all that apply.
- 1. Ballottement
 - 2. Chadwick's sign
 - 3. Uterine enlargement
 - 4. Positive pregnancy test
 - 5. Fetal heart rate detected by a nonelectronic device
 - 6. Outline of fetus via radiography or ultrasonography
251. A pregnant client is seen for a regular prenatal visit and tells the nurse that she is experiencing irregular contractions. The nurse determines that she is experiencing Braxton Hicks contractions. On the basis of this finding, which nursing action is appropriate?
1. Contact the health care provider.
 2. Instruct the client to maintain bed rest for the remainder of the pregnancy.
 3. Inform the client that these contractions are common and may occur throughout the pregnancy.
 4. Call the maternity unit and inform them that the client will be admitted in a preterm labor condition.
252. A client arrives at the clinic for the first prenatal assessment. She tells the nurse that the first day of her last normal menstrual period was October 19, 2018. Using Nägele's rule, which expected date of delivery should the nurse document in the client's chart?
1. July 12, 2019
 2. July 26, 2019
 3. August 12, 2019
 4. August 26, 2019
253. The nurse is collecting data during an admission assessment of a client who is pregnant with twins. The client has a healthy 5-year-old child who was delivered at 38 weeks and tells the nurse that she does not have a history of any type of abortion or fetal demise. Using GTPAL, what should the nurse document in the client's chart?
1. G $\frac{1}{4}$ 3, T $\frac{1}{4}$ 2, P $\frac{1}{4}$ 0, A $\frac{1}{4}$ 0, L $\frac{1}{4}$ 1
 2. G $\frac{1}{4}$ 2, T $\frac{1}{4}$ 1, P $\frac{1}{4}$ 0, A $\frac{1}{4}$ 0, L $\frac{1}{4}$ 1
 3. G $\frac{1}{4}$ 1, T $\frac{1}{4}$ 1, P $\frac{1}{4}$ 1, A $\frac{1}{4}$ 0, L $\frac{1}{4}$ 1
 4. G $\frac{1}{4}$ 2, T $\frac{1}{4}$ 0, P $\frac{1}{4}$ 0, A $\frac{1}{4}$ 0, L $\frac{1}{4}$ 1

ANSWERS

244. 3

Rationale: Because amniocentesis is an invasive procedure, informed consent needs to be obtained before the procedure. After the procedure, the client is instructed to rest, but may resume light activity after the cramping subsides. The client is instructed to keep the puncture site clean and to report any complications, such as chills, fever, bleeding, leakage of fluid at the needle insertion site, decreased fetal movement, uterine contractions, or cramping. Amniocentesis is an outpatient procedure and may be done in the health care provider's office or in a special prenatal testing unit. Hospitalization is not necessary after the procedure.

Test-Taking Strategy: Focus on the **subject**, nursing implications related to amniocentesis. Recalling that this procedure is invasive will direct you to the correct option.

Review: **Amniocentesis**

Level of Cognitive Ability: Applying

Priority Concepts: Client Education; Health Care Law

References: Lowdermilk et al. (2016), p. 642; Pagana, Pagana, Pagana (2015), p. 52.

245. 2

Rationale: Leukorrhea begins during the first trimester. Many clients notice a thin, colorless or yellow vaginal discharge throughout pregnancy. Some clients become distressed about this condition, but it does not require that the client report to

the health care clinic or emergency department immediately. If vaginal discharge is profuse, the client may use panty liners, but she should not wear tampons because of the risk of infection. If the client uses panty liners, she should change them frequently. Test-Taking Strategy: Eliminate options 1 and 3 first because they are **comparable or alike**, indicating that the client requires medical attention. From the remaining options, recalling that this manifestation is a normal physiological occurrence or that tampons should be avoided will assist in directing you to the correct option.

Review: **Normal assessment findings in pregnancy**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Antepartum

Priority Concepts: Health Promotion; Reproduction

Reference: Lowdermilk et al. (2016), p. 298.

246. 1

Rationale: Contraction stress test results may be interpreted as negative (normal), positive (abnormal), or equivocal. A negative test result indicates that no late decelerations occurred in the fetal heart rate, although the fetus was stressed by 3 contractions of at least 40 seconds' duration in a 10-minute period. Options 2, 3, and 4 are incorrect interpretations.

Test-Taking Strategy: Note that options 2, 3, and 4 are **comparable or alike** in that they indicate an abnormal test result finding.

Review: The interpretation of the results of a **contraction stress test**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Antepartum
 Priority Concepts: Perfusion; Reproduction
 References: Lowdermilk et al. (2016), p. 651; Pagana, Pagana, Pagana (2015), pp. 432-433.

❖ 247. 2, 3, 4, 5

Rationale: Rubella vaccine is administered to women who have not had rubella or women who are not serologically immune. The vaccine may be administered in the immediate postpartum period to prevent the possibility of contracting rubella in future pregnancies. The live attenuated rubella virus is not communicable in breast milk; breast-feeding does not need to be stopped. The client is counseled not to become pregnant for 1 to 3 months after immunization or as specified by the health care provider because of a possible risk to a fetus from the live virus vaccine; the client must be using effective birth control at the time of the immunization. The client should avoid contact with immunosuppressed individuals because of their low immunity toward live viruses and because the virus is shed in the urine and other body fluids. The vaccine is administered by the subcutaneous route. A hypersensitivity reaction can occur if the client has an allergy to eggs because the vaccine is made from duck eggs. There is no useful or necessary reason for covering the area of the injection with a sterile gauze.

Test-Taking Strategy: Focus on the **subject**, client instructions regarding the rubella vaccine. Recalling that the rubella vaccine is a live virus vaccine will assist in selecting options 2 and 5. Next, recalling the route of administration and the contraindications associated with its use will assist in selecting options 3 and 4.

Review: Client instructions regarding the **rubella vaccine**

Level of Cognitive Ability: Analyzing
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Teaching and Learning
 Content Area: Maternity—Postpartum
 Priority Concepts: Client Education; Immunity
 Reference: Lowdermilk et al. (2016), p. 493.

248. 2

Rationale: The client should sit or lie quietly on her side to perform kick counts. Lying flat on the back is not necessary to perform this procedure, can cause discomfort, and presents a risk of vena cava (supine hypotensive) syndrome. The client is instructed to place her hands on the largest part of the abdomen and concentrate on the fetal movements. The client records the number of movements felt during a specified time period. The client needs to notify the health care provider (HCP) if she feels fewer than 10 kicks over two consecutive 2-hour intervals or as instructed by the HCP.

Test-Taking Strategy: Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. If you are unfamiliar with this procedure, recalling that the risk of vena cava (supine hypotensive) syndrome exists when the client lies on her back will direct you to the correct option.

Review: Procedure for **kick counts**
 Level of Cognitive Ability: Evaluating

Client Needs: Health Promotion and Maintenance
 Integrated Process: Teaching and Learning
 Content Area: Maternity—Antepartum
 Priority Concepts: Client Education; Perfusion
 Reference: Lowdermilk et al. (2016), pp. 635-636.

249. 3

Rationale: During the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus's age in weeks ± 2 cm. Therefore, if the client is at 28 weeks gestation, a fundal height of 30 cm would indicate that the client is measuring normal for gestational age. At 16 weeks, the fundus can be located halfway between the symphysis pubis and the umbilicus. At 20 to 22 weeks, the fundus is at the umbilicus. At 36 weeks, the fundus is at the xiphoid process.

Test-Taking Strategy: Focus on the **subject**, the location of fundal height. Remember that during the second and third trimesters (weeks 18 to 30), fundal height in centimeters approximately equals the fetus's age in weeks ± 2 cm.

Review: Measurement of **fundal height**

Level of Cognitive Ability: Analyzing
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Antepartum
 Priority Concepts: Development; Reproduction
 References: Lowdermilk et al. (2016), pp. 287, 315-319.

❖ 250. 1, 2, 3, 4

Rationale: The probable signs of pregnancy include uterine enlargement, Hegar's sign (compressibility and softening of the lower uterine segment that occurs at about week 6), Goodell's sign (softening of the cervix that occurs at the beginning of the second month), Chadwick's sign (violet coloration of the mucous membranes of the cervix, vagina, and vulva that occurs at about week 4), ballottement (rebounding of the fetus against the examiner's fingers on palpation), Braxton Hicks contractions, and a positive pregnancy test for the presence of human chorionic gonadotropin. Positive signs of pregnancy include fetal heart rate detected by electronic device (Doppler transducer) at 10 to 12 weeks and by nonelectronic device (fetoscope) at 20 weeks of gestation, active fetal movements palpable by the examiner, and an outline of the fetus by radiography or ultrasonography.

Test-Taking Strategy: Focusing on the **subject**, probable signs of pregnancy, will assist in answering this question. Remember that detection of the fetal heart rate and an outline of the fetus via radiography or ultrasonography are positive signs of pregnancy.

Review: **Probable signs of pregnancy**

Level of Cognitive Ability: Analyzing
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Antepartum
 Priority Concepts: Development; Reproduction
 Reference: Lowdermilk et al. (2016), pp. 286, 302.

251. 3

Rationale: Braxton Hicks contractions are irregular, painless contractions that may occur intermittently throughout

pregnancy. Because Braxton Hicks contractions may occur and are normal in some pregnant women during pregnancy, there is no reason to notify the health care provider. This client is not in preterm labor and, therefore, does not need to be placed on bed rest or be admitted to the hospital to be monitored.

Test-Taking Strategy: Options 1 and 4 are **comparable or alike** and can be eliminated first. From the remaining options, knowing that Braxton Hicks contractions are common and normal and can occur throughout pregnancy will assist in directing you to the correct option.

Review: Physiology associated with **Braxton Hicks contractions**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Antepartum

Priority Concepts: Clinical Judgment; Reproduction

Reference: Lowdermilk et al. (2016), p. 287.

252. 2

Rationale: Accurate use of Nägele's rule requires that the woman have a regular 28-day menstrual cycle. Subtract 3 months and add 7 days to the first day of the last menstrual period, and then add 1 year to that date: first day of the last menstrual period, October 19, 2018; subtract 3 months, July 19, 2018; add 7 days, July 26, 2018; add 1 year, July 26, 2019.

Test-Taking Strategy: Focus on the **subject** and use knowledge regarding Nägele's rule to answer this question. This rule requires addition and subtraction, so read all options carefully, noting the dates and years in the options, before selecting an answer.

Review: **Nägele's rule**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Antepartum

Priority Concepts: Development; Reproduction

Reference: Lowdermilk et al. (2016), p. 302.

253. 2

Rationale: Pregnancy outcomes can be described with the acronym GTPAL. G is gravidity, the number of pregnancies; T is term births, the number born at term (longer than 37 weeks); P is preterm births, the number born before 37 weeks of gestation; A is abortions or miscarriages, the number of abortions or miscarriages (included in gravida if before 20 weeks of gestation; included in parity [number of births] if past 20 weeks of gestation); and L is the number of current living children. A woman who is pregnant with twins and has a child has a gravida of 2. Because the child was delivered at 38 weeks, the number of term births is 1, and the number of preterm births is 0. The number of abortions is 0, and the number of living children is 1.

Test-Taking Strategy: Focus on the **subject** of the question. Recalling the meaning of the acronym GTPAL and focusing on the information in the question will direct you to the correct option.

Review: **GTPAL**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Antepartum

Priority Concepts: Clinical Judgment; Reproduction

CHAPTER 26

Risk Conditions Related to Pregnancy

PRIORITY CONCEPTS Reproduction, Safety

CRITICAL THINKING What Should You Do?

A pregnant client with diabetes mellitus asks the nurse about insulin needs during pregnancy. What information should the nurse provide to the client?

Answer located on p. 327.

I. Abortion

- A. Description: A pregnancy that ends before 20 weeks' gestation, spontaneously or electively
- B. Types (Box 26-1)
- C. Assessment
 - 1. Spontaneous vaginal bleeding
 - 2. Low uterine cramping or contractions
 - 3. Blood clots or tissue through the vagina
 - 4. Hemorrhage and shock can result if bleeding is excessive.
- D. Interventions
 - 1. Maintain bed rest as prescribed.
 - 2. Monitor vital signs.
 - 3. Monitor for cramping and bleeding.
 - 4. Count perineal pads to evaluate blood loss, and save expelled tissues and clots.
 - 5. Maintain intravenous (IV) fluids as prescribed; monitor for signs of hemorrhage or shock.
 - 6. Prepare the client for dilation and curettage as prescribed for incomplete abortion.
 - 7. Administer Rh_o(D) immune globulin, as prescribed, for an Rh-negative woman.
 - 8. Provide psychological support.

II. Anemia

- A. Description
 - 1. Iron deficiency anemia is a condition that develops as a result of an inadequate amount of serum iron.
 - 2. Anemia predisposes the client to postpartum infection.

B. Assessment

- 1. Fatigue
- 2. Headache
- 3. Pallor
- 4. Tachycardia
- 5. Hemoglobin value is usually less than 10 g/dL (100 mmol/L); hematocrit value is usually less than 30%.

C. Interventions

- 1. Monitor hemoglobin and hematocrit levels every 2 weeks.
- 2. Administer and instruct the client about iron and folic acid supplements.
- 3. Instruct the client to take iron with a source of vitamin C to increase its absorption and to avoid taking iron with tea, milk products, or caffeine. Iron is absorbed best if taken between meals.
- 4. Instruct the client to eat foods high in iron, folic acid, and protein.
- 5. Teach the client to monitor for signs and symptoms of infection.
- 6. Prepare to administer parenteral iron or blood transfusions; this may be prescribed for severe anemia.
- 7. Prepare for the administration of oxytocic medications in the postpartum period if excessive bleeding is a concern.

III. Cardiac Disease

- A. Description: A pregnant client with cardiac disease may be unable physiologically to cope with the added plasma volume and increased cardiac output that occur during pregnancy; blood volume peaks at weeks 32 to 34 and then declines slightly to week 40.
- B. Maternal cardiac disease risk groups (Box 26-2)
- C. Assessment
 - 1. Signs and symptoms of cardiac decompensation
 - a. Cough and respiratory congestion
 - b. Dyspnea and fatigue
 - c. Palpitations and tachycardia
 - d. Peripheral edema
 - e. Chest pain

BOX 26-1 Types of Abortions

Spontaneous: Pregnancy ends because of natural causes.
 Induced: Therapeutic or elective reasons exist for terminating pregnancy.
 Threatened: Spotting and cramping occur without cervical change.
 Inevitable: Spotting and cramping occur and cervix begins to dilate and efface.
 Incomplete: Loss of some of the products of conception occurs, with part of the products retained (most often placenta is retained).
 Complete: Loss of all products of conception.
 Missed: Products of conception are retained in utero after fetal death.
 Habitual: Spontaneous abortions occur in 3 or more successive pregnancies.

BOX 26-2 Maternal Cardiac Disease Risk Groups**Group I (Mortality Rate, 1%)**

- Corrected tetralogy of Fallot
- Pulmonic or tricuspid disease
- Mitral stenosis (classes I and II)
- Patent ductus arteriosus
- Ventricular septal defect
- Atrial septal defect
- Porcine valve

Group II (Mortality Rate, 5% to 15%)

- Mitral stenosis with atrial fibrillation
- Artificial heart valves
- Mitral stenosis (classes III and IV)
- Uncorrected tetralogy
- Aortic coarctation (uncomplicated)
- Aortic stenosis

Group III (Mortality Rate, 25% to 50%)

- Aortic coarctation (complicated)
- Myocardial infarction
- Marfan syndrome
- True cardiomyopathy
- Pulmonary hypertension

From Lowdermilk D, Cashion MC, Perry S: Maternity & women's health care, ed 10, St. Louis, 2012, Mosby.

2. Signs of respiratory infection
3. Signs of heart failure and pulmonary edema

D. Interventions

1. Monitor vital signs, fetal heart rate, and condition of the fetus.
2. Limit physical activities, and stress the need for sufficient rest.
3. Monitor for signs of cardiac stress and decompensation, such as cough, fatigue, dyspnea, chest pain, and tachycardia; also monitor for signs of heart failure and pulmonary edema.

4. Encourage adequate nutrition to prevent anemia, which would worsen the cardiac status; in addition, a low-sodium diet may be prescribed to prevent fluid retention and heart failure.
5. Avoid excessive weight gain.
6. During labor, prepare to do the following:
 - a. Monitor vital signs frequently.
 - b. Place the client on a cardiac monitor and on an external fetal monitor.
 - c. Maintain bed rest, with the client lying on her side with her head and shoulders elevated.
 - d. Administer oxygen as prescribed.
 - e. Manage pain early in labor.
 - f. Use controlled pushing efforts to decrease cardiac stress.

 Excessive weight gain places stress on the heart. In addition, obesity places the client at increased risk for complications during pregnancy.

IV. Chorioamnionitis**A. Description**

1. Bacterial infection of the amniotic cavity; can result from premature or prolonged rupture of the membranes, vaginitis, amniocentesis, or intrauterine procedures
2. May result in the development of postpartum endometritis and neonatal sepsis

B. Assessment

1. Uterine tenderness and contractions
2. Elevated temperature
3. Maternal or fetal tachycardia
4. Foul odor to amniotic fluid
5. Leukocytosis

C. Interventions

1. Monitor maternal vital signs and fetal heart rate.
2. Monitor for uterine tenderness, contractions, and fetal activity.
3. Monitor results of blood cultures.
4. Prepare for amniocentesis to obtain amniotic fluid for Gram stain and leukocyte count.
5. Administer antibiotics as prescribed after cultures are obtained.
6. Administer oxytocic medications as prescribed to increase uterine tone.
7. Prepare to obtain neonatal cultures after birth.

V. Diabetes Mellitus**A. Description**

1. Pregnancy places demands on carbohydrate metabolism and causes insulin requirements to change.
2. Maternal glucose crosses the placenta, but insulin does not.
3. The fetus produces its own insulin and pulls glucose from the mother, which predisposes the mother to hypoglycemic reactions.

4. The **newborn** of a diabetic mother may be large in size, but has functions related to gestational age rather than size.
5. The newborn of a diabetic mother is at risk for hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, and congenital anomalies.

 **During the first trimester, maternal insulin needs decrease. During the second and third trimesters, increases in placental hormones cause an insulin-resistant state, requiring an increase in the client's insulin dose. After placental delivery, placental hormone levels abruptly decrease and insulin requirements decrease.**

B. Gestational diabetes mellitus

1. Gestational diabetes occurs in pregnancy (during the second or third trimester) in clients not previously diagnosed as diabetic and occurs when the pancreas cannot respond to the demand for more insulin.
2. Pregnant women should be screened for gestational diabetes between 24 and 28 weeks of gestation.
3. A 3-hour oral glucose tolerance test is performed to confirm gestational diabetes mellitus.
4. Gestational diabetes frequently can be treated by diet alone; however, some clients may need insulin.
5. Most women with gestational diabetes return to a euglycemic state after birth; however, these individuals have an increased risk of developing diabetes mellitus in their lifetimes.

C. Predisposing conditions to gestational diabetes

1. Older than 35 years
2. Obesity
3. Multiple gestation
4. Family history of diabetes mellitus
5. Large for gestational age fetus

D. Assessment

1. Excessive thirst
2. Hunger
3. Weight loss
4. Frequent urination
5. Blurred vision
6. Recurrent urinary tract infections and vaginal yeast infections
7. Glycosuria and ketonuria
8. Signs of gestational hypertension
9. Polyhydramnios
10. Large for gestational age fetus

E. Interventions

1. Employ diet, medications (if diet cannot control blood glucose levels), exercise, and blood glucose determinations to maintain blood glucose levels between 65 mg/dL (3.7 mmol/L) and 130 mg/dL (7.4 mmol/L) as prescribed.

2. Observe for signs of hyperglycemia, glycosuria and ketonuria, and hypoglycemia.
3. Monitor weight.
4. Increase calorie intake as prescribed, with adequate insulin therapy so that glucose moves into the cells.
5. Assess for signs of maternal complications such as preeclampsia (hypertension and proteinuria).
6. Monitor for signs of infection.
7. Instruct the client to report burning and pain on urination, vaginal discharge or itching, or any other signs of infection to the health care provider (HCP).
8. Assess fetal status and monitor for signs of fetal compromise.

F. Interventions during **labor**

1. Monitor fetal status continuously for signs of distress and, if noted, prepare the client for immediate cesarean section.
2. Carefully regulate insulin and provide glucose intravenously as prescribed because labor depletes glycogen.

G. Interventions during the postpartum period

1. Observe the mother closely for a hypoglycemic reaction because a precipitous decline in insulin requirements normally occurs (the mother may not require insulin for the first 24 hours).
2. Reregulate insulin needs as prescribed after the first day, according to blood glucose testing.
3. Assess dietary needs, based on blood glucose testing and insulin requirements.
4. Monitor for signs of infection or postpartum hemorrhage.

VI. Disseminated Intravascular Coagulation (DIC)

A. Description: DIC is a maternal condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation (Fig. 26-1).

 **The rapid and extensive formation of clots that occurs in DIC causes the platelets and clotting factors to be depleted; this results in bleeding and the potential vascular occlusion of organs from thromboembolus formation.**

B. Predisposing conditions (Box 26-3)

C. Assessment

1. Uncontrolled bleeding
2. Bruising, purpura, petechiae, and ecchymosis
3. Presence of occult blood in excretions such as stool
4. Hematuria, hematemesis, or vaginal bleeding
5. Signs of shock
6. Decreased fibrinogen level, platelet count, and hematocrit level
7. Increased prothrombin time and partial thromboplastin time, clotting time, and fibrin degradation products

FIGURE 26-1 Pathophysiology of disseminated intravascular coagulation.

BOX 26-3 Predisposing Conditions for Disseminated Intravascular Coagulation

- Abruptio placentae
- Amniotic fluid embolism
- Gestational hypertension
- HELLP syndrome
- Intrauterine fetal death
- Liver disease
- Sepsis

D. Interventions

1. Remove underlying cause.
2. Monitor vital signs; assess for bleeding and signs of shock.
3. Prepare for oxygen therapy, volume replacement, blood component therapy, and possibly heparin therapy.
4. Monitor for complications associated with fluid and blood replacement and heparin therapy.
5. Monitor urine output and maintain at least 30 mL/hour (renal failure is a complication of DIC).

VII. Ectopic Pregnancy

A. Description

1. **Implantation** of the fertilized ovum outside of the uterine cavity

FIGURE 26-2 Sites of tubal ectopic pregnancy. Numbers indicate the order of prevalence.

2. Most common location is the ampulla of the fallopian tube (Fig. 26-2).

B. Assessment

1. Missed menstrual period
2. Abdominal pain
3. Vaginal spotting to bleeding that is dark red or brown
4. Rupture: Increased pain, referred shoulder pain, signs of shock

C. Interventions

1. Obtain assessment data and vital signs.
2. Monitor bleeding and initiate measures to prevent rupture and shock.
3. Methotrexate, a folic acid antagonist, may be prescribed to inhibit cell division in the developing **embryo**.
4. Prepare the client for laparotomy and removal of the pregnancy and tube, if necessary, or repair of the tube.
5. Administer antibiotics; Rh₀(D) immune globulin is prescribed for Rh-negative women.

VIII. Endometritis

A. Description

1. Endometritis is an infection of the lining of the **uterus** occurring in the postpartum period and caused by bacteria that invade the uterus at the placental site.
2. The infection may spread and involve the entire endometrium and cause peritonitis or pelvic thrombophlebitis.

B. Assessment

1. Chills and fever
2. Increased pulse
3. Decreased appetite
4. Headache
5. Backache
6. Prolonged, severe afterpains
7. Tender, large uterus

8. Foul odor to lochia or reddish brown lochia
9. Ileus
10. Elevated white blood cell count, with left shift of immature cells

C. Interventions

1. Monitor vital signs.
2. Position the client in Fowler's position to facilitate drainage of lochia.
3. Provide a private room for the mother; inform the mother that isolation of the newborn from the mother is unnecessary.
4. Instruct the mother in proper hand-washing techniques.
5. Initiate contact precautions as necessary.
6. Monitor intake and output and encourage fluid intake.
7. Administer antibiotics as prescribed.
8. Administer comfort measures such as back rubs and position changes and pain medications as prescribed.
9. Administer oxytocic medications as prescribed to improve uterine tone.
10. Provide psychological support.

IX. Fetal Death in Utero

A. Description

1. Fetal death in utero refers to the death of a fetus after the twentieth week of gestation and before birth.
2. The client can develop DIC if the dead fetus is retained in the uterus for 3 to 4 weeks or longer.

B. Assessment

1. Absence of fetal movement
2. Absence of fetal heart tones
3. Maternal weight loss
4. Lack of fetal growth or decrease in fundal height
5. No evidence of fetal cardiac activity
6. Other characteristics suggestive of fetal death noted on ultrasound

C. Interventions

1. Prepare for the birth of the fetus.
2. Support the client's decision about labor, birth, and the postpartum period.
3. Accept behaviors such as anger and hostility from the parents.
4. Refer the parents to an appropriate support group.

 Cultural, spiritual, and religious practices and beliefs are important to consider when caring for the parents of a fetus who has died. Be aware of the cultural, spiritual, and religious practices and beliefs of the client.

X. Hepatitis B

A. Description

1. The risks of prematurity, low birth weight, and neonatal death increase if the mother has hepatitis B infection.

2. Hepatitis is transmitted through blood, saliva, vaginal secretions, semen, and breast milk and across the placental barrier.

B. Interventions

1. Minimize the risk for intrapartum ascending infections (limit the number of vaginal examinations).
2. Remove maternal blood from the neonate immediately after birth.
3. Suction the fluids from the neonate immediately after birth.
4. Bathe the neonate before any invasive procedures.
5. Clean and dry the face and eyes of the neonate before instilling eye prophylaxis.
6. Infection of the neonate can be prevented by the administration of hepatitis B immune globulin and hepatitis B vaccine soon after birth.
7. Discourage the mother from kissing the neonate until the neonate has received the vaccine.
8. Inform the mother that the hepatitis B vaccine will be administered to the neonate and that a second dose should be administered at 1 month after birth and a third dose at 6 months after birth.

 Support breast-feeding after neonatal treatment for hepatitis B; breast-feeding is not contraindicated if the neonate has been vaccinated.

XI. Hematoma

A. Description

1. Hematoma occurs following the escape of blood into the maternal tissue after birth.
2. Predisposing conditions include operative delivery with forceps or injury to a blood vessel.

B. Assessment (Box 26-4)

C. Interventions

1. Monitor vital signs.
2. Monitor client for abnormal pain, especially when forceps delivery has been performed.
3. Apply ice to the hematoma site.
4. Administer analgesics as prescribed.

BOX 26-4 Hematoma: Assessment Findings

- Abnormal, severe pain
- Pressure in perineal area (client states that she feels like she has to have a bowel movement)
- Palpable, sensitive swelling in the perineal area, with discolored skin
- Inability to void
- Decreased hemoglobin and hematocrit levels
- Signs of shock, such as pallor, tachycardia, and hypotension, if significant blood loss has occurred

5. Monitor intake and output.
6. Encourage fluids and voiding; prepare for urinary catheterization if the client is unable to void.
7. Administer blood replacements as prescribed.
8. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
9. Administer antibiotics as prescribed because infection is common after hematoma formation.
10. Prepare for incision and evacuation of the hematoma if necessary.

XII. Human Immunodeficiency Virus (HIV) and Acquired Immunodeficiency Syndrome (AIDS)

A. Description

1. HIV is the causative agent of AIDS.
2. Women infected with HIV may first show signs and symptoms at the time of pregnancy or possibly develop life-threatening infections because normal pregnancy involves some suppression of the maternal immune system.
3. Repeated exposure to the virus during pregnancy through unsafe sex practices or IV drug use can increase the risk of transmission to the fetus.
4. Zidovudine is recommended for the prevention of maternal-to-fetal HIV transmission and is administered orally beginning after 14 weeks of gestation, intravenously during labor, and in the form of syrup to the newborn for 6 weeks after birth.

B. Transmission

1. Sexual exposure to genital secretions of an infected person
2. Parenteral exposure to infected blood and tissue
3. Perinatal exposure of an **infant** to infected maternal secretions through birth or breast-feeding

C. Risks to the mother: A mother with HIV is managed as high risk because she is vulnerable to infections.

D. Diagnosis

1. Tests used to determine the presence of antibodies to HIV include enzyme-linked immunosorbent assay (ELISA), Western blot, and immunofluorescence assay (IFA).
2. A single reactive ELISA test by itself cannot be used to diagnose HIV, and the test should be repeated with the same blood sample; if the result is again reactive, follow-up tests using Western blot or IFA should be done.
3. A positive Western blot or IFA is considered confirmatory for HIV.
4. A positive ELISA that fails to be confirmed by Western blot or IFA should not be considered negative, and repeat testing should be done in 3 to 6 months.
5. See [Chapter 10](#) for additional laboratory tests.

E. Assessment (see [Chapter 66](#))

F. Interventions

1. Prenatal period

- a. Prevent opportunistic infections.
- b. Avoid procedures that increase the risk of perinatal transmission, such as amniocentesis and fetal scalp sampling.

2. Intrapartum period

- a. If the fetus has not been exposed to HIV in utero, the highest risk exists during delivery through the birth canal.
- b. Avoid the use of internal scalp electrodes for monitoring of the fetus.
- c. Avoid episiotomy to decrease the amount of maternal blood in and around the birth canal.
- d. Avoid the administration of oxytocin because contractions induced by oxytocin can be strong, causing vaginal tears or necessitating an episiotomy.
- e. Place heavy absorbent pads under the mother's hips to absorb amniotic fluid and maternal blood.
- f. Minimize the neonate's exposure to maternal blood and body fluids; promptly remove the neonate from the mother's blood after delivery.
- g. Suction fluids from the neonate promptly.
- h. Prepare to administer zidovudine as prescribed to the mother during labor and delivery.

3. Postpartum period

- a. Monitor for signs of infection.
- b. Place the mother in protective isolation if she is immunosuppressed.
- c. Restrict breast-feeding.
- d. Instruct the mother to monitor for signs of infection and report any signs if they occur.

G. The **newborn** and HIV

1. Description

- a. Neonates born to HIV-positive clients may test positive because antibodies received from the mother may persist for 18 months after birth; all neonates acquire maternal antibody to HIV infection, but not all acquire infection.
- b. The use of antiviral medication, reduced exposure of the neonate to maternal blood and body fluids, and early identification of HIV in pregnancy reduce the risk of transmission to the neonate.

2. Interventions

- a. Bathe the **neonate** carefully before any invasive procedure, such as the administration of vitamin K, heel sticks, or venipunctures; clean the umbilical cord stump meticulously every day until healed.
- b. The newborn can room with the mother.

- c. Administer zidovudine to the newborn as prescribed for the first 6 weeks of life.
- d. All HIV-exposed newborns should be treated with medication to prevent infection by *Pneumocystis jiroveci*.
- e. HIV culture is recommended at 1 and 4 months after birth; infants at risk for HIV infection should be seen by the HCP at birth and at 1 week, 2 weeks, 1 month, 2 months, and 4 months of age.
- f. The child may be asymptomatic for the first several years of life and should be monitored for early signs of immunodeficiency

 **Infants at risk for HIV infection need to receive all recommended immunizations on the regular schedule; however, no live vaccines should be administered.**

XIII. Hydatidiform Mole

A. Description

1. Hydatidiform mole is a form of gestational trophoblastic disease that occurs when the trophoblasts, which are the peripheral cells that attach the fertilized ovum to the uterine wall, develop abnormally.
2. The mole manifests as an edematous grapelike cluster that may be nonmalignant or may develop into choriocarcinoma.

B. Assessment

1. Fetal heart rate not detectable
2. Vaginal bleeding, which may occur by the fourth week or not until the second trimester; may be bright red or dark brown in color and may be slight, profuse, or intermittent
3. Signs of preeclampsia (elevated blood pressure and proteinuria) before the twentieth week of gestation
4. Fundal height greater than expected for gestational date
5. Elevated human chorionic gonadotropin levels
6. Characteristic snowstorm pattern shown on ultrasound

C. Interventions

1. Prepare the client for uterine evacuation (before evacuation, diagnostic tests are done to detect metastatic disease).
2. Evacuation of the mole is done by vacuum aspiration; oxytocin is administered after evacuation to contract the uterus.
3. Monitor for postprocedure hemorrhage and infection.
4. Tissue is sent to the laboratory for evaluation, and follow-up is important to detect changes suggestive of malignancy.
5. Human chorionic gonadotropin levels are monitored every 1 to 2 weeks until normal prepregnancy levels are attained; levels are checked every 1 to 2 months for 1 year.

6. Instruct the client and her partner about birth control measures so that pregnancy can be prevented during the 1-year follow-up period.

XIV. Hyperemesis Gravidarum

A. Description: Intractable nausea and vomiting during the first trimester that causes disturbances in nutrition and fluid and electrolyte balance

B. Assessment

1. Nausea most pronounced on arising; may occur at other times during the day
2. Persistent vomiting
3. Weight loss
4. Signs of dehydration
5. Fluid and electrolyte imbalances

C. Interventions

1. Initiate measures to alleviate nausea, including medication therapy; if unsuccessful, and weight loss and fluid and electrolyte imbalances occur, intravenously administered fluid and electrolyte replacement or parenteral nutrition may be necessary.
2. Monitor vital signs, intake and output, weight, and calorie count.
3. Monitor laboratory data and for signs of dehydration and electrolyte imbalances.
4. Monitor urine for ketones.
5. Monitor fetal heart rate, activity, and growth.
6. Encourage intake of small portions of food (low-fat, easily digestible carbohydrates, such as cereals, rice, and pasta).
7. Encourage the intake of liquids between meals to avoid distending the stomach and triggering vomiting.
8. Encourage the client to sit upright after meals.

XV. Gestational Hypertension

A. Description and types: Hypertension can be mild or severe, leading to preeclampsia and then eclampsia (seizures) (Table 26-1).

 **Signs of preeclampsia are hypertension and proteinuria.**

B. Assessment (Table 26-2)

C. Predisposing conditions

1. Primigravida
2. Women younger than 19 years or older than 40 years
3. Chronic renal disease
4. Chronic hypertension
5. Diabetes mellitus
6. Rh incompatibility
7. History of or family history of gestational hypertension

D. Complications of gestational hypertension

1. Abruptio placentae
2. Disseminated intravascular coagulation

TABLE 26-1 Classification of Hypertensive Stages of Pregnancy

Type	Description
Gestational Hypertensive Disorders	
Gestational hypertension	Blood pressure elevation detected first time after mid-pregnancy without proteinuria
Preeclampsia	Pregnancy-specific syndrome that usually occurs after 20 wk of gestation and is determined by gestational hypertension plus proteinuria
Eclampsia	Occurrence of seizures in a preeclamptic woman
Chronic Hypertensive Disorders	
Chronic hypertension	Hypertension that is present and observable before pregnancy or that is diagnosed before week 20 of gestation
Preeclampsia superimposed on chronic hypertension	Chronic hypertension with new proteinuria or exacerbation of hypertension (previously well controlled) or proteinuria, thrombocytopenia, or increases in hepatocellular enzymes

From Lowdermilk D, Perry S, Cashion K, Alden K: *Maternity & women's health care*, ed 10, St. Louis, 2012, Mosby.

3. Thrombocytopenia
 4. Placental insufficiency
 5. Intrauterine growth restriction
 6. Intrauterine fetal death
 7. HELLP syndrome (a laboratory diagnosis for severe preeclampsia characterized by hemolysis, elevated liver enzyme levels, and low platelet count)
- E. Interventions for mild hypertension
1. Monitor blood pressure.
 2. Monitor fetal activity and fetal growth.
 3. Encourage frequent rest periods, instructing the client to lie in the lateral position.
 4. Administer antihypertensive medications as prescribed; teach client about the importance of the medications.
 5. Monitor intake and output.
 6. Evaluate renal function through prescribed studies such as blood urea nitrogen, serum creatinine, and 24-hour urine levels for creatinine clearance and protein.
- F. Interventions for mild preeclampsia
1. Provide bed rest and place the client in the lateral position.
 2. Monitor blood pressure and weight.
 3. Monitor neurological status because changes can indicate cerebral hypoxia or impending seizure.

TABLE 26-2 Mild Versus Severe Preeclampsia

Parameter Evaluated	Mild	Severe
Systolic blood pressure	≥140 but < 160 mm Hg	≥160 mm Hg (two readings, 6 hr apart, while on bed rest)
Diastolic blood pressure	≥90 but < 110 mm Hg	≥110 mm Hg
Proteinuria (24-hr specimen is preferred to eliminate hour-to-hour variations)	≥0.3 but < 2 g in 24-hr specimen (1+ on random dipstick)	≥5 g in 24-hr specimen (≥3+ on random dipstick sample)
Creatinine, serum (renal function)	Normal	Elevated (> 1.0 mg/dL [> 76.3 $\mu\text{mol/L}$])
Platelets	Normal	Decreased (< 100,000 mm^3 [$< 100 \times 10^9/\text{L}$])
Liver enzymes (alanine aminotransferase or aspartate aminotransferase)	Normal or minimal increase in levels	Elevated levels
Urine output	Normal	Oliguria common, often < 500 mL/day
Severe, unrelenting headache not attributable to other cause; mental confusion (cerebral edema)	Absent	Often present
Persistent right upper quadrant or epigastric pain or pain penetrating to back (distention of liver capsule); nausea and vomiting	Absent	May be present and often precedes seizure
Visual disturbances (spots or "sparkles"; temporary blindness; photophobia)	Absent to minimal	Common
Pulmonary edema; heart failure; cyanosis	Absent	May be present
Fetal growth restriction	Normal growth	Growth restriction; reduced amniotic fluid volume

Modified from Lowdermilk D, Cashion MC, Perry S, Alden K: *Maternity & women's health care*, ed 10, St. Louis, 2012, Mosby.

BOX 26-5 Assessment of Reflexes**Biceps**

Position thumb over client's biceps tendon, supporting client's elbow with the palm of the hand.

Strike a downward blow over the thumb with percussion hammer.

Normal response: Flexion of the arm at the elbow

Patellar

Position client with her legs dangling over the edge of the examining table or lying on her back with her legs slightly flexed.

Strike patellar tendon just below kneecap with percussion hammer.

Normal response: Extension or kicking out of the leg

Clonus

Position client with her legs dangling over the edge of examining table.

Support the leg with 1 hand and sharply dorsiflex client's foot with the other hand.

Maintain the dorsiflexed position for a few seconds and then release foot.

Normal response (negative clonus response):

Foot remains steady in dorsiflexed position.

No rhythmic oscillations or jerking of foot is felt.

When released, foot drops to plantar-flexed position with no oscillations.

Abnormal response (positive clonus response):

Rhythmic oscillations occur when foot is dorsiflexed.

Similar oscillations are noted when foot drops to plantar-flexed position.

Grading Response

0 Reflex absent

1+ Reflex present but hypoactive

2+ Normal reflex

3+ Hyperactive reflex

4+ Hyperactive reflex with clonus present

4. Monitor deep tendon reflexes and for the presence of hyperreflexia or clonus, because hyperreflexia indicates increased central nervous system irritability ([Box 26-5](#)).

5. Provide adequate fluids.

6. Monitor intake and output; a urinary output of 30 mL/hour indicates adequate renal perfusion.

7. Increase dietary protein and carbohydrates with no added salt.

8. Administer medications as prescribed to reduce blood pressure; blood pressure should not be reduced drastically because placental perfusion can be compromised.

9. Monitor for HELLP syndrome.

G. Interventions for severe preeclampsia

1. Maintain bed rest.

2. Administer magnesium sulfate (use a controlled infusion device) as prescribed to prevent seizures; magnesium sulfate may be continued for 24 to 48 hours postpartum.

3. Monitor for signs of magnesium toxicity, including flushing, sweating, hypotension, depressed deep tendon reflexes, urine output, and central nervous system depression including respiratory depression; keep antidote (calcium gluconate) available for immediate use, if necessary.

4. Administer antihypertensives as prescribed.

5. Prepare for the induction of labor.

H. Eclampsia

1. Assessment: Characterized by generalized seizures ([Box 26-6](#))

2. Interventions (see [Priority Nursing Actions](#))

PRIORITY NURSING ACTIONS**Eclampsia Event**

1. Remain with the client and call for help.
2. Ensure an open airway, turn the client on her side, and administer oxygen by face mask at 8 to 10 L/minute.
3. Monitor fetal heart rate patterns.
4. Administer medications to control the seizures as prescribed.
5. After the seizure has ended, insert an oral airway and suction the client's mouth as needed.
6. Prepare for delivery of the fetus after stabilization of the client, if warranted.
7. Document occurrence, client's response, and outcome.

Eclampsia refers to the occurrence of a seizure. It is a potentially preventable extension of severe preeclampsia; early identification of preeclampsia in a pregnant client allows intervention before the condition reaches the seizure state. If eclampsia occurs, the nurse remains with the client and calls for help. The nurse ensures an open airway. If the client is not on her side already, the nurse attempts to turn the client on her side. The side-lying position permits greater circulation through the placenta and may help to prevent aspiration. The nurse administers oxygen by face mask at 8 to 10 L/minute to ensure adequate placental oxygenation. The nurse also notes the time the seizure began and the duration of the seizure and protects the client from injury during the event. The nurse monitors fetal heart rate patterns closely and administers medications as prescribed (magnesium sulfate may be prescribed). After the seizure has ended, the nurse inserts an oral airway to maintain airway patency and suctions the client's mouth as needed. If warranted, the nurse prepares for the delivery of the fetus after stabilization of the client. The nurse documents the occurrence, the client's response, and the outcome.

Reference

Lowdermilk et al. (2016), p. 667.

BOX 26-6 Eclampsia

1. Seizure typically begins with twitching around the mouth.
2. Body then becomes rigid in a state of tonic muscular contractions that last 15 to 20 seconds.
3. Facial muscles and then all body muscles alternately contract and relax in rapid succession (clonic phase may last about 1 minute).
4. Respiration ceases during seizure because diaphragm tends to remain fixed (breathing resumes shortly after the seizure).
5. Postictal sleep occurs.

XVI. Incompetent Cervix**A. Description**

1. Incompetent cervix refers to premature dilation of the cervix, which occurs most often in the fourth or fifth month of pregnancy and is associated with structural or functional defects of the cervix.
2. Treatment involves surgical placement of a cervical cerclage.

B. Assessment

1. Vaginal bleeding
2. Fetal membranes visible through the cervix

C. Interventions

1. Provide bed rest, hydration, and tocolysis, as prescribed, to inhibit uterine contractions.
2. Prepare for cervical cerclage (at 10 to 14 weeks of gestation), in which a band of fascia or nonabsorbable ribbon is placed around the cervix beneath the mucosa to constrict the internal os.
3. After cervical cerclage, the client is told to refrain from intercourse and to avoid prolonged standing and heavy lifting.
4. The cervical cerclage is removed at 37 weeks of gestation or left in place and a cesarean birth is performed; if removed, cerclage must be repeated with each successive pregnancy.
5. After placement of the cervical cerclage, monitor for contractions, rupture of the membranes, and signs of infection.
6. Instruct the client to report to the HCP immediately any postprocedure vaginal bleeding or increased uterine contractions.

XVII. Infections (TORCH Complex Acronym)**A. Toxoplasmosis (“T”)**

1. Caused by infection with the intracellular protozoan parasite *Toxoplasma gondii*
2. Produces a rash and symptoms of acute, flulike infection in the mother
3. Transmitted to the mother through raw meat or handling of cat litter of infected cats
4. Organism is transmitted to the fetus across the placenta
5. Can cause spontaneous abortion in the first trimester

B. Other Infections (“O,” includes HIV—discussed earlier, syphilis—discussed under Sexually Transmitted Infections, parvovirus, hepatitis B virus [HBV], West Nile, etc.)

C. Rubella (German measles) (“R”)

1. Teratogenic in the first trimester
2. Organism is transmitted to the fetus across the placenta.
3. Causes congenital defects of the eyes, heart, ears, and brain
4. If not immune (titer less than 1:8), the client should be vaccinated in the postpartum period; the client must wait 1 to 3 months (as specified by the HCP) before becoming pregnant.

D. Cytomegalovirus (“C”)

1. Organism is transmitted through close personal contact; it is transmitted across the placenta to the fetus, or the fetus may be infected through the birth canal.
2. The mother may be asymptomatic; most infants are asymptomatic at birth.
3. Cytomegalovirus causes low birth weight, intrauterine growth restriction, enlarged liver and spleen, jaundice, blindness, hearing loss, and seizures.
4. Antiviral medications may be prescribed for severe infections in the mother, but these medications are toxic and may only temporarily suppress shedding of the virus.

E. Herpes simplex virus (“H”)

1. Herpes simplex virus affects the external genitalia, vagina, and cervix and causes draining, painful vesicles.
2. Acyclovir can be used to treat recurrent outbreaks during pregnancy or used as suppressive therapy late in pregnancy to prevent an outbreak during labor and birth.
3. Virus usually is transmitted to the fetus during birth through the infected vagina or via an ascending infection after rupture of the membranes.
4. No vaginal examinations are done in the presence of active vaginal herpetic lesions.
5. Herpes can cause death or severe neurological impairment in the newborn.
6. Delivery of the fetus is usually by cesarean section if active lesions are present in the vagina; delivery may be performed vaginally if the lesions are in the anal, perineal, or inner thigh area (strict precautions are necessary to protect the fetus during delivery).
7. Maintain contact precautions.

F. Group B Streptococcus (GBS) (may be included as an “O” under TORCH complex)

1. GBS is a leading cause of life-threatening perinatal infections.

2. The gram-positive bacterium colonizes the rectum, vagina, cervix, and urethra of pregnant and nonpregnant women.
3. Meningitis, fasciitis, and intraabdominal abscess can occur in the pregnant client if she is infected at the time of birth.
4. Transmission occurs during vaginal delivery.
5. Early-onset newborn GBS occurs within the first week after birth, usually within 48 hours, and can include infections such as sepsis, pneumonia, or meningitis; permanent neurological disability can result.
6. Diagnosis of the mother is done via vaginal and rectal cultures at 35 to 37 weeks of gestation.
7. Antibiotics such as penicillin may be prescribed for the mother during labor and birth; IV antibiotics may be prescribed for infected infants.

XVIII. Multiple Gestation

A. Description

1. Multiple gestation results from **fertilization** of 2 ova (fraternal or dizygotic) or a splitting of 1 fertilized ovum (identical or monozygotic).
2. Complications include spontaneous abortion, anemia, congenital anomalies, hyperemesis gravidarum, intrauterine growth restriction, gestational hypertension, polyhydramnios, postpartum hemorrhage, premature rupture of membranes, and preterm labor and delivery.

B. Assessment

1. Excessive fetal activity
2. Uterus large for gestational age
3. Palpation of 3 or 4 large parts in the **uterus**
4. Auscultation of more than 1 fetal heart rate
5. Excessive weight gain

C. Interventions

1. Monitor vital signs.
2. Monitor fetal heart rates, activity, and growth.
3. Monitor for cervical changes.
4. Prepare the client for ultrasound as prescribed.
5. Monitor for anemia; administer supplemental vitamins as prescribed.
6. Monitor for preterm labor, and treat preterm labor promptly.
7. Prepare for cesarean delivery for abnormal presentations.
8. Prepare to administer oxytocic medications after delivery to prevent postpartum hemorrhage from uterine overdistention.

XIX. Pyelonephritis

A. Description

1. Results from bacterial infections that extend upward from the bladder through the blood vessels and lymphatics

2. Frequently follows untreated urinary tract infections and is associated with increased incidence of anemia, low birth weight, gestational hypertension, premature labor and delivery, and premature rupture of the membranes

B. Assessment and Interventions (refer to [Chapter 58](#))

XX. Sexually Transmitted Infections

A. Chlamydia

1. Description

- a. Sexually transmitted pathogen associated with an increased risk for premature birth, stillbirth, neonatal conjunctivitis, and newborn chlamydial pneumonia
- b. Can cause salpingitis, pelvic abscesses, ectopic pregnancy, chronic pelvic pain, and infertility
- c. Diagnostic test is culture for *Chlamydia trachomatis*.

2. Assessment

- a. Usually asymptomatic
- b. Bleeding between periods or after coitus
- c. Mucoid or purulent cervical discharge
- d. Dysuria and pelvic pain

3. Interventions

- a. Screen the client to determine whether she is high risk; a vaginal culture is indicated for all pregnant clients if the client is in a high-risk group or if infants from previous pregnancies have developed neonatal conjunctivitis or pneumonia.
- b. Instruct the client in the importance of rescreening because reinfection can occur as the client nears term.
- c. Ensure that the sexual partner is treated.

B. Syphilis

1. Description

- a. Syphilis is a chronic infectious disease caused by the organism *Treponema pallidum*.
- b. Transmission is by physical contact with syphilitic lesions, which usually are found on the skin, mucous membranes of the mouth, or genitals.
- c. The infection may cause abortion or premature labor and is passed to the fetus after the fourth month of pregnancy as congenital syphilis.

2. Assessment ([Box 26-7](#))

3. Interventions

- a. Obtain a serum test (Venereal Disease Research Laboratory or rapid plasma reagin) for syphilis on the first prenatal visit; prepare to repeat the test at 36 weeks of gestation because the disease may be acquired after the initial visit.

BOX 26-7 Stages of Syphilis**Primary Stage**

- Most infectious stage
- Appearance of ulcerative, painless lesions produced by spirochetes at point of entry into the body

Secondary Stage

- Highly infectious stage
- Appearance of lesions about 6 weeks to 6 months after primary stage; located anywhere on the skin and mucous membranes
- Generalized lymphadenopathy

Tertiary Stage

- Entrance of spirochetes into internal organs, causing permanent damage; symptoms occur 10 to 30 years after untreated primary lesion
- Invasion of central nervous system, causing meningitis, ataxia, general paresis, and progressive mental deterioration
- Deleterious effects on aortic valve and aorta

- b. If the test result is positive, treatment with an antibiotic such as penicillin may be necessary.
- c. Instruct the client that treatment of her partner is necessary if infection is present.

C. Gonorrhea

1. Description

- a. Gonorrhea is an infection caused by *Neisseria gonorrhoeae*, which causes inflammation of the mucous membranes of the genital and urinary tracts.
- b. Transmission of the organism is by sexual intercourse.
- c. Infection may be transmitted to the newborn's eyes during delivery, causing blindness (ophthalmia neonatorum).

2. Assessment: Usually asymptomatic; vaginal discharge, urinary frequency, and lower abdominal pain possible

3. Interventions

- a. Obtain a vaginal culture during the initial prenatal examination to screen for gonorrhea; the culture may be repeated during the third trimester in high-risk clients.
- b. Instruct the client that treatment of her partner is necessary if infection is present.

D. Condyloma acuminatum (human papillomavirus)

1. Description

- a. Condyloma acuminatum is caused by human papillomavirus.
- b. Infection affects the cervix, urethra, anus, penis, and scrotum.
- c. A culture is indicated for clients with a positive history or with active lesions, and weekly

cultures may be done starting at week 35 or 36 of pregnancy until delivery; the test is performed to determine the route of delivery.

- d. Human papillomavirus is transmitted through sexual contact.

2. Assessment

- a. Infection produces small to large wartlike growths on the genitals.
- b. Cervical cell changes may be noted because human papillomavirus is associated with cervical malignancies.

3. Interventions

- a. Lesions are removed by the use of cytotoxic agents, cryotherapy, electrocautery, and laser.
- b. Encourage annual Papanicolaou test.
- c. Sexual contact should be avoided until lesions are healed (condoms reduce transmission).

E. Trichomoniasis

1. Description

- a. Trichomoniasis is caused by *Trichomonas vaginalis* and is transmitted via sexual contact.
- b. A normal saline wet smear of vaginal secretions indicates the presence of protozoa.
- c. Infection is associated with premature rupture of the membranes and postpartum endometritis.

2. Assessment

- a. Yellowish to greenish, frothy, mucopurulent, copious, malodorous vaginal discharge
- b. Inflammation of vulva, vagina, or both may occur.

3. Interventions

- a. Metronidazole may be prescribed.
- b. Sexual partner may need to be treated.

F. Bacterial vaginosis

1. Description

- a. Caused by *Haemophilus vaginalis* (*Gardnerella vaginalis*) and transmitted via sexual contact
- b. Associated with premature labor and birth

2. Assessment

- a. Client complains of "fishy odor" to vaginal secretions and increased odor after intercourse.
- b. Microscopic examination of vaginal secretions identifies the infection.

3. Interventions

- a. Oral metronidazole may be prescribed.
- b. Sexual partner may need to be treated.

G. Vaginal candidiasis

1. Description

- a. *Candida albicans* is the most common causative organism.
- b. Predisposing factors include use of antibiotics, diabetes mellitus, and obesity.
- c. Vaginal candidiasis is diagnosed by identifying spores of *Candida albicans*.

2. Assessment
 - a. Vulvar and vaginal pruritus
 - b. White, lumpy, cottage cheese–like discharge from vagina
3. Interventions
 - a. An antifungal vaginal preparation such as miconazole may be prescribed.
 - b. For extensive irritation and swelling, sitz baths may be prescribed.
 - c. Sexual partner may need to be treated.

XXI. Tuberculosis

A. Description

1. Highly communicable disease caused by *Mycobacterium tuberculosis*
2. Transmitted by the airborne route
3. Multidrug-resistant strains of tuberculosis can result from improper compliance, noncompliance with treatment programs, or development of mutations in tubercle bacillus.

B. Transmission

1. Transplacental transmission is rare.
2. Transmission can occur during birth through aspiration of infected amniotic fluid.
3. The newborn can become infected from contact with infected individuals.

C. Risk to mother: Active disease during pregnancy has been associated with an increase in hypertensive disorders of pregnancy.

D. Diagnosis: If a chest radiograph is required for the mother, it is done only after 20 weeks of gestation, and a lead shield for the abdomen is required.

 **Tuberculin skin testing is safe during pregnancy, however, the HCP may want to delay testing until after delivery.**

E. Assessment

1. Mother
 - a. Possibly asymptomatic
 - b. Fever and chills
 - c. Night sweats
 - d. Weight loss
 - e. Fatigue
 - f. Cough with hemoptysis or green or yellow sputum
 - g. Dyspnea
 - h. Pleural pain
2. Neonate
 - a. Fever
 - b. Lethargy
 - c. Poor feeding
 - d. Failure to thrive
 - e. Respiratory distress
 - f. Hepatosplenomegaly

- g. Meningitis
- h. Disease may spread to all major organs

F. Interventions

1. Pregnant client
 - a. Administration of isoniazid, pyrazinamide, and rifampin daily for 9 months (as prescribed); ethambutol is added if medication resistance is likely.
 - b. Pyridoxine should be administered with isoniazid to the pregnant client to prevent fetal neurotoxicity caused by isoniazid.
 - c. Promote breast-feeding only if the client is noninfectious.
2. Newborn
 - a. Management focuses on preventing disease and treating early infection.
 - b. Skin testing is performed on the newborn at birth, and the newborn may be placed on isoniazid therapy; the skin test is repeated in 3 to 4 months, and isoniazid may be stopped if the skin test results remain negative.
 - c. If the skin test result is positive, the newborn should receive isoniazid for at least 6 months (as prescribed).
 - d. If the mother's sputum is free of organisms, the newborn does not need to be isolated from the mother while in the hospital.

XXII. Urinary Tract Infection

A. Description: A urinary tract infection can occur during pregnancy (pregnancy is a predisposing factor); if untreated, the client can develop pyelonephritis.

B. Predisposing conditions

1. History of urinary tract infections
2. Sickle cell trait
3. Poor hygiene
4. Anemia
5. Diabetes mellitus

C. Assessment and Interventions (refer to [Chapter 58](#))

XXIII. Obesity in Pregnancy

A. Description: Obesity in every population, including adults and children, is a problem in the United States. Obesity in pregnancy places the client at risk for complications during pregnancy, including venous thromboembolism and increased need for cesarean birth.

B. Obesity in pregnancy can have negative effects on the newborn, including stillbirth, congenital anomalies, future obesity, and heart disease.

C. Complications in nursing care

1. Difficulty obtaining IV access, epidural access, and intubation if needed
2. Mobility and transfer difficulties
3. Bed size and equipment accommodations

- D. Potential postoperative complications and associated interventions
1. Thromboembolism stockings (TEDs), sequential compression devices (SCDs), and pharmacological venous thromboembolism prophylaxis such as heparin are used postoperatively.
 2. Early ambulation is encouraged to prevent venous thromboembolism formation.
 3. Vigilant monitoring and cleaning of surgical incisions to prevent infection due to excess abdominal fat

CRITICAL THINKING What Should You Do?

Answer: The nurse should begin by explaining to the client that pregnancy places demands on carbohydrate metabolism and causes insulin requirements to change. The nurse should inform the client that maternal glucose crosses the placenta, but insulin does not. During the first trimester, maternal insulin needs decrease. During the second and third trimesters, increases in placental hormones cause an insulin-resistant state, requiring an increase in the client's insulin dose. After placental delivery, placental hormone levels abruptly decrease and insulin requirements decrease. In addition, the fetus produces its own insulin and pulls glucose from the mother, which predisposes the mother to hypoglycemic reactions.

Reference: Lowdermilk et al. (2016), pp. 694–695.

PRACTICE QUESTIONS

254. The nurse is providing instructions to a pregnant client with human immunodeficiency virus (HIV) infection regarding care to the newborn after delivery. The client asks the nurse about the feeding options that are available. Which response should the nurse make to the client?
1. “You will need to bottle-feed your newborn.”
 2. “You will need to feed your newborn by nasogastric tube feeding.”
 3. “You will be able to breast-feed for 6 months and then will need to switch to bottle-feeding.”
 4. “You will be able to breast-feed for 9 months and then will need to switch to bottle-feeding.”
255. The home care nurse visits a pregnant client who has a diagnosis of mild preeclampsia. Which assessment finding indicates a worsening of the preeclampsia and the need to notify the health care provider (HCP)?
1. Urinary output has increased.
 2. Dependent edema has resolved.
 3. Blood pressure reading is at the prenatal baseline.
 4. The client complains of a headache and blurred vision.
256. A stillborn baby was delivered in the birthing suite a few hours ago. After the delivery, the family remained together, holding and touching the baby. Which statement by the nurse would assist the family in their period of grief?
1. “What can I do for you?”
 2. “Now you have an angel in heaven.”
 3. “Don’t worry, there is nothing you could have done to prevent this from happening.”
 4. “We will see to it that you have an early discharge so that you don’t have to be reminded of this experience.”
257. The nurse implements a teaching plan for a pregnant client who is newly diagnosed with gestational diabetes mellitus. Which statement made by the client indicates a need for further teaching?
1. “I should stay on the diabetic diet.”
 2. “I should perform glucose monitoring at home.”
 3. “I should avoid exercise because of the negative effects on insulin production.”
 4. “I should be aware of any infections and report signs of infection immediately to my health care provider (HCP).”
258. The nurse is performing an assessment on a pregnant client in the last trimester with a diagnosis of severe preeclampsia. The nurse reviews the assessment findings and determines that which finding is most closely associated with a complication of this diagnosis?
1. Enlargement of the breasts
 2. Complaints of feeling hot when the room is cool
 3. Periods of fetal movement followed by quiet periods
 4. Evidence of bleeding, such as in the gums, petechiae, and purpura
- ❖ 259. The nurse in a maternity unit is reviewing the clients’ records. Which clients should the nurse identify as being at the most risk for developing disseminated intravascular coagulation (DIC)? Select all that apply.
- 1. A primigravida with mild preeclampsia
 - 2. A primigravida who delivered a 10-lb infant 3 hours ago
 - 3. A gravida II who has just been diagnosed with dead fetus syndrome
 - 4. A gravida IV who delivered 8 hours ago and has lost 500 mL of blood
 - 5. A primigravida at 29 weeks of gestation who was recently diagnosed with severe preeclampsia

- ❖ 260. The home care nurse is monitoring a pregnant client with gestational hypertension who is at risk for preeclampsia. At each home care visit, the nurse assesses the client for which classic signs of preeclampsia? Select all that apply.
- 1. Proteinuria
 - 2. Hypertension
 - 3. Low-grade fever
 - 4. Generalized edema
 - 5. Increased pulse rate
 - 6. Increased respiratory rate
261. The nurse is assessing a pregnant client with type 1 diabetes mellitus about her understanding regarding changing insulin needs during pregnancy. The nurse determines that further teaching is needed if the client makes which statement?
1. “I will need to increase my insulin dosage during the first 3 months of pregnancy.”
 2. “My insulin dose will likely need to be increased during the second and third trimesters.”
 3. “Episodes of hypoglycemia are more likely to occur during the first 3 months of pregnancy.”
 4. “My insulin needs should return to prepregnant levels within 7 to 10 days after birth if I am bottle-feeding.”
262. A pregnant client reports to a health care clinic, complaining of loss of appetite, weight loss, and fatigue. After assessment of the client, tuberculosis is suspected. A sputum culture is obtained and identifies *Mycobacterium tuberculosis*. Which instruction should the nurse include in the client’s teaching plan?
1. Therapeutic abortion is required.
 2. Isoniazid plus rifampin will be required for 9 months.
 3. She will have to stay at home until treatment is completed.
 4. Medication will not be started until after delivery of the fetus.
263. The nurse is providing instructions to a pregnant client with a history of cardiac disease regarding appropriate dietary measures. Which statement, if made by the client, indicates an understanding of the information provided by the nurse?
1. “I should increase my sodium intake during pregnancy.”
 2. “I should lower my blood volume by limiting my fluids.”
 3. “I should maintain a low-calorie diet to prevent any weight gain.”
 4. “I should drink adequate fluids and increase my intake of high-fiber foods.”
- ❖ 264. The clinic nurse is performing a psychosocial assessment of a client who has been told that she is pregnant. Which assessment findings indicate to the nurse that the client is at risk for contracting human immunodeficiency virus (HIV)? Select all that apply.
- 1. The client has a history of intravenous drug use.
 - 2. The client has a significant other who is heterosexual.
 - 3. The client has a history of sexually transmitted infections.
 - 4. The client has had one sexual partner for the past 10 years.
 - 5. The client has a previous history of gestational diabetes mellitus.
265. The nurse in a maternity unit is providing emotional support to a client and her significant other who are preparing to be discharged from the hospital after the birth of a dead fetus. Which statement made by the client indicates a component of the normal grieving process?
1. “We want to attend a support group.”
 2. “We never want to try to have a baby again.”
 3. “We are going to try to adopt a child immediately.”
 4. “We are okay, and we are going to try to have another baby immediately.”
266. The nurse evaluates the ability of a hepatitis B–positive mother to provide safe bottle-feeding to her newborn during postpartum hospitalization. Which maternal action best exemplifies the mother’s knowledge of potential disease transmission to the newborn?
1. The mother requests that the window be closed before feeding.
 2. The mother holds the newborn properly during feeding and burping.
 3. The mother tests the temperature of the formula before initiating feeding.
 4. The mother washes and dries her hands before and after self-care of the perineum and asks for a pair of gloves before feeding.
267. A client in the first trimester of pregnancy arrives at a health care clinic and reports that she has been experiencing vaginal bleeding. A threatened abortion is suspected, and the nurse instructs the client regarding management of care. Which statement made by the client indicates a need for further instruction?
1. “I will watch for the evidence of the passage of tissue.”
 2. “I will maintain strict bed rest throughout the remainder of the pregnancy.”

3. “I will count the number of perineal pads used on a daily basis and note the amount and color of blood on the pad.”
 4. “I will avoid sexual intercourse until the bleeding has stopped, and for 2 weeks following the last evidence of bleeding.”
- ❖ 268. The nurse is planning to admit a pregnant client who is obese. In planning care for this client, which potential client needs should the nurse anticipate? Select all that apply.

- 1. Bed rest as a necessary preventive measure may be prescribed.
- 2. Routine administration of subcutaneous heparin may be prescribed.
- 3. An overbed lift may be necessary if the client requires a cesarean section.
- 4. Less frequent cleansing of a cesarean incision, if present, may be prescribed.
- 5. Thromboembolism stockings or sequential compression devices may be prescribed.

ANSWERS

254. 1

Rationale: Perinatal transmission of HIV can occur during the antepartum period, during labor and birth, or in the postpartum period if the mother is breast-feeding. Clients who have HIV are advised not to breast-feed. There is no physiological reason why the newborn needs to be fed by nasogastric tube. Test-Taking Strategy: Use knowledge regarding the transmission of HIV. Eliminate options 3 and 4 first because these options are **comparable or alike** in that they both address breast-feeding. From the remaining options, select the correct option, knowing that it is unnecessary to feed the newborn by nasogastric tube.

Review: Feeding options for a newborn with a mother who has **human immunodeficiency virus (HIV)**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Maternity—Postpartum

Priority Concepts: Client Education; Infection

Reference: Lowdermilk et al. (2016), p. 603.

255. 4

Rationale: If the client complains of a headache and blurred vision, the HCP should be notified, because these are signs of worsening preeclampsia. Options 1, 2, and 3 are normal findings.

Test-Taking Strategy: Note the word worsening in the question. Eliminate options 1, 2, and 3 because these options are **comparable or alike** and indicate normal findings.

Review: Signs of worsening **preeclampsia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Antepartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), pp. 654, 660.

256. 1

Rationale: When a loss or death occurs, the nurse should ensure that parents have been honestly told about the situation by their health care provider or others on the health care team. It is important for the nurse to be with the parents at this time and to use therapeutic communication techniques. The nurse

must also consider cultural and religious practices and beliefs. The correct option provides a supportive, giving, and caring response. Options 2, 3, and 4 are blocks to communication and devalue the parents' feelings.

Test-Taking Strategy: Use knowledge of **therapeutic communication techniques** to answer the question. The correct option is the only option that reflects use of **therapeutic communication techniques**.

Review: **Grief** associated with **perinatal death**

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Caring

Content Area: Maternity—Postpartum

Priority Concepts: Communication; Coping

Reference: Lowdermilk et al. (2016), pp. 911, 918.

257. 3

Rationale: Exercise is safe for a client with gestational diabetes mellitus and is helpful in lowering the blood glucose level. Dietary modifications are the mainstay of treatment, and the client is placed on a standard diabetic diet. Many clients are taught to perform blood glucose monitoring. If the client is not performing the blood glucose monitoring at home, it is performed at the clinic or HCP's office. Signs of infection need to be reported to the HCP.

Test-Taking Strategy: Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and the need to select an incorrect client statement. Noting these strategic words and the **closed-ended word** avoid in the correct option will assist in answering the question.

Review: Teaching points for **gestational diabetes**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Maternity—Antepartum

Priority Concepts: Client Education; Glucose Regulation

Reference: Lowdermilk et al. (2016), p. 703.

258. 4

Rationale: Severe preeclampsia can trigger disseminated intravascular coagulation (DIC) because of the widespread damage to vascular integrity. Bleeding is an early sign of DIC and should be reported to the health care provider if noted on assessment. Options 1, 2, and 3 are normal occurrences in the last trimester of pregnancy.

Test-Taking Strategy: Note the **strategic word**, most. Focus on the **subject**, a complication of severe preeclampsia. Eliminate options 1, 2, and 3 because they are **comparable or alike** and are normal occurrences in the last trimester of pregnancy. Review: Assessment findings in **disseminated intravascular coagulation (DIC)**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Antepartum
 Priority Concepts: Clinical Judgment; Clotting
 Reference: Lowdermilk et al. (2016), pp. 663, 685.

❖ 259. 3, 5

Rationale: In a pregnant client, DIC is a condition in which the clotting cascade is activated, resulting in the formation of clots in the microcirculation. Dead fetus syndrome is considered a risk factor for DIC. Severe preeclampsia is considered a risk factor for DIC; a mild case is not. Delivering a large newborn is not considered a risk factor for DIC. Hemorrhage is a risk factor for DIC; however, a loss of 500 mL is not considered hemorrhage. Test-Taking Strategy: Note the **strategic word**, most. Focus on the **subject**, the client at most risk for DIC. Think about the pathophysiology associated with DIC and recall that dead fetus syndrome is a risk factor. This will direct you to the correct option.

Review: Risk factors for **disseminated intravascular coagulation**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Analysis
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Clotting
 Reference: Lowdermilk et al. (2016), pp. 662, 685.

❖ 260. 1, 2

Rationale: The two classic signs of preeclampsia are hypertension and proteinuria. A low-grade fever, increased pulse rate, or increased respiratory rate is not associated with preeclampsia. Generalized edema may occur, but is no longer included as a classic sign of preeclampsia because it can occur in many conditions.

Test-Taking Strategy: Focus on the **subject**, the classic signs of preeclampsia. Thinking about the pathophysiology associated with preeclampsia will direct you to the correct options. Remember that the two classic signs of preeclampsia are hypertension and proteinuria.

Review: Signs of **preeclampsia**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Antepartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), p. 654.

261. 1

Rationale: Insulin needs decrease in the first trimester of pregnancy because of increased insulin production by the pancreas and increased peripheral sensitivity to insulin. The statements in options 2, 3, and 4 are accurate and signify that the client understands control of her diabetes during pregnancy.

Test-Taking Strategy: Note the **strategic words**, further teaching is needed. These words indicate a **negative event query**

and the need to select an incorrect client statement. Eliminate options 2, 3, and 4 because they are **comparable or alike** and are accurate statements. Remember that insulin needs decrease in the first trimester of pregnancy.

Review: Insulin needs of the **pregnant client with diabetes mellitus**

Level of Cognitive Ability: Evaluating
 Client Needs: Physiological Integrity
 Integrated Process: Teaching and Learning
 Content Area: Maternity—Antepartum
 Priority Concepts: Client Education; Glucose Regulation
 Reference: Lowdermilk et al. (2016), pp. 694–695.

262. 2

Rationale: More than 1 medication may be used to prevent the growth of resistant organisms in a pregnant client with tuberculosis. Treatment must continue for a prolonged period. The preferred treatment for the pregnant client is isoniazid plus rifampin daily for 9 months. Ethambutol is added initially if medication resistance is suspected. Pyridoxine (vitamin B₆) often is administered with isoniazid to prevent fetal neurotoxicity. The client does not need to stay at home during treatment, and therapeutic abortion is not required.

Test-Taking Strategy: Focus on the **subject**, therapeutic management for a client with tuberculosis. Recalling the pathophysiology associated with tuberculosis and its treatment will assist in eliminating options 1, 3, and 4.

Review: Treatment measures for the **pregnant client with tuberculosis**
 Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Teaching and Learning
 Content Area: Maternity—Antepartum
 Priority Concepts: Client Education; Infection
 Reference: McKinney et al. (2013), p. 631.

263. 4

Rationale: Constipation can cause the client to use the Valsalva maneuver. The Valsalva maneuver should be avoided in clients with cardiac disease because it can cause blood to rush to the heart and overload the cardiac system. Constipation can be prevented by the addition of fluids and a high-fiber diet. A low-calorie diet is not recommended during pregnancy and could be harmful to the fetus. Sodium should be restricted as prescribed by the health care provider because excess sodium would cause an overload to the circulating blood volume and contribute to cardiac complications. Diets low in fluid can cause a decrease in blood volume, which could deprive the fetus of nutrients.

Test-Taking Strategy: Focus on the **subject**, the pregnant client with heart disease. Think about the physiology of the cardiac system, maternal and fetal needs, and the factors that increase the workload on the heart. This will direct you to the correct option.

Review: Nursing measures for the **pregnant client with heart disease**

Level of Cognitive Ability: Evaluating
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Evaluation
 Content Area: Maternity—Antepartum
 Priority Concepts: Clinical Judgment; Perfusion
 References: Lowdermilk et al. (2016), p. 352; McKinney et al. (2013), p. 619.

❖ 264. 1, 3

Rationale: HIV is transmitted by intimate sexual contact and the exchange of body fluids, exposure to infected blood, and passage from an infected woman to her fetus. Clients who fall into the high-risk category for HIV infection include individuals who have used intravenous drugs, individuals who experience persistent and recurrent sexually transmitted infections, and individuals who have a history of multiple sexual partners. Gestational diabetes mellitus does not predispose the client to HIV. A client with a heterosexual partner, particularly a client who has had only one sexual partner in 10 years, does not have a high risk for contracting HIV.

Test-Taking Strategy: Focus on the **subject**, risk factors for HIV. Recalling that exchange of blood and body fluids places the client at high risk for HIV infection will direct you to the correct option.

Review: Risk factors associated with **human immunodeficiency virus (HIV)**

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Antepartum

Priority Concepts: Infection; Sexuality

Reference: Lowdermilk et al. (2016), p. 161.

265. 1

Rationale: A support group can help the parents to work through their pain by nonjudgmental sharing of feelings. The correct option identifies a statement that indicates positive, normal grieving. Although the other options may indicate reactions of the client and significant other, they are not specifically a part of the normal grieving process.

Test-Taking Strategy: Read all options carefully before selecting an answer and focus on the **subject**, the normal grieving process. Note that options 2, 3, and 4 are **comparable or alike** in that they relate to childbearing.

Review: **Normal grieving process**

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Caring

Content Area: Maternity—Postpartum

Priority Concepts: Coping; Family Dynamics

Reference: Lowdermilk et al. (2016), p. 918.

266. 4

Rationale: Hepatitis B virus is highly contagious and is transmitted by direct contact with blood and body fluids of infected persons. The rationale for identifying childbearing clients with this disease is to provide adequate protection of the fetus and the newborn, to minimize transmission to other individuals, and to reduce maternal complications. The correct option provides the best evaluation of maternal understanding of disease transmission. Option 1 will not affect disease transmission since hepatitis B does not spread through airborne transmission. Options 2 and 3 are appropriate feeding techniques for bottle-feeding, but do not minimize disease transmission for hepatitis B.

Test-Taking Strategy: Note the **strategic word**, best. Focus on the **subject**, disease transmission to the newborn. This focus will direct you to the correct option.

Review: Measures to prevent transmission of **hepatitis**

267. 2

Rationale: Strict bed rest throughout the remainder of the pregnancy is not required for a threatened abortion. The client should watch for the evidence of the passage of tissue. The client is instructed to count the number of perineal pads used daily and to note the quantity and color of blood on the pad. The client is advised to curtail sexual activities until bleeding has ceased and for 2 weeks after the last evidence of bleeding or as recommended by the health care provider.

Test-Taking Strategy: Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and the need to select an incorrect client statement. Noting the word strict in the correct option will assist in directing you to this option.

❖ 268. 2, 3, 5

Rationale: The obese pregnant client is at risk for complications such as venous thromboembolism and increased need for cesarean section. Additionally, the obese client requires special considerations pertaining to nursing care. To prevent venous thromboembolism, particularly in the client who required cesarean section, frequent and early ambulation (not bed rest), prior to and after surgery, is recommended. Routine administration of prophylactic pharmacological venous thromboembolism medications such as heparin is also commonly prescribed. An overbed lift may be needed to transfer a client from a bed to an operating table if cesarean section is necessary. Increased monitoring and cleansing of a cesarean incision, if present, will likely be prescribed due to the increased risk for infection secondary to increased abdominal fat. Thromboembolism stockings or sequential compression devices will likely be prescribed because of the client's increased risk of blood clots.

Test-Taking Strategy: Note the **subject**, planning care for the pregnant client who is obese. If you can recall the general complications associated with obesity, this will help you to choose the correct options. Recall that preventive measures need to be taken to prevent blood clots and infection in clients at higher risk for these complications.

Labor and Birth

PRIORITY CONCEPTS Perfusion, Reproduction

CRITICAL THINKING What Should You Do?

A client at 39 weeks of gestation is in active labor. The nurse is monitoring the fetal heart rate and notes that the heart rate is 180 beats/minute, lasting for longer than 10 minutes. What should the nurse do?

Answer located on p. 341.

I. Process of Labor—4 P's

A. Description

1. **Labor:** Coordinated sequence of involuntary, intermittent uterine contractions
2. **Birth:** Actual event of birth

B. Four major factors (4 P's) interact during normal childbirth; the 4 P's are interrelated and depend on each other for a safe birth and are Powers, Passage-way, Passenger, and Psyche.

C. Powers: Uterine contractions

1. Forces acting to expel the fetus
2. Effacement: Shortening and thinning of the cervix during the first stage of labor
3. Dilation: Enlargement of cervical os and cervical canal during the first stage of labor
4. Pushing efforts of mother during the second stage

D. Passageway: The mother's rigid bony pelvis and the soft tissues of the cervix, pelvic floor, **vagina**, and introitus (external opening to the vagina)

E. Passenger: The fetus, membranes, and **placenta**

F. Psyche: A woman's emotional structure that can determine her entire response to labor and influence physiological and psychological functioning; the mother may experience anxiety or fear.

G. Attitude

1. Attitude is the relationship of the fetal body parts to one another.
2. Normal intrauterine attitude is flexion, in which the fetal back is rounded, the head is forward on the chest, and the arms and legs are folded in

against the body. The other attitude, extension, tends to present larger fetal diameters.

H. Lie

1. Relationship of the spine of the fetus to the spine of the mother
2. Longitudinal or vertical (**Fig. 27-1**)
 - a. Fetal spine is parallel to the mother's spine.
 - b. Fetus is in cephalic or breech presentation.
3. Transverse or horizontal (see **Fig. 27-1**)
 - a. Fetal spine is at a right angle, or perpendicular, to the mother's spine.
 - b. Presenting part is the shoulder.
 - c. Delivery by cesarean section is necessary.

I. Presentation

1. Portion of the fetus that enters the pelvic inlet first
2. Cephalic: Head first
 - a. Cephalic is the most common presentation.
 - b. Cephalic presentation has 4 variations: vertex, military, brow, and face.
3. Breech: Buttocks present first.
 - a. Delivery by cesarean section may be required, although vaginal birth is often possible.
 - b. Breech presentation has 3 variations: frank, full (complete), and footling.
4. Shoulder
 - a. Fetus is in a transverse lie, or the arm, back, abdomen, or side could present.
 - b. If the fetus does not spontaneously rotate, or if it is impossible to turn the fetus manually, a cesarean section may need to be performed.

J. Presenting part: The specific fetal structure lying nearest to the cervix

K. Position: Relationship of assigned area of the presenting part or landmark to the maternal pelvis (**Fig. 27-2** and **Box 27-1**)

L. Station

1. The measurement of the progress of descent in centimeters above or below the midplane from the presenting part to the ischial spine
2. Station 0: At ischial spine
3. Minus station: Above ischial spine

FIGURE 27-1 Fetal lie. A, In a longitudinal lie, the long axis of the fetus is parallel to the long axis of the mother. B, In a transverse lie, the long axis of the fetus is at a right angle to the long axis of the mother. The mother's abdomen has a wide, short appearance.

BOX 27-1 Fetal Positions

Vertex Presentations

ROA: Right occipitoanterior
LOA: Left occipitoanterior
ROP: Right occipitoposterior
LOP: Left occipitoposterior
ROT: Right occipitotransverse
LOT: Left occipitotransverse

Face Presentations

RMA: Right mentoanterior
LMA: Left mentoanterior
RMP: Right mentoposterior

Breech Presentations

LSA: Left sacroanterior
LSP: Left sacroposterior

Other Presentations

Brow presentation
Shoulder presentation

FIGURE 27-2 Fetal vertex (occiput) presentations in relation to the front, back, or side of the maternal pelvis.

BOX 27-2 Mechanisms of Labor**Engagement**

- Engagement is the mechanism whereby the fetus nestles into the pelvis.
- Engagement occurs when the presenting part reaches the level of the ischial spines.

Descent

- Descent is the process that the fetal head undergoes as it begins its journey through the pelvis.
- Descent is a continuous process from prior to engagement until birth and is assessed by the measurement called station.

Flexion

- Flexion is a process of nodding of the fetal head forward toward the fetal chest.

Internal Rotation

- Internal rotation of the fetus occurs most commonly from the occipitotransverse position, assumed at engagement into the pelvis, to the occipitoanterior position while continuously descending.

Extension

- Extension enables the head to emerge when the fetus is in a cephalic position.
- Extension begins after the head crowns.
- Extension is complete when the head passes under the symphysis pubis and occiput, and the anterior fontanel, brow, face, and chin pass over the sacrum and coccyx and are over the perineum.

Restitution

- Restitution is realignment of the fetal head with the body after the head emerges.

External Rotation

- The shoulders externally rotate after the head emerges and restitution occurs, so that the shoulders are in the anteroposterior diameter of the pelvis.

Expulsion

- Expulsion is the birth of the entire body.

BOX 27-3 True Labor Versus False Labor**True Labor**

- Contractions occur regularly, become stronger, last longer, and occur closer together.
- Cervical dilation and effacement are progressive.
- The fetus usually becomes engaged in the pelvis and begins to descend.

False Labor

- False labor does not produce dilation, effacement, or descent.
- Contractions are irregular, without progression.
- Activity, such as walking, often relieves false labor.

Example: If a woman has been sleeping and wakes up with contractions, gets up, and moves around, and her contractions become stronger and closer together, this is true labor. If the contractions go away, this is false labor.

4. Plus station: Below ischial spine
5. Engagement: When the widest diameter of the presenting part has passed the inlet; corresponds to a 0 station

II. Mechanisms of Labor (Box 27-2)**A. Assessment**

1. Lightening or dropping: Is also known as engagement and occurs when the fetus descends into the pelvis about 2 weeks before birth; lightening or dropping is most noticeable in first pregnancies.
2. Braxton Hicks contractions increase.
3. The vaginal mucosa is congested, and vaginal discharge increases.
4. Brownish or blood-tinged cervical mucus is passed.

5. Cervix ripens, becomes soft and partly effaced, and may begin to dilate.
6. The mother has a sudden burst of energy, also known as “nesting,” often 24 to 48 hours before onset of labor.
7. Weight loss of 1 to 3 lb results from fluid shifts produced by the changes in progesterone and estrogen levels 24 to 48 hours before the onset of labor.
8. Spontaneous rupture of membranes occurs.
 - a. True labor: Contractions may manifest as back pain in some women; contractions often resemble menstrual cramps during early labor (Box 27-3).
 - b. False labor: Also known as prodromal labor, contractions are felt in the abdomen and groin and may be more annoying than painful (see Box 27-3).

 In true labor, contractions increase in duration and intensity and cervical dilation and effacement are progressive, with engagement and descent of the fetus. In false labor, contractions are irregular and do not produce dilation, effacement, or descent.

III. Leopold's Maneuvers

- A. Description: Methods of palpation to determine presentation and position of the fetus and aid in location of fetal heart sounds
- B. If the head is in the fundus, a hard, round, movable object is felt. The buttocks feel soft and have an irregular shape and are more difficult to move.
- C. The fetus's back, which is a smooth, hard surface, should be felt on 1 side of the abdomen.
- D. Irregular knobs and lumps, which may be the hands, feet, elbows, and knees, are felt on the opposite side of the abdomen.

BOX 27-4 Breathing Techniques**First-Stage Breathing****Cleansing Breath**

Each contraction begins and ends with a deep inspiration and expiration.

Slow-Paced Breathing

Slow-paced breathing promotes relaxation.

Slow-paced breathing is used for as long as possible during labor.

Modified-Paced Breathing

Modified-paced breathing is used when slow-paced breathing is no longer effective.

Breathing is shallow and fast.

Pattern-Paced Breathing

Pattern-paced breathing sometimes is referred to as pant-blow.

After a certain number of breaths (modified-paced breathing), the woman exhales with a slight blow, and then begins modified-paced breathing again.

Breathing to Prevent Pushing

The woman blows repeatedly, using short puffs, when the urge to push is strong.

Second-Stage Breathing

Several variations of breathing can be used in the pushing stage of labor, and the woman may grunt, groan, sigh, or moan as she pushes. Prolonged breath holding while pushing with a closed glottis may result in a decrease in cardiac output. If breath holding while pushing is used, the open glottis method or limiting breath holding to less than 6 to 8 seconds should be done.

IV. Breathing Techniques (Box 27-4)

- Provide a focus during contractions, interfering with pain sensory transmission.
- Promote relaxation and oxygenation.
- Begin with simple breathing patterns and progress to more complex ones as needed.

V. Fetal Monitoring**A. Description**

- The fetal monitor displays the fetal heart rate (FHR).
- The device monitors uterine activity.
- The monitor assesses frequency, duration, and intensity of contractions.
- The monitor assesses FHR in relation to maternal contractions.
- Baseline FHR is measured between contractions; the normal FHR at term is 110 to 160 beats/minute.

B. External fetal monitoring

- External fetal monitoring is noninvasive and is performed with a tocotransducer or Doppler ultrasonic transducer.
- Leopold's maneuvers are performed to determine on which side the fetal back is located, and the ultrasound transducer is placed over this area (fasten with a belt or stocking tubing).
- The tocotransducer is placed over the fundus of the uterus, where contractions feel the strongest (fasten with a belt or stocking tubing).
- The client is allowed to assume a comfortable position, avoiding vena cava compression (maternal supine hypotensive syndrome).
- The preferred position is to have the client lie on her side to increase perfusion.

C. Internal fetal monitoring

- Internal fetal monitoring is invasive and requires rupturing of the membranes and attaching an electrode to the presenting part of the fetus.
- The client must be dilated 2 to 3 cm to perform internal monitoring.

D. Periodic patterns in FHR

- Fetal bradycardia and tachycardia
 - Bradycardia: FHR is less than 110 beats/minute for 10 minutes or longer.
 - Tachycardia: FHR is more than 160 beats/minute for 10 minutes or longer.

! If fetal bradycardia or tachycardia occurs, change the position of the mother, administer oxygen, and assess the mother's vital signs. Notify the health care provider (HCP) as soon as possible.

2. Variability (Box 27-5)

- Fluctuations in baseline FHR
 - Absent or undetected variability is considered nonreassuring.
 - Decreased variability can result from fetal hypoxemia, acidosis, or certain medications.
 - A temporary decrease in variability can occur when the fetus is in a sleep state (sleep states do not usually last longer than 30 minutes).
- Accelerations
 - Brief, temporary increases in FHR of at least 15 beats/minute more than baseline and lasting at least 15 seconds
 - Usually are a reassuring sign, reflecting a responsive, nonacidotic fetus
 - Usually occur with fetal movement
 - May be nonperiodic (having no relation to contractions) or periodic (with contractions)

BOX 27-5 Variability in Fetal Heart Rate

Absent Variability: Undetected variability

Minimal Variability: Greater than undetected but not more than 5 beats/minute

Moderate Variability: Fetal heart rate fluctuations are 6 to 25 beats/minute

Marked Variability: Fetal heart rate fluctuations are greater than 25 beats/minute

- e. May occur with uterine contractions, vaginal examinations, or mild cord compression, or when the fetus is in a breech presentation
4. Early decelerations (Fig. 27-3)
 - a. Early decelerations are decreases in FHR below baseline; the rate at the lowest point of the deceleration usually remains greater than 100 beats/minute.
 - b. Early decelerations occur during contractions as the fetal head is pressed against the mother's pelvis or soft tissues, such as the cervix, and return to baseline FHR by the end of the contraction.
 - c. Tracing shows a uniform shape and mirror image of uterine contractions.
 - d. Early decelerations are not associated with fetal compromise and require no intervention.
5. Late decelerations (see Fig. 27-3)
 - a. Late decelerations are nonreassuring patterns that reflect impaired placental exchange or uteroplacental insufficiency.

FIGURE 27-3 Deceleration patterns. Top graphs in each pair: Fetal heart rate. Bottom graphs in each pair: Uterine contractions. A, Early decelerations caused by head compression. B, Late decelerations caused by uteroplacental insufficiency. C, Variable decelerations caused by cord compression.

- b. The patterns look similar to early decelerations, but begin well after the contraction begins and return to baseline after the contraction ends.
- c. The degree of decline in FHR from baseline is not related to the amount of uteroplacental insufficiency.

! Interventions for late decelerations include immediately improving placental blood flow and fetal oxygenation.

6. Variable decelerations (see Fig. 27-3).
 - a. Variable decelerations are caused by conditions that restrict flow through the umbilical cord.
 - b. Variable decelerations do not have the uniform appearance of early and late decelerations.
 - c. The shape, duration, and degree of decline below baseline FHR are variable; these fall and rise abruptly with the onset and relief of cord compression.
 - d. Variable decelerations also may be nonperiodic, occurring at times unrelated to contractions.
 - e. Baseline rate and variability are considered when evaluating variable decelerations.
 - f. Variable decelerations are significant when FHR repeatedly declines to less than 70 beats/minute and persists at that level for at least 60 seconds before returning to baseline.

! If variable decelerations occur, discontinue oxytocin if infusing, change the position of the mother, administer oxygen, and assess the mother's vital signs. Notify the HCP. Assist with amnioinfusion (intrauterine instillation of warmed saline to decrease compression on the umbilical cord) if prescribed.

7. Hypertonic uterine activity
 - a. Assessment of uterine activity includes frequency, duration, intensity of contractions, and uterine resting tone; assessment is performed either by palpating by hand or with an internal uterine pressure catheter (IUPC).
 - b. The uterus should relax between contractions for 60 seconds or longer.
 - c. Uterine contraction intensity is about 50 to 75 mm Hg (with an IUPC) during labor and may reach 110 mm Hg with pushing during the second stage.
 - d. The average resting tone is 5 to 15 mm Hg.
 - e. In hypertonic uterine activity, the uterine resting tone between contractions is high, reducing uterine blood flow and decreasing fetal oxygen supply.
8. Nonreassuring FHR patterns (Box 27-6)
9. Interventions for nonreassuring patterns (see Priority Nursing Actions)

BOX 27-6 Nonreassuring Fetal Heart Rate Patterns

- Bradycardia
- Tachycardia
- Late decelerations
- Prolonged decelerations
- Hypertonic uterine activity
- Decreased or absent variability
- Variable decelerations falling to less than 70 beats/minute for longer than 60 seconds

⚡ PRIORITY NURSING ACTIONS**Nonreassuring Fetal Heart Rate Pattern**

1. Identify the cause.
2. Discontinue oxytocin infusion.
3. Change the mother's position.
4. Administer oxygen by face mask at 8 to 10 L/minute and infuse intravenous (IV) fluids as prescribed.
5. Prepare to initiate continuous electronic fetal monitoring with internal devices if not contraindicated.
6. Prepare for cesarean delivery if necessary.
7. Document the event, actions taken, and the mother's response.

Nonreassuring fetal heart rate (FHR) patterns include bradycardia, tachycardia, late decelerations, prolonged decelerations, hypertonic uterine activity, decreased or absent variability, or variable decelerations falling to less than 70 beats/minute for longer than 60 seconds. If a nonreassuring FHR pattern is noted, the health care provider (HCP) or nurse-midwife is notified as soon as possible (the nurse stays with the client and asks another nurse to contact the HCP). The nurse needs to identify the cause of the pattern immediately. This includes checking for a prolapsed umbilical cord and checking maternal vital signs to identify hypotension, hypertension, or fever that can contribute to the fetal response associated with the nonreassuring pattern. If the mother is receiving an oxytocin infusion, it is stopped because oxytocin causes uterine stimulation, which can worsen the nonreassuring pattern. A tocolytic may be prescribed. The mother is repositioned because this may improve placental perfusion (avoid the supine position). Oxygen is administered by face mask at 8 to 10 L/minute to increase maternal blood oxygen saturation, making more oxygen available to the fetus, and IV fluids are infused to expand the mother's blood volume and improve placental perfusion. If not contraindicated, the nurse prepares to initiate continuous electronic fetal monitoring with internal devices. Cesarean delivery may be necessary, and the nurse should prepare for this procedure. Birth preparation should also include neonatal resuscitation. The nurse documents the event, actions taken, the mother's response, and any other pertinent data.

Reference

Lowdermilk et al. (2016), p. 423.

VI. Four Stages of Labor (Table 27-1)**A. Stage 1: Latent phase**

1. Description: Stage 1 is the longest. A labor curve, such as the Friedman curve, may be used to identify whether a woman's cervical dilation is progressing at the expected rate (Fig. 27-4).
2. Assessment
 - a. Cervical dilation is 1 to 4 cm.
 - b. Uterine contractions occur every 15 to 30 minutes, are 15 to 30 seconds in duration, and are of mild intensity.
3. Interventions
 - a. Encourage mother and partner to participate in care.
 - b. Assist with comfort measures, changes of position, and ambulation.
 - c. Keep mother and partner informed of progress.
 - d. Offer fluids and ice chips.
 - e. Encourage voiding every 1 to 2 hours.

B. Stage 1: Active phase

1. Assessment
 - a. Cervical dilation is 4 to 7 cm.
 - b. Uterine contractions occur every 3 to 5 minutes, are 30 to 60 seconds in duration, and are of moderate intensity.
2. Interventions
 - a. Encourage maintenance of effective breathing patterns.
 - b. Provide a quiet environment.
 - c. Keep mother and partner informed of progress.
 - d. Promote comfort with back rubs, sacral pressure, pillow support, and position changes.
 - e. Instruct partner in effleurage (light stroking of abdomen).
 - f. Offer fluids and ice chips and ointment for dry lips.
 - g. Encourage voiding every 1 to 2 hours.

C. Stage 1: Transition phase

1. Assessment
 - a. Cervical dilation is 8 to 10 cm.
 - b. Uterine contractions occur every 2 to 3 minutes, are 45 to 90 seconds in duration, and are of strong intensity.
2. Interventions
 - a. Encourage rest between contractions.
 - b. Wake mother at beginning of contraction so she can begin breathing pattern.
 - c. Keep mother and partner informed of progress.
 - d. Provide privacy.
 - e. Offer fluids and ice chips and ointment for dry lips.
 - f. Encourage voiding every 1 to 2 hours.

D. Interventions throughout stage 1

1. Monitor maternal vital signs.
2. Monitor FHR via ultrasound Doppler, fetoscope, or electronic fetal monitor.

- e. Monitor uterine contractions by palpation or tocodynamometer, determining frequency, duration, and intensity.
 - f. Provide mother with encouragement and praise and provide for rest between contractions.
 - g. Keep mother and partner informed of progress.
 - h. Maintain privacy.
 - i. Provide ice chips and ointment for dry lips.
 - j. Assist mother into a position that promotes comfort and facilitates pushing efforts, such as lithotomy, semisitting, kneeling, side-lying, or squatting.
 - k. Monitor for signs of approaching birth, such as perineal bulging or visualization of the fetal head.
 - l. Prepare for birth (expulsion of the fetus).
- F. Stage 3
- 1. Assessment
 - a. Contractions occur until the placenta is expelled.
 - b. Placental separation and expulsion occur.
 - c. Expulsion of the placenta occurs 5 to 30 minutes after the birth of the infant.
 - d. Schultze mechanism: Center portion of the placenta separates first, and its shiny fetal surface emerges from the vagina.
 - e. Duncan mechanism: Margin of the placenta separates, and the dull, red, rough maternal surface emerges from the vagina first.
 - f. Method of placental presentation is of no clinical significance.
 - 2. Interventions
 - a. Assess maternal vital signs.
 - b. Assess uterine status.
 - c. Provide parents with an explanation regarding expulsion of the placenta.
 - d. After expulsion of the placenta, uterine fundus remains firm and is located 2 fingerbreadths below the umbilicus.
 - e. Examine placenta for cotyledons and membranes to verify that it is intact.
 - f. Assess mother for shivering and provide warmth.
 - g. Promote parental-neonatal attachment.
- G. Stage 4
- 1. Description: Period 1 to 4 hours after birth
 - 2. Assessment
 - a. Blood pressure returns to prelabor level.
 - b. Pulse is slightly lower than during labor.
 - c. Fundus remains contracted, in the midline, 1 or 2 fingerbreadths below the umbilicus.

 **Monitor lochia discharge. Lochia may be moderate in amount and red in color in stage 4.**

- 3. Interventions
 - a. Perform maternal assessments every 15 minutes for 1 hour, every 30 minutes for 1 hour, and hourly for 2 hours (or as per agency policy).
 - b. Provide warm blankets.
 - c. Apply ice packs to the perineum.
 - d. Massage the uterus if needed, and teach the mother to massage the uterus.
 - e. Provide breast-feeding support as needed.
 - f. See [Chapter 31](#) for information on caring for the **newborn**.

VII. Anesthesia

A. Local anesthesia

- 1. Local anesthesia is used for blocking pain during episiotomy.
- 2. Local anesthesia is administered just before the birth of the infant.
- 3. The anesthetic has no effect on the fetus.

B. Lumbar epidural block

- 1. Injection site is in epidural space at L3 to L4.
- 2. The block is administered after labor is established or just before a scheduled cesarean birth.
- 3. The anesthetic relieves pain from contractions and numbs the vagina and perineum.
- 4. The block may cause hypotension, bladder distention, and a prolonged second stage.
- 5. The anesthetic does not cause a headache because the dura mater is not penetrated.
- 6. Assess maternal blood pressure and assess bladder frequently.
- 7. Maintain the mother in a side-lying position or place a rolled blanket beneath the right hip to displace the uterus from the vena cava.
- 8. Administer intravenous (IV) fluids as prescribed.
- 9. Increase fluids as prescribed if hypotension occurs.
- 10. Observe for any adverse effects from opioid epidurals, such as nausea and vomiting, pruritus, or respiratory depression.

C. Intrathecal opioid analgesics

- 1. The medication is injected into the subarachnoid space and has a rapid onset of action.
- 2. It may be used in combination with a lumbar epidural block.

D. Subarachnoid (spinal) block

- 1. Injection site is in the spinal subarachnoid space at L3 to L5.
- 2. The block is administered just before birth.
- 3. The anesthetic relieves uterine and perineal pain and numbs the vagina, perineum, and lower extremities.
- 4. The anesthetic may cause maternal hypotension.
- 5. The anesthetic may cause postpartum headache.

6. The mother must lie flat for 8 to 12 hours after spinal injection.
 7. Administer IV fluids as prescribed.
- E. General anesthesia
1. General anesthesia may be used for some surgical interventions.
 2. The mother is not awake.

 **General anesthesia presents a maternal danger of respiratory depression, vomiting, and aspiration.**

VIII. Obstetrical Procedures

A. Bishop score (Table 27-2)

1. The Bishop score is used to determine maternal readiness for labor and evaluates cervical status and fetal position.
2. The Bishop score is indicated before the induction of labor.
3. The 5 factors are assigned a score of 0 to 3, and the total score is calculated.
4. A score of 6 or more indicates a readiness for labor induction.

B. Induction

1. Induction is a deliberate initiation of uterine contractions that stimulates labor.
2. Elective induction may be accomplished by oxytocin infusion.
3. Obtain a baseline tracing of uterine contractions and FHR.
4. Increase the IV dosage of oxytocin as prescribed only after assessing contractions, FHR, and maternal blood pressure and pulse.
5. Do not increase the rate of oxytocin when the desired contraction pattern is obtained (contraction frequency of 2 to 3 minutes and lasting 60 seconds).

 **An oxytocin infusion is discontinued if uterine contraction frequency is less than 2 minutes or duration is longer than 90 seconds, or if fetal distress is noted.**

TABLE 27-2 Factors of the Bishop Score

	Score			
	0	1	2	3
Dilation of cervix (cm)	0	1-2	3-4	> 5
Effacement of cervix (%)	0-30	40-50	60-70	> 80
Consistency of cervix	Firm	Medium	Soft	–
Position of cervix	Posterior	Midposition	Anterior	–
Station of presenting part	–3	–2	–1	+1, +2

C. Amniotomy

1. Artificial rupture of the membranes is performed by the HCP or nurse-midwife to stimulate labor.
2. Amniotomy is performed if the fetus is at 0 or a plus station.
3. Amniotomy increases the risk of prolapsed cord and infection.
4. Monitor FHR before and after amniotomy.
5. Record time of amniotomy, FHR, and characteristics of the fluid.
6. Meconium-stained **amniotic fluid** may be associated with fetal distress.
7. Bloody amniotic fluid may indicate abruptio placentae or fetal trauma.
8. An unpleasant odor to amniotic fluid is associated with infection.
9. Polyhydramnios is associated with maternal diabetes and certain congenital disorders.
10. Oligohydramnios is associated with intrauterine growth restriction and congenital disorders.
11. Expect more variable decelerations after rupture of the membranes as a result of possible cord compression during contractions.
12. Limit client activity if prescribed.

D. External version

1. External version is the manipulation of the fetus from an unfavorable presentation into a favorable presentation for birth.
2. External version is indicated for an abnormal presentation that exists after the thirty-fourth week.
3. Monitor vital signs.
4. If the mother is Rh-negative, ensure that Rh_o(D) immune globulin was given at 28 weeks of gestation.
5. Prepare for a nonstress test to evaluate fetal well-being.
6. IV fluids and tocolytic therapy may be administered to relax the uterus and permit easier manipulation of the fetus.
7. Ultrasound is used during the procedure to evaluate fetal position and placental placement and guide direction of the fetus.
8. The abdominal wall is manipulated to direct the fetus into a cephalic presentation if possible.
9. Monitor blood pressure to identify vena cava compression.
10. Monitor for unusual pain.
11. After the procedure, do the following:
 - a. Perform a nonstress test to evaluate fetal well-being.
 - b. Monitor for uterine activity, bleeding, ruptured membranes, and decreased fetal activity.
 - c. With Rh-negative clients, perform Kleihauer-Betke test as prescribed to detect the presence and amount of fetal blood in the maternal circulation and to identify clients who need additional Rh_o(D) immune globulin.

E. Episiotomy

1. An episiotomy is an incision made into the perineum to enlarge the vaginal outlet and facilitate birth.
2. The use of this procedure has declined dramatically in recent years.
3. Check the episiotomy site.
4. Institute measures to relieve pain.
5. Provide ice packs during the first 24 hours.
6. Instruct the client in the use of an ice pack for the first 24 hours, and then sitz baths thereafter.
7. Apply analgesic spray or ointment as prescribed.
8. Provide perineal care, using clean technique.
9. Instruct the client in the proper care of the incision.
10. Instruct the client to dry the perineal area from front to back and to blot the area rather than wipe it.
11. Instruct the client to shower rather than bathe in a tub.
12. Apply a perineal pad without touching the inside surface of the pad.
13. Report any bleeding or discharge from the episiotomy site to the HCP.

F. Forceps delivery

1. Two double-crossed, spoonlike articulated blades are used to assist in the delivery of the fetal head.
2. Reassure the mother and explain the need for forceps.
3. Monitor the mother and fetus during delivery.
4. Check the neonate and mother after delivery for any possible injury.
5. Assist with repair of any lacerations.

G. Vacuum extraction

1. A caplike suction device is applied to the fetal head to facilitate extraction.
2. Suction is used to assist in delivery of the fetal head.
3. Traction is applied during uterine contractions until descent of the fetal head is achieved.
4. The suction device should not be kept in place any longer than 25 minutes.
5. Monitor FHR every 5 minutes if external fetal monitoring is not used.
6. Assess **infant** at birth and throughout the postpartum period for signs of cerebral trauma.
7. Monitor for developing cephalhematoma.
8. Caput succedaneum is normal and resolves in 24 hours.

H. Cesarean delivery

1. Cesarean section is delivery of the fetus usually through a transabdominal, low-segment incision of the uterus.
2. Preoperative
 - a. If planned, prepare the mother and partner.
 - b. If an emergency, quickly explain the need and procedure to the mother and partner.

- c. Obtain informed consent.
 - d. Ensure that the preoperative diagnostic tests are done, including Rh factor determination.
 - e. Prepare to insert an IV line and an indwelling urinary catheter.
 - f. Prepare the abdomen as prescribed.
 - g. Monitor the mother and fetus continuously.
 - h. Provide emotional support.
 - i. Administer preoperative medications as prescribed.
3. Postoperative
 - a. Monitor vital signs.
 - b. Perform a fundal assessment; evaluate incision.
 - c. Provide pain relief.
 - d. Encourage turning, coughing, and deep breathing.
 - e. Encourage ambulation.
 - f. Encourage bonding and attachment with newborn.
 - g. Provide psychological support.
 - h. Monitor for signs of infection and bleeding.
 - i. Burning and pain on urination may indicate a bladder infection.
 - j. A tender uterus and foul-smelling **lochia** may indicate endometritis.
 - k. A productive cough or chills may indicate pneumonia.
 - l. Pain, redness, or edema of an extremity may indicate thrombophlebitis.

CRITICAL THINKING What Should You Do?

Answer: Near or at term, the normal fetal heart rate (FHR) is 110 to 160 beats/minute. If fetal tachycardia or bradycardia occurs, the nurse should change the position of the mother, administer oxygen, and assess the mother's vital signs. In addition, the nurse should notify the health care provider as soon as possible. A FHR of 180 in the early first trimester of pregnancy (6 to 8 weeks) may be a normal finding. Later in pregnancy, it would be deemed as tachycardia.

Reference: Lowdermilk, Perry, Cashion, Alden (2016), p. 422.

PRACTICE QUESTIONS

- ❖ 269. The nurse is caring for a client in labor. Which assessment findings indicate to the nurse that the client is beginning the second stage of labor? Select all that apply.
- 1. The contractions are regular.
 - 2. The membranes have ruptured.
 - 3. The cervix is dilated completely.
 - 4. The client begins to expel clear vaginal fluid.
 - 5. The spontaneous urge to push is initiated from perineal pressure.

270. The nurse in the labor room is caring for a client in the active stage of the first phase of labor. The nurse is assessing the fetal patterns and notes a late deceleration on the monitor strip. What is the most appropriate nursing action?
1. Administer oxygen via face mask.
 2. Place the mother in a supine position.
 3. Increase the rate of the oxytocin intravenous infusion.
 4. Document the findings and continue to monitor the fetal patterns.
271. The nurse is performing an assessment of a client who is scheduled for a cesarean delivery at 39 weeks of gestation. Which assessment finding indicates the need to contact the health care provider (HCP)?
1. Hemoglobin of 11 g/dL (110 mmol/L)
 2. Fetal heart rate of 180 beats/minute
 3. Maternal pulse rate of 85 beats/minute
 4. White blood cell count of 12,000 mm³ (12.0 × 10⁹/L)
- ❖ 272. The nurse is reviewing the record of a client in the labor room and notes that the health care provider has documented that the fetal presenting part is at the -1 station. This documented finding indicates that the fetal presenting part is located at which area? Refer to figure.
- 
1. 1
2. 2
3. 3
4. 4
- ❖ 273. A client arrives at a birthing center in active labor. Following examination, it is determined that her membranes are still intact and she is at a -2 station. The health care provider prepares to perform an amniotomy. What will the nurse relay to the client as the most likely outcomes of the amniotomy? Select all that apply.
- 1. Less pressure on her cervix
 - 2. Decreased number of contractions
 - 3. Increased efficiency of contractions
 - 4. The need for increased maternal blood pressure monitoring
 - 5. The need for frequent fetal heart rate monitoring to detect the presence of a prolapsed cord
274. The nurse is monitoring a client in labor. The nurse suspects umbilical cord compression if which is noted on the external monitor tracing during a contraction?
1. Variability
 2. Accelerations
 3. Early decelerations
 4. Variable decelerations
275. A client in labor is transported to the delivery room and prepared for a cesarean delivery. After the client is transferred to the delivery room table, the nurse should place the client in which position?
1. Supine position with a wedge under the right hip
 2. Trendelenburg's position with the legs in stirrups
 3. Prone position with the legs separated and elevated
 4. Semi-Fowler's position with a pillow under the knees
276. The nurse is monitoring a client in active labor and notes that the client is having contractions every 3 minutes that last 45 seconds. The nurse notes that the fetal heart rate between contractions is 100 beats/minute. Which nursing action is most appropriate?
1. Notify the health care provider (HCP).
 2. Continue monitoring the fetal heart rate.
 3. Encourage the client to continue pushing with each contraction.
 4. Instruct the client's coach to continue to encourage breathing techniques.
277. The nurse is caring for a client in labor and is monitoring the fetal heart rate patterns. The nurse notes the presence of episodic accelerations on the electronic fetal monitor tracing. Which action is most appropriate?
1. Notify the health care provider of the findings.
 2. Reposition the mother and check the monitor for changes in the fetal tracing.
 3. Take the mother's vital signs and tell the mother that bed rest is required to conserve oxygen.
 4. Document the findings and tell the mother that the pattern on the monitor indicates fetal well-being.
278. The nurse is admitting a pregnant client to the labor room and attaches an external electronic fetal monitor to the client's abdomen. After attachment of the electronic fetal monitor, what is the next nursing action?
1. Identify the types of accelerations.
 2. Assess the baseline fetal heart rate.
 3. Determine the intensity of the contractions.
 4. Determine the frequency of the contractions.

279. The nurse is reviewing true and false labor signs with a multiparous client. The nurse determines that the client understands the signs of true labor if she makes which statement?
1. “I won’t be in labor until my baby drops.”
 2. “My contractions will be felt in my abdominal area.”
 3. “My contractions will not be as painful if I walk around.”
 4. “My contractions will increase in duration and intensity.”
280. Which assessment following an amniotomy should be conducted first?
1. Cervical dilation
 2. Bladder distention
 3. Fetal heart rate pattern
 4. Maternal blood pressure
281. The nurse has been working with a laboring client and notes that she has been pushing effectively for 1 hour. What is the client’s primary physiological need at this time?
1. Ambulation
 2. Rest between contractions
 3. Change positions frequently
 4. Consume oral food and fluids
282. The nurse is assisting a client undergoing induction of labor at 41 weeks of gestation. The client’s contractions are moderate and occurring every 2 to 3 minutes, with a duration of 60 seconds. An internal fetal heart rate monitor is in place. The baseline fetal heart rate has been 120 to 122 beats/minute for the past hour. What is the priority nursing action?
1. Notify the health care provider.
 2. Discontinue the infusion of oxytocin.
 3. Place oxygen on at 8 to 10 L/minute via face mask.
 4. Contact the client’s primary support person(s) if not currently present.

ANSWERS

❖ 269. 3, 5

Rationale: The second stage of labor begins when the cervix is dilated completely and ends with birth of the neonate. The woman has a strong urge to push in stage 2 from perineal pressure. Options 1, 2, and 4 are not specific assessment findings of the second stage of labor and occur in stage 1.

Test-Taking Strategy: Eliminate options 2 and 4 first because they are **comparable or alike**. From the remaining options, recalling that regular contractions occur before the second stage of labor will direct you to the correct option.

Review: **Stages of labor**

Level of Cognitive Ability: Analyzing

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Reproduction

Reference: Lowdermilk et al. (2016), pp. 376, 454.

270. 1

Rationale: Late decelerations are due to uteroplacental insufficiency and occur because of decreased blood flow and oxygen to the fetus during the uterine contractions. Hypoxemia results; oxygen at 8 to 10 L/minute via face mask is necessary. The supine position is avoided because it decreases uterine blood flow to the fetus. The client should be turned onto her side to displace pressure of the gravid uterus on the inferior vena cava. An intravenous oxytocin infusion is discontinued when a late deceleration is noted. The oxytocin would cause further hypoxemia because of increased uteroplacental insufficiency resulting from stimulation of contractions by this medication. Although the nurse would document the occurrence, option 4 would delay necessary treatment.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Use the **ABCs—airway, breathing, and circulation**—and

knowledge related to the significance of a late deceleration to answer this question.

Review: Nursing actions related to **late decelerations**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), p. 422.

271. 2

Rationale: An normal fetal heart rate is 110 to 160 beats/minute. A fetal heart rate of 180 beats/minute could indicate fetal distress and would warrant immediate notification of the HCP. By full term, a normal maternal hemoglobin range is 11 – 13 g/dL (110 – 130 mmol/L) because of the hemodilution caused by an increase in plasma volume during pregnancy. The maternal pulse rate during pregnancy increases 10 to 15 beats/minute over prepregnancy readings to facilitate increased cardiac output, oxygen transport, and kidney filtration. White blood cell counts in a normal pregnancy begin to increase in the second trimester and peak in the third trimester, with a normal range of 11,000 to 15,000 mm³ (11 to 15 × 10⁹/L), up to 18,000 mm³ (18 × 10⁹/L). During the immediate postpartum period, the white blood cell count may be 25,000 to 30,000 mm³ (25 to 30 × 10⁹/L) because of increased leukocytosis that occurs during delivery.

Test-Taking Strategy: Focus on the **subject**, normal assessment and laboratory findings and those that indicate the need to contact the HCP. Knowledge regarding the normal and abnormal findings in a pregnant client and fetus will direct you to the correct option.

Review: Normal and abnormal **laboratory findings** and **normal fetal heart rate**

❖ 272. 3

Rationale: Station is the measurement of the progress of descent in centimeters above or below the midplane from the presenting part to the ischial spine. It is measured in centimeters, and noted as a negative number above the line and as a positive number below the line. At the negative 1 (–1) station, the fetal presenting part is 1 cm above the ischial spine. Option 1 is at the negative 5 (–5) station and the fetal presenting part is 5 cm above the ischial spine. Option 2 is at the negative 2 (–2) station and the fetal presenting part is 2 cm above the ischial spine. Option 4 is at the positive 3 (+3) and the fetal presenting part is 3 cm below the ischial spine.

Test-Taking Strategy: Recalling that station is measured in centimeters and uses the ischial spine as a reference point will assist in answering this question. **Focus on the data in the question** and note the location of the ischial spine, and that the stations range from –5 cm to +5 cm above or below this reference point.

Review: **Stations** of the **presenting part**
 Level of Cognitive Ability: Analyzing
 Client Needs: Health Promotion and Maintenance

❖ 273. 3, 5

Rationale: Amniotomy (artificial rupture of the membranes) can be used to induce labor when the condition of the cervix is favorable (ripe) or to augment labor if the progress begins to slow. Rupturing of the membranes allows the fetal head to contact the cervix more directly and may increase the efficiency of contractions. Increased monitoring of maternal blood pressure is unnecessary following this procedure. The fetal heart rate needs to be monitored frequently, as there is an increased likelihood of a prolapsed cord with ruptured membranes and a high presenting part.

Test-Taking Strategy: Note the **strategic words**, most likely. Focus on the **subject**, an amniotomy. Recalling that amniotomy is performed to augment labor if the progress begins to slow will direct you to the correct option.

Review: Purpose of **amniotomy**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Maternity—Intrapartum
 Priority Concepts: Client Education; Reproduction
 Reference: Lowdermilk et al. (2016), p. 783.

274. 4

Rationale: Variable decelerations occur if the umbilical cord becomes compressed, reducing blood flow between the placenta and the fetus. Variability refers to fluctuations in the baseline fetal heart rate. Accelerations are a reassuring sign and usually occur with fetal movement. Early decelerations result from pressure on the fetal head during a contraction.

Test-Taking Strategy: Focus on the **subject**, umbilical cord compression. Recalling that variable decelerations occur if

the umbilical cord becomes compressed will direct you to the correct option.

Review: Findings that occur in **umbilical cord compression**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), pp. 421, 423.

275. 1

Rationale: Vena cava and descending aorta compression by the pregnant uterus impedes blood return from the lower trunk and extremities. This leads to decreasing cardiac return, cardiac output, and blood flow to the uterus and subsequently the fetus. The best position to prevent this would be side-lying, with the uterus displaced off the abdominal vessels. Positioning for abdominal surgery necessitates a supine position, however; a wedge placed under the right hip provides displacement of the uterus. Trendelenburg's position places pressure from the pregnant uterus on the diaphragm and lungs, decreasing respiratory capacity and oxygenation. A prone or semi-Fowler's position is not practical for this type of abdominal surgery.

Test-Taking Strategy: Focus on the **subject**, positioning the pregnant woman. Visualizing each of the positions identified in the options and considering the effect that the position may have on the mother and the fetus will direct you to the correct option.

Review: Care for the mother requiring **cesarean delivery**
 Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), p. 791.

276. 1

Rationale: A normal fetal heart rate is 110 to 160 beats/minute, and the fetal heart rate should be within this range between contractions. Fetal bradycardia between contractions may indicate the need for immediate medical management, and the HCP or nurse-midwife needs to be notified. Options 2, 3, and 4 are inappropriate nursing actions in this situation and delay necessary intervention.

Test-Taking Strategy: Note the **strategic words**, most appropriate. **Focus on the data in the question**. Knowledge that the normal fetal heart rate is 110 to 160 beats/minute will assist you to recognize that fetal bradycardia is present.

Review: Expected and unexpected findings during the **labor process**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), p. 411.

277. 4

Rationale: Accelerations are transient increases in the fetal heart rate that often accompany contractions or are caused

by fetal movement. Episodic accelerations are thought to be a sign of fetal well-being and adequate oxygen reserve. Options 1, 2, and 3 are inaccurate nursing actions and are unnecessary. Test-Taking Strategy: Note the **strategic words**, most appropriate. Options 1, 2, and 3 are **comparable or alike** in that they indicate the need for further intervention. Also, knowing that accelerations indicate fetal well-being will direct you to the correct option. Review: The significance of **episodic accelerations**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), p. 420.

278. 2

Rationale: Assessing the baseline fetal heart rate is important so that abnormal variations of the baseline rate can be identified if they occur. The intensity of contractions is assessed by an internal fetal monitor, not an external fetal monitor. Options 1 and 4 are important to assess, but not as the first priority. Fetal heart rate is evaluated by assessing baseline and periodic changes. Periodic changes occur in response to the intermittent stress of uterine contractions and the baseline beat-to-beat variability of the fetal heart rate.

Test-Taking Strategy: Note the **strategic word**, next. Use the **ABCs—airway—breathing—circulation**. Fetal heart rate reflects the ABCs.

Review: Concepts related to **external fetal monitoring**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), pp. 414-416.

279. 4

Rationale: True labor is present when contractions increase in duration and intensity. Lightening or dropping leads to engagement (presenting part reaches the level of the ischial spine) and occurs when the fetus descends into the pelvis about 2 weeks before delivery. Contractions felt in the abdominal area and contractions that ease with walking are signs of false labor.

Test-Taking Strategy: Focus on the **subject**, the signs of true labor. Noting the word true in the question and its relationship to the words increase in duration and intensity in the correct option will direct you to this option.

Review: Signs of **true and false labor**
 Level of Cognitive Ability: Evaluating
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Nursing Process—Evaluation
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Reproduction
 Reference: Lowdermilk et al. (2016), p. 431.

280. 3

Rationale: Fetal heart rate is assessed immediately after amniotomy to detect any changes that may indicate cord compression or prolapse. When the membranes are ruptured,

minimal vaginal examinations would be done because of the risk of infection. Bladder distention or maternal blood pressure would not be the first thing to check after an amniotomy.

Test-Taking Strategy: Note the **strategic word**, first. Because of the risk of a prolapsed cord after an amniotomy, the first action is to check the fetal heart rate for signs of nonreassuring fetal heart rate patterns.

Review: Nursing care following **amniotomy**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), p. 783.

281. 2

Rationale: The birth process expends a great deal of energy, particularly during the transition stage. Encouraging rest between contractions conserves maternal energy, facilitating voluntary pushing efforts with contractions. Uteroplacental perfusion also is enhanced, which promotes fetal tolerance of the stress of labor. Ambulation is encouraged during early labor. Ice chips should be provided. Changing positions frequently is not the primary physiological need. Food and fluids are likely to be withheld at this time.

Test-Taking Strategy: Note the **strategic word**, primary. Also, noting the words pushing effectively will assist in directing you to the correct option.

Review: Care for the client in the **transition stage of labor**
 Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Analysis
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Reproduction
 Reference: Lowdermilk et al. (2016), pp. 386, 405.

282. 2

Rationale: The priority nursing action is to stop the infusion of oxytocin. Oxytocin can cause forceful uterine contractions and decrease oxygenation to the placenta, resulting in decreased variability. After stopping the oxytocin, the nurse should reposition the laboring mother. Notifying the health care provider, applying oxygen, and increasing the rate of the intravenous (IV) fluid (the solution without the oxytocin) are also actions that are indicated in this situation, but not the priority action. Contacting the client's primary support person(s) is not the priority action at this time.

Test-Taking Strategy: Focus on the **strategic word**, priority. Focus on the data in the question and note the relationship of the words undergoing induction and the correct option. Also recall that physiological needs are prioritized over psychosocial needs.

Review: Care to the client receiving **oxytocin**
 Level of Cognitive Ability: Synthesizing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Implementation
 Content Area: Maternity—Intrapartum
 Priority Concepts: Clinical Judgment; Perfusion
 Reference: Lowdermilk et al. (2016), p. 784.

Problems with Labor and Birth

PRIORITY CONCEPTS Reproduction, Safety

CRITICAL THINKING What Should You Do?

The nurse is caring for a pregnant client in labor who suddenly experiences a hypotensive episode. What should the nurse do?

Answer located on p. 351.

I. Premature Rupture of the Membranes

A. Description

1. Premature rupture of the membranes refers to spontaneous rupture of the amniotic membranes before the onset of labor.
2. Gestational age usually determines the plan and intervention.
3. When the rupture of membranes is before term and birth will be delayed, infection becomes a risk.

B. Assessment

1. Presence of fluid pooling in vaginal vault; nitrazine test is positive.
2. Amount, color, consistency, and odor of fluid need to be assessed.
3. Vital signs are monitored; an elevated temperature may indicate infection.
4. Fetal monitoring is necessary; tachycardia in the fetus may indicate maternal infection.

C. Interventions

1. Assist with tests to assess gestational age.
2. Avoid vaginal examinations because of the risk of infection.
3. Monitor maternal and fetal status for signs of compromise or infection.
4. Administer antibiotics as prescribed.

II. Prolapsed Umbilical Cord

- #### A. Description:
- The umbilical cord is displaced between the presenting part and the amnion or protruding through the cervix, causing compression of the cord and compromising fetal circulation (Fig. 28-1).

B. Assessment

1. The client has a feeling that something is coming through the vagina.
2. Umbilical cord is visible or palpable.
3. Fetal heart rate is irregular and slow.
4. Fetal heart monitor shows variable decelerations or bradycardia after rupture of the membranes.
5. If fetal hypoxia is severe, violent fetal activity may occur and then cease.

C. Interventions (see Priority Nursing Actions)

III. Placenta Previa

A. Description

1. Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os (Fig. 28-2).
2. Total (complete): The internal cervical os is covered entirely by the placenta when the cervix is dilated fully.
3. Partial: The lower border of the placenta is within 3 cm of the internal cervical os, but does not fully cover it.
4. Marginal (low-lying): The placenta is implanted in the lower uterus, but its lower border is more than 3 cm from the internal cervical os.
5. Management depends on the classification of the placenta previa and gestational age of the fetus.

B. Assessment

1. Sudden onset of painless, bright red vaginal bleeding occurs in the last half of pregnancy.
2. Uterus is soft, relaxed, and nontender.
3. Fundal height may be more than expected for gestational age.

C. Interventions

1. Monitor maternal vital signs, fetal heart rate, and fetal activity.
2. Prepare for ultrasound to confirm the diagnosis.
3. Vaginal examinations or any other actions that would stimulate uterine activity are avoided.
4. Maintain bed rest in a side-lying position as prescribed.

⚡ PRIORITY NURSING ACTIONS

Umbilical Cord Prolapse

1. Elevate the fetal presenting part that is lying on the cord by applying finger pressure with a gloved hand.
2. Place the client into extreme Trendelenburg or modified Sims' position or a knee-chest position.
3. Administer oxygen, 8 to 10 L/minute, by face mask to the client.
4. Monitor fetal heart rate and assess the fetus for hypoxia.
5. Prepare to start intravenous fluids or increase the rate of administration of an existing solution.
6. Prepare for immediate birth.
7. Document the event, actions taken, and the client's response.

If umbilical cord prolapse occurs, the cord is lying alongside or below the presenting part of the fetus and can be seen or felt in or protruding from the vagina. The nurse stays with the client and asks another nurse to call the health care provider immediately. The nurse must relieve cord pressure immediately so that the fetus receives adequate oxygenation. The nurse can

relieve cord pressure by elevating the fetal presenting part that is lying on the cord; the nurse does this by quickly gloving the hand and inserting 2 fingers into the vagina to the cervix and exerting upward pressure on the presenting part. The nurse also relieves cord pressure by placing the client into an extreme Trendelenburg or modified Sims' position or a knee-chest position (a rolled towel is placed under the client's hip). The nurse administers oxygen, 8 to 10 L/minute, by face mask to the client, monitors the fetal heart rate and fetal heart rate patterns, and assesses the fetus for hypoxia. The client is prepared for immediate birth (vaginal or cesarean). The nurse documents the event, actions taken, the client's response, and any additional pertinent information. The nurse never attempts to push the cord into the uterus. If the umbilical cord is protruding from the vagina, the cord is wrapped loosely in a sterile towel saturated with warm sterile normal saline.

Reference

Lowdermilk et al. (2016), pp. 797–798.

FIGURE 28-1 Prolapse of umbilical cord. Note the pressure of the presenting part on the umbilical cord, which endangers fetal circulation. A, Occult (hidden) prolapse of cord. B, Complete prolapse of cord. Membranes are intact. C, Cord presenting in front of the fetal head may be seen in the vagina. D, Frank breech presentation with prolapsed cord.

FIGURE 28-2 Three classifications of placenta previa.

5. Monitor amount of bleeding (treat signs of shock).
6. Administer intravenous (IV) fluids, blood products, or tocolytic medications as prescribed; Rh_o(D) immune globulin may be prescribed.
7. If bleeding is heavy, a cesarean delivery may be performed.

! Vaginal exams are contraindicated if the client is suspected of having or has a known placenta previa.

IV. Abruptio Placentae

A. Description: Premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered (Fig. 28-3)

B. Assessment

1. Dark red vaginal bleeding. If the bleeding is high in the uterus or is minimal, there can be an absence of visible blood.
2. Uterine pain or tenderness or both
3. Uterine rigidity
4. Severe abdominal pain
5. Signs of fetal distress
6. Signs of maternal shock if bleeding is excessive

C. Interventions

1. Monitor maternal vital signs and fetal heart rate.
2. Assess for excessive vaginal bleeding, abdominal pain, and an increase in fundal height.
3. Maintain bed rest; administer oxygen, IV fluids, and blood products as prescribed.
4. Place the client in Trendelenburg position if indicated to decrease the pressure of the fetus on the placenta, or place in the lateral position with the head of the bed flat if hypovolemic shock occurs.
5. Monitor and report any uterine activity.
6. Prepare for delivery of the fetus as quickly as possible, with vaginal delivery preferable if the fetus is healthy and stable and the presenting part is in the pelvis; emergency cesarean delivery is performed if the fetus is alive but shows signs of distress.
7. Monitor for signs of disseminated intravascular coagulation in the postpartum period.

! Know the differences between placenta previa and abruptio placentae. In placenta previa, there is painless, bright red vaginal bleeding, and the uterus is soft, relaxed, and nontender. In abruptio placentae, there is dark red vaginal bleeding, uterine pain or tenderness or both, and uterine rigidity.

V. Supine Hypotension (Vena Cava Syndrome)

A. Description

1. Supine hypotension (also known as vena cava syndrome) occurs when the venous return to the heart is impaired by the weight of the uterus on the vena cava.

FIGURE 28-3 Types of abruptio placentae.

2. The syndrome results in partial occlusion of the vena cava and aorta and in reduced cardiac return, cardiac output, and blood pressure.

B. Assessment

1. Pallor
2. Faintness, dizziness, breathlessness
3. Tachycardia, hypotension
4. Sweating, cool and damp skin
5. Fetal distress

C. Interventions

1. Position the client on her side to shift the weight of the fetus off the vena cava until the client's signs and symptoms subside and vital signs stabilize.
2. Monitor vital signs and fetal heart rate.

! To prevent supine hypotension, avoid the supine position; position the client by placing a pillow or wedge under the client's hip to displace the gravid uterus off the vena cava.

VI. Placental Abnormalities

A. Description: Placenta accreta is an abnormally adherent placenta; placenta increta occurs when the placenta penetrates the uterine muscle itself; placenta percreta occurs when the placenta goes all the way through the uterus.

B. Assessment: May cause hemorrhage immediately after birth because the placenta does not separate cleanly

C. Intervention

1. Monitor for hemorrhage and shock.
2. Prepare the client for a hysterectomy if a large portion of the placenta is abnormally adherent.

VII. Preterm Labor

A. Description

1. Preterm labor occurs after the twentieth week but before the thirty-seventh week of gestation.
2. Risk factors include a history of medical conditions; present and past obstetric problems; infection; and social and environmental factors, including substance abuse.
3. Additional risk factors include a multifetal pregnancy, which contributes to overdistention of the uterus; anemia, which decreases oxygen supply to the uterus; and age younger than 18 years or first pregnancy and age older than 40 years.

B. Assessment

1. Uterine contractions (painful or painless)
2. Abdominal cramping (may be accompanied by diarrhea)
3. Low back pain
4. Pelvic pressure or heaviness
5. Change in character and amount of usual discharge—may be thicker or thinner, bloody, brown or colorless, odorous
6. Rupture of amniotic membranes
7. Presence of fetal fibronectin in cervical canal
8. Shortening of cervical length

C. Interventions

1. Focus on stopping the labor: Identify and treat infection, restrict activity, and ensure hydration.
2. Maintain bed rest and a lateral position.
3. Monitor fetal status.
4. Administer fluids.
5. Administer medications as prescribed and monitor for side effects of tocolytics (see [Table 32-1](#) for a description of medications used to treat preterm labor).
6. Use of 17 alpha-hydroxyprogesterone caproate known as 17P injection to decrease risk of preterm delivery.

VIII. Precipitous Labor and Delivery

A. Description: Labor lasting less than 3 hours

B. Interventions

1. Have a precipitous delivery tray available (hemostats, scissors, and cord clamp).
2. Stay with the client at all times.
3. Provide emotional support and keep the client calm.
4. Encourage the client to pant between contractions.

5. Prepare for rupturing membranes when the head crowns, if they are not already ruptured.

6. Do not try to prevent the fetus from being delivered.

7. If delivery is necessary before the arrival of the health care provider, do the following:

- a. Apply gentle pressure to the fetal head upward toward the vagina to prevent damage to the fetal head and vaginal lacerations; support the perineal area. Both actions constitute the Ritgen maneuver.
- b. Support the infant's body during delivery.
- c. Deliver the infant between contractions, checking for the cord around the neck.
- d. Use restitution to deliver the posterior shoulder.
- e. Use gentle downward pressure to move the anterior shoulder under the pubic symphysis.
- f. Bulb suction the infant's mouth first and then suction each naris.
- g. Dry and cover the infant to keep the body warm.
- h. Allow the placenta to separate naturally.
- i. Place the infant on the mother's abdomen or breast to induce uterine contractions.

IX. Dystocia

A. Description

1. Dystocia is difficult labor that is prolonged or more painful.
2. Occurs because of problems caused by uterine contractions, the fetus, or the bones and tissues of the maternal pelvis.
3. The fetus may be excessively large, malpositioned, or in an abnormal presentation.
4. Contractions may be hypotonic or hypertonic.
5. Hypotonic contractions are short, irregular, and weak; amniotomy and oxytocin infusion may be treatment measures.
6. Hypertonic contractions are painful, occur frequently, and are uncoordinated; treatment depends on the cause and includes pain relief measures and rest.
7. Can result in maternal dehydration, infection, fetal injury, or death.

B. Assessment

1. Excessive abdominal pain
2. Abnormal contraction pattern
3. Fetal distress
4. Maternal or fetal tachycardia
5. Lack of progress in labor

C. Interventions

1. Assess fetal heart rate; monitor for fetal distress.
2. Monitor uterine contractions.
3. Monitor maternal temperature and heart rate.
4. Assist with pelvic examination, measurements, ultrasound, and other procedures.

5. Administer prophylactic antibiotics as prescribed to prevent infection.
6. Administer IV fluids as prescribed.
7. Monitor intake and output.
8. Maintain hydration.
9. Instruct the client in breathing techniques and relaxation exercises.
10. Perform fetal monitoring if oxytocin is prescribed for hypotonic uterine contractions (oxytocin is not prescribed for hypertonic uterine contractions).
11. Monitor color of **amniotic fluid**.
12. Provide rest and comfort as with a normal delivery, such as back rubs and position changes.
13. Assess client's fatigue and pain, and administer sedatives and pain medications as prescribed.
14. Assess for prolapse of the cord after membranes rupture.

X. Amniotic Fluid Embolism

A. Description

1. Amniotic fluid embolism is the escape of amniotic fluid into the maternal circulation.
2. The debris-containing amniotic fluid deposits in the pulmonary arterioles and is usually fatal to the mother.

B. Assessment

1. Abrupt onset of respiratory distress and chest pain
2. Cyanosis
3. Fetal bradycardia and distress if delivery has not occurred at the time of the embolism

C. Interventions

1. Institute emergency measures to maintain life.
2. Administer oxygen, 8 to 10 L/minute, by face mask or resuscitation bag delivering 100% oxygen.
3. Prepare for intubation and mechanical ventilation.
4. Position the client on her side.
5. Administer IV fluids, blood products, and medications to correct coagulation failure.
6. Monitor fetal status.
7. Prepare for emergency delivery when the client is stabilized.
8. Provide emotional support to the client, partner, and family.

XI. Fetal Distress

A. Assessment

1. Fetal heart rate less than 110 beats/minute or greater than 160 beats/minute
2. Meconium-stained amniotic fluid
3. Fetal hypoactivity or hyperactivity
4. Progressive decrease in baseline variability
5. Severe variable decelerations
6. Late decelerations

B. Interventions

1. Discontinue oxytocin if infusing.
2. Place the client in a lateral position.
3. Administer oxygen, 8 to 10 L/minute, via face mask.
4. Monitor maternal and fetal status.

 In the event of fetal distress, prepare the client for emergency cesarean delivery.

XII. Intrauterine Fetal Demise

A. Assessment

1. Loss of fetal movement
2. Absence of fetal heart tones
3. Disseminated intravascular coagulation (DIC) screen (monitor for coagulation abnormalities because DIC is a complication related to intrauterine fetal demise)
4. Low hemoglobin and hematocrit; low platelet count; prolonged bleeding and clotting time
5. Bleeding from puncture sites (could indicate DIC)

B. Interventions

1. Encourage the client and her family to verbalize feelings; provide emotional support.
2. Incorporate religious and cultural health care beliefs and practices in the plan of care.
3. Allow the client choices relating to labor and delivery.
4. Administer IV fluids, medications, and blood and blood products as prescribed if DIC occurs.

XIII. Rupture of the Uterus

A. Description

1. Complete or incomplete separation of the uterine tissue as a result of a tear in the wall of the uterus from the stress of **labor**
2. Complete: Direct communication between the uterine and peritoneal cavities
3. Incomplete: Rupture into the peritoneum covering the uterus, but not into the peritoneal cavity
4. Manifestations vary with the degree of rupture.
5. Risk factors: Labor after previous cesarean section, overdistended uterus (e.g., multiple fetuses or hydramnios) after cesarean section, abdominal trauma

B. Assessment

1. Abdominal pain or tenderness
2. Chest pain
3. Contractions may stop or fail to progress
4. Rigid abdomen
5. Absent fetal heart rate
6. Signs of maternal shock
7. Fetus palpated outside the uterus (complete rupture)

- C. Interventions
1. Monitor for and treat signs of shock (administer oxygen, IV fluids, and blood products).
 2. Prepare client for cesarean delivery (possible hysterectomy may be necessary).
 3. Provide emotional support for the client and partner.

XIV. Uterine Inversion

A. Description

1. **Uterus** completely or partly turns inside out.
2. This can occur during delivery or after delivery of the **placenta**.
3. Risk factors: Fundal implantation of the placenta, manual extraction of the placenta, short umbilical cord, uterine atony, leiomyomas, and abnormally adherent placental tissue

B. Assessment

1. A depression in the fundal area of the uterus is noted.
2. The interior of the uterus may be seen through the cervix or protruding through the **vagina**.
3. The client has severe pain.
4. Hemorrhage is evident.
5. The client shows signs of shock.

C. Interventions

1. Monitor for hemorrhage and signs of shock, and treat shock.
2. Prepare the client for a return of the uterus to the correct position via the vagina; if unsuccessful, laparotomy with replacement to the correct position is done.

284. The maternity nurse is preparing for the admission of a client in the third trimester of pregnancy who is experiencing vaginal bleeding and has a suspected diagnosis of placenta previa. The nurse reviews the health care provider's prescriptions and should question which prescription?

1. Prepare the client for an ultrasound.
2. Obtain equipment for a manual pelvic examination.
3. Prepare to draw a hemoglobin and hematocrit blood sample.
4. Obtain equipment for external electronic fetal heart rate monitoring.

285. An ultrasound is performed on a client at term gestation who is experiencing moderate vaginal bleeding. The results of the ultrasound indicate that abruptio placentae is present. On the basis of these findings, the nurse should prepare the client for which anticipated prescription?

1. Delivery of the fetus
2. **Strict monitoring of intake and output**
3. Complete bed rest for the remainder of the pregnancy
4. The need for weekly monitoring of coagulation studies until the time of delivery

286. The nurse is performing an assessment on a client who has just been told that a pregnancy test is positive. Which assessment finding indicates that the client is at risk for preterm labor?

1. The client is a 35-year-old primigravida.
2. The client has a history of cardiac disease.
3. The client's hemoglobin level is 13.5 g/dL (135 mmol/L).
4. The client is a 20-year-old primigravida of average weight and height.

- ❖ 287. The nurse is monitoring a client who is in the active stage of labor. The nurse documents that the client is experiencing labor dystocia. The nurse determines that which risk factors in the client's history placed her at risk for this complication? Select all that apply.

- 1. Age 54
- 2. Body mass index of 28
- 3. Previous difficulty with fertility
- 4. Administration of oxytocin for induction
- 5. Potassium level of 3.6 mEq/L (3.6 mmol/L)

288. The nurse in a birthing room is monitoring a client with dysfunctional labor for signs of fetal or maternal compromise. Which assessment finding should alert the nurse to a compromise?

1. Maternal fatigue
2. Coordinated uterine contractions

CRITICAL THINKING What Should You Do?

Answer If a pregnant client experiences a hypotensive episode, the nurse should position the client on her side to shift the weight of the fetus off the vena cava until the client's signs and symptoms subside, and should monitor vital signs until stable. The nurse should also monitor the fetal heart rate. To reposition the client, a pillow or wedge should be placed under the client's hip to displace the gravid uterus off the vena cava, and the supine position should be avoided.

Reference: Lowdermilk et al. (2016), pp. 313, 400.

PRACTICE QUESTIONS

283. The nurse is assessing a pregnant client in the second trimester of pregnancy who was admitted to the maternity unit with a suspected diagnosis of abruptio placentae. Which assessment finding should the nurse expect to note if this condition is present?

1. Soft abdomen
2. Uterine tenderness
3. Absence of abdominal pain
4. Painless, bright red vaginal bleeding

3. Progressive changes in the cervix
 4. Persistent nonreassuring fetal heart rate
289. The nurse in a labor room is preparing to care for a client with hypertonic uterine contractions. The nurse is told that the client is experiencing uncoordinated contractions that are erratic in their frequency, duration, and intensity. What is the priority nursing action?
1. Provide pain relief measures.
 2. Prepare the client for an amniotomy.
 3. Promote ambulation every 30 minutes.
 4. Monitor the oxytocin infusion closely.
290. The nurse is reviewing the health care provider's (HCP's) prescriptions for a client admitted for premature rupture of the membranes. Gestational age of the fetus is determined to be 37 weeks. Which prescription should the nurse question?
1. Monitor fetal heart rate continuously.
 2. Monitor maternal vital signs frequently.
 3. Perform a vaginal examination every shift.
 4. Administer an antibiotic per HCP prescription and per agency protocol.
291. The nurse has created a plan of care for a client experiencing dystocia and includes several nursing actions in the plan of care. What is the priority nursing action?
1. Providing comfort measures
 2. Monitoring the fetal heart rate
 3. Changing the client's position frequently
 4. Keeping the significant other informed of the progress of the labor
292. Fetal distress is occurring with a laboring client. As the nurse prepares the client for a cesarean birth, what is the most important nursing action?
1. Slow the intravenous flow rate.
 2. Continue the oxytocin drip if infusing.
 3. Place the client in a high Fowler's position.
 4. Administer oxygen, 8 to 10 L/minute, via face mask.
293. The nurse in the postpartum unit is caring for a client who has just delivered a newborn infant following a pregnancy with placenta previa. The nurse reviews the plan of care and prepares to monitor the client for which risk associated with placenta previa?
1. Infection
 2. Hemorrhage
 3. Chronic hypertension
 4. Disseminated intravascular coagulation
- ❖ 294. The nurse is performing an assessment on a client diagnosed with placenta previa. Which assessment findings should the nurse expect to note? Select all that apply.
- 1. Uterine rigidity
 - 2. Uterine tenderness
 - 3. Severe abdominal pain
 - 4. Bright red vaginal bleeding
 - 5. Soft, relaxed, nontender uterus
 - 6. Fundal height may be greater than expected for gestational age
295. The nurse in a labor room is performing a vaginal assessment on a pregnant client in labor. The nurse notes the presence of the umbilical cord protruding from the vagina. What is the first nursing action with this finding?
1. Gently push the cord into the vagina.
 2. Place the client in Trendelenburg position.
 3. Find the closest telephone and page the health care provider stat.
 4. Call the delivery room to notify the staff that the client will be transported immediately.

ANSWERS

283. 2

Rationale: Abruption placentae is the premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered. In abruption placentae, acute abdominal pain is present. Uterine tenderness accompanies placental abruption, especially with a central abruption and trapped blood behind the placenta. The abdomen feels hard and boardlike on palpation as the blood penetrates the myometrium and causes uterine irritability. A soft abdomen and painless, bright red vaginal bleeding in the second or third trimester of pregnancy are signs of placenta previa. Test-Taking Strategy: Focus on the **subject**, abruption placentae. Remember that the difference between placenta previa

and abruption placentae involves the presence of uterine pain and tenderness with abruption placentae, as opposed to painless bleeding with placenta previa.

Review: Signs of **abruption placentae**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), p. 683.

284. 2

Rationale: Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Manual pelvic examinations are contraindicated when

vaginal bleeding is apparent until a diagnosis is made and placenta previa is ruled out. Digital examination of the cervix can lead to hemorrhage. A diagnosis of placenta previa is made by ultrasound. The hemoglobin and hematocrit levels are monitored, and external electronic fetal heart rate monitoring is initiated. Electronic fetal monitoring (external) is crucial in evaluating the status of the fetus, who is at risk for severe hypoxia.

Test-Taking Strategy: Focus on the **subject**, nursing care of the client with placenta previa. Use knowledge of the pathophysiology associated with placenta previa. Note the words question which prescription in the event query. Also, note that the correct option is the only procedure that is invasive to the pregnancy and endangers the physiological safety of the client and the fetus.

Review: Care of the client with **placenta previa**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Intrapartum

Priority Concepts: Collaboration; Safety

Reference: Lowdermilk et al. (2016), pp. 680-682.

285. 1

Rationale: Abruptio placentae is the premature separation of the placenta from the uterine wall after the twentieth week of gestation and before the fetus is delivered. The goal of management in abruptio placentae is to control the hemorrhage and deliver the fetus as soon as possible. Delivery is the treatment of choice if the fetus is at term gestation or if the bleeding is moderate to severe and the client or fetus is in jeopardy. Because delivery of the fetus is necessary, options 2, 3, and 4 are incorrect regarding management of a client with abruptio placentae.

Test-Taking Strategy: Focus on the **subject**, management of abruptio placentae. Use knowledge regarding the management of abruptio placentae to answer the question. Note the words term gestation and moderate vaginal bleeding. Knowing that the goal is to deliver the fetus will direct you easily to the correct option.

Review: Nursing management of **abruptio placentae**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Perfusion; Safety

Reference: Lowdermilk et al. (2016), pp. 682-684.

286. 2

Rationale: Preterm labor occurs after the twentieth week but before the thirty-seventh week of gestation. Several factors are associated with preterm labor, including a history of medical conditions, present and past obstetric problems, social and environmental factors, and substance abuse. Other risk factors include a multifetal pregnancy, which contributes to overdistention of the uterus; anemia, which decreases oxygen supply to the uterus; and age younger than 18 years or first pregnancy at age older than 40 years.

Test-Taking Strategy: Options 1, 3, and 4 are **comparable or alike** and are average and normal findings. Also note that the

correct option is the only option that identifies an abnormal condition.

Review: Risk factors for **preterm labor**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Antepartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), pp. 760-761.

❖ 287. 1, 2, 3

Rationale: Risk factors that increase a woman's risk for dysfunctional labor include the following: advanced maternal age, being overweight, electrolyte imbalances, previous difficulty with fertility, uterine overstimulation with oxytocin, short stature, prior version, masculine characteristics, uterine abnormalities, malpresentations and position of the fetus, cephalopelvic disproportion, maternal fatigue, dehydration, fear, administration of an analgesic early in labor, and use of epidural analgesia. Age 54 is considered advanced maternal age, and a body mass index of 28 is considered overweight. Previous difficulty with infertility is another risk factor for labor dystocia. A potassium level of 3.6 mEq/L (3.6 mmol/L) is normal and administration of oxytocin alone is not a risk factor; risk exists only if uterine hyperstimulation occurs.

Test-Taking Strategy: Focus on the **subject**, risk factors for labor dystocia. Additionally, **focus on the data in the question**, look at each option, and determine if these are normal assessment findings.

Review: **Dystocia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Communication and Documentation

Content Area: Maternity—Intrapartum

Priority Concepts: Communication; Perfusion

Reference:

Lowdermilk et al. (2016), p. 773.

288. 4

Rationale: Signs of fetal or maternal compromise include a persistent, nonreassuring fetal heart rate, fetal acidosis, and the passage of meconium. Maternal fatigue and infection can occur if the labor is prolonged, but do not indicate fetal or maternal compromise. Coordinated uterine contractions and progressive changes in the cervix are a reassuring pattern in labor.

Test-Taking Strategy: Focus on the **subject**, signs of fetal or maternal compromise. Eliminate options 1, 2, and 3 because they are **comparable or alike** and are normal expectations during labor.

Review: Assessment findings that indicate **fetal or maternal compromise**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), pp. 773-774.

289. 1

Rationale: Hypertonic uterine contractions are painful, occur frequently, and are uncoordinated. Management of hypertonic labor depends on the cause. Relief of pain is the primary intervention to promote a normal labor pattern. An amniotomy and oxytocin infusion are not treatment measures for hypertonic contractions; however, these treatments may be used in clients with hypotonic dysfunction. A client with hypertonic uterine contractions would not be encouraged to ambulate every 30 minutes, but would be encouraged to rest.

Test-Taking Strategy: Focus on the **strategic word**, priority. Also note that options 2, 3, and 4 are **comparable or alike** and are therapeutic measures for hypotonic dysfunction.

Review: Management of **hypertonic uterine contractions**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Pain

Reference: Lowdermilk et al. (2016), pp. 774, 799.

290. 3

Rationale: Vaginal examinations should not be done routinely on a client with premature rupture of the membranes because of the risk of infection. The nurse would expect to monitor fetal heart rate, monitor maternal vital signs, and administer an antibiotic.

Test-Taking Strategy: Note the word question. This word indicates the activity that the nurse should not implement without clarification. Options 1, 2, and 4 are **comparable or alike** and are expected activities for the nurse to perform for a client with premature rupture of the membranes. Performing a vaginal examination every shift should not be done on a client with premature rupture of the membranes because of the risk of infection, so the nurse would question this prescription.

Review: Care of the client with **premature rupture of the membranes**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Intrapartum

Priority Concepts: Collaboration; Safety

References: Lowdermilk et al. (2016), pp. 770-771.

291. 2

Rationale: Dystocia is difficult labor that is prolonged or more painful than expected. The priority is to monitor the fetal heart rate. Although providing comfort measures, changing the client's position frequently, and keeping the significant other informed of the progress of the labor are components of the plan of care, the fetal status would be the priority.

Test-Taking Strategy: Note the **strategic word**, priority. Use **Maslow's Hierarchy of Needs theory** and the **ABCs—airway—breathing—circulation**—to assist in answering the question.

Review: Priority nursing interventions for the client with **dystocia**

Level of Cognitive Ability: Creating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), pp. 775, 777-778.

292. 4

Rationale: Oxygen is administered, 8 to 10 L/minute, via face mask to optimize oxygenation of the circulating blood. Option 1 is incorrect because the intravenous infusion should be increased (per health care provider prescription) to increase the maternal blood volume. Option 2 is incorrect because oxytocin stimulation of the uterus is discontinued if fetal heart rate patterns change for any reason. Option 3 is incorrect because the client is placed in the lateral position with her legs raised to increase maternal blood volume and improve fetal perfusion.

Test-Taking Strategy: Note the **strategic words**, most important. Use the **ABCs—airway—breathing—circulation**. Oxygen is the only option that would improve cardiac output and improve perfusion to the fetus. The other options would not improve perfusion to the fetus.

Review: Care of the laboring client experiencing **fetal distress**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), p. 399.

293. 2

Rationale: In placenta previa, the placenta is implanted in the lower uterine segment. The lower uterine segment does not contain the same intertwining musculature as the fundus of the uterus, and this site is more prone to bleeding. Options 1, 3, and 4 are not risks that are related specifically to placenta previa.

Test-Taking Strategy: Focus on the **subject**, the risks associated with placenta previa. Thinking about the pathophysiology associated with this disorder and recalling that bleeding is a primary concern in this client will direct you easily to the correct option.

Review: **Placenta previa**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Postpartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), p. 682.

❖ 294. 4, 5, 6

Rationale: Placenta previa is an improperly implanted placenta in the lower uterine segment near or over the internal cervical os. Painless, bright red vaginal bleeding in the second or third trimester of pregnancy is a sign of placenta previa. The client has a soft, relaxed, nontender uterus, and fundal height may be more than expected for gestational age. In abruptio placentae, severe abdominal pain is present. Uterine tenderness accompanies placental abruption. In addition, in abruptio placentae, the abdomen feels hard and boardlike on palpation as the blood penetrates the myometrium and causes uterine irritability.

Test-Taking Strategy: First, eliminate options 1 and 2 because they are **comparable or alike**. Next, remember that the difference between placenta previa and abruptio placentae involves the presence of uterine pain and tenderness with abruptio placentae, as opposed to painless bright red bleeding with placenta previa.

Review: Signs of **placenta previa** and **abruptio placentae**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Intrapartum

Priority Concepts: Clinical Judgment; Perfusion

Reference: Lowdermilk et al. (2016), pp. 680-681.

295. 2

Rationale: When cord prolapse occurs, prompt actions are taken to relieve cord compression and increase fetal oxygenation. The client should be positioned with the hips higher than the head to shift the fetal presenting part toward the diaphragm. The nurse should push the call light to summon help, and other staff members should call the health care provider

and notify the delivery room. If the cord is protruding from the vagina, no attempt should be made to replace it because to do so could traumatize it and reduce blood flow further. Also as a first action, the examiner should place a gloved hand into the vagina and hold the presenting part off the umbilical cord. Oxygen, 8 to 10 L/minute, by face mask is administered to the client to increase fetal oxygenation.

Test-Taking Strategy: Note the **strategic word**, first, and that the umbilical cord is protruding from the vagina. Options 3 and 4 can be eliminated first because these actions delay necessary and immediate treatment. Recalling that the goal is to relieve cord compression and to increase fetal oxygenation will direct you to the correct option. Also remember that the cord should not be pushed back into the vagina.

Review: Priority nursing measures for **prolapsed cord**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Postpartum Period

PRIORITY CONCEPTS Health Promotion, Reproduction

CRITICAL THINKING What Should You Do?

The nurse is caring for a postpartum client on her third day following birth. When entering the new mother's room, she finds the client in tears. The new mother states, "I do not know why I am acting like such a baby. I feel prepared for my new role." How should the nurse respond to the new mother?
Answer located on p. 360.

I. Postpartum

- A. Description: Period when the reproductive tract returns to the normal, nonpregnant state
- B. The postpartum period starts immediately after birth and is usually completed by week 6 following birth.

II. Physiological Maternal Changes

A. Involution

1. Description
 - a. Involution is the rapid decrease in the size of the uterus as it returns to the nonpregnant state.
 - b. Clients who breast-feed may experience a more rapid involution because of the release of oxytocin during breast-feeding.
2. Assessment
 - a. The weight of the uterus decreases from approximately 2 lb (900 g) to 2 oz (57 g) in 6 weeks.
 - b. The endometrium regenerates.
 - c. The fundus steadily descends into the pelvis.
 - d. Fundal height decreases about 1 cm/day (Fig. 29-1).
 - e. By 10 days postpartum, the uterus cannot be palpated abdominally.
 - f. A flaccid fundus indicates uterine atony, and it should be massaged until firm; a tender fundus indicates an infection.
 - g. Afterpains decrease in frequency after the first few days.

B. Lochia

1. Description: Discharge from the uterus that consists of blood from the vessels of the placental site and debris from the decidua
2. Assessment (Box 29-1)
 - a. Rubra is bright red discharge that occurs from day of birth to day 3.
 - b. Serosa is brownish pink discharge that occurs from days 4 to 10.
 - c. Alba is white discharge that occurs from days 11 to 14.
 - d. The discharge should smell like normal menstrual flow.
 - e. Discharge decreases daily in amount.
 - f. Discharge may increase with ambulation.

! To determine most accurately the amount of lochial flow, weigh the perineal pad before and after use and identify the amount of time between pad changes.

- C. Cervix: Cervical involution occurs, and the muscle begins to regenerate after 1 week.
- D. Vagina: Vaginal distention decreases, although muscle tone is never restored completely to the pregravid state.
- E. Ovarian function and menstruation
 1. Ovarian function depends on the rapidity with which pituitary function is restored.
 2. Menstrual flow resumes within 1 to 2 months in non-breast-feeding mothers.
 3. Menstrual flow usually resumes within 3 to 6 months in breast-feeding mothers.
 4. Breast-feeding mothers may experience amenorrhea during the entire period of lactation.

! Women may ovulate without menstruating, so breast-feeding should not be considered a form of birth control.

F. Breasts

1. Breasts continue to secrete colostrum for the first 48 to 72 hours after birth.
2. A decrease in estrogen and progesterone levels after birth stimulates increased prolactin levels, which promote breast milk production.

FIGURE 29-1 Involution of the uterus. The height of the uterine fundus decreases by approximately 1 cm/day.

BOX 29-1 Amount of Lochia

- Scant: Less than 2.5 cm (< 1 inch) on menstrual pad in 1 hour
- Light: Less than 10 cm (< 4 inches) on menstrual pad in 1 hour
- Moderate: Less than 15 cm (< 6 inches) on menstrual pad in 1 hour
- Heavy: Saturated menstrual pad in 1 hour
- Excessive: Menstrual pad saturated in 15 minutes

From Murray S, McKinney E: Foundations of maternal-newborn and women's health nursing, ed 5, Philadelphia, 2010, Saunders.

3. Breasts become distended with milk on the third day.
4. Engorgement occurs on approximately day 4 in both breast-feeding and non-breast-feeding mothers. [Box 29-2](#) summarizes care of breasts for non-breast-feeding mothers.
5. Breast-feeding relieves engorgement.

G. Urinary tract

1. The client may have urinary retention as a result of loss of elasticity and tone and loss of sensation in the bladder from trauma, medications, anesthesia, and lack of privacy.
2. Diuresis usually begins within the first 12 hours after birth.

BOX 29-2 Breast Care for Non-Breast-Feeding Mothers

- Avoid nipple stimulation.
- Apply a breast binder, wear a snug-fitting bra, apply ice packs, or take a mild analgesic for engorgement.
- Engorgement usually resolves within 24 to 36 hours after it begins.

- H. Gastrointestinal tract
 1. Clients are usually hungry after birth.
 2. Constipation can occur, with bowel movement (soft, formed stool) by the second or third postpartum day.
 3. Hemorrhoids are common.
- I. Vital signs ([Table 29-1](#))

III. Postpartum Interventions

A. Assessment

1. Monitor vital signs.
2. Assess pain level.
3. Assess height, consistency, and location of the fundus (have client empty the bladder before fundal assessment) ([Fig. 29-2](#)).

TABLE 29-1 Normal Postpartum Vital Signs

Vital Sign	Description
Temperature	May increase to 100.4°F (38.0°C) during the first 24 hr postpartum because of dehydrating effects of labor. Any higher elevation may be caused by infection and must be reported.
Pulse	May decrease to 50 beats/min (normal puerperal bradycardia). Pulse > 100 beats/min may indicate excessive blood loss or infection.
Blood pressure	Should be normal; suspect hypovolemia if it decreases.
Respirations	Rarely change; if respirations increase significantly, suspect pulmonary embolism, uterine atony, or hemorrhage.

FIGURE 29-2 A full bladder displaces and prevents contraction of the uterus.

4. Monitor color, amount, and odor of lochia.
5. Assess breasts for engorgement.
6. Monitor perineum for swelling or discoloration.
7. Monitor for perineal lacerations or episiotomy for healing.
8. Assess incisions or dressings of client who had a cesarean birth.
9. Monitor bowel status.
10. Monitor intake and output.
11. Encourage frequent voiding.
12. Encourage ambulation.
13. Assess extremities for thrombophlebitis (redness, tenderness, or warmth of the leg).
14. Administer Rh_o(D) immune globulin if prescribed within 72 hours postpartum to Rh-negative client who has given birth to Rh-positive newborn.
15. Evaluate rubella immunity. If not immune, administer rubella immunization.
16. Assess bonding with the newborn.
17. Assess emotional status.

B. Client teaching

1. Demonstrate newborn care skills as necessary.
2. Provide the opportunity for the client to bathe the newborn.
3. Instruct in feeding technique.
4. Instruct the client to avoid heavy lifting for at least 3 weeks.
5. Instruct the client to plan at least 1 rest period per day.
6. Instruct the client that contraception should begin after birth or with the initiation of intercourse (intercourse should be postponed at least until lochia ceases). With rubella immunization, avoid conception for 1 to 3 months based on health care provider (HCP) recommendation.
7. Instruct the client in the importance of follow-up, which should be scheduled at 4 to 6 weeks.
8. Instruct the client to report any signs of chills, fever, increased lochia, or depressed feelings to the HCP immediately.

IV. Postpartum Discomforts

A. Afterbirth pains

1. Occur as a result of contractions of the uterus
2. Are more common in multiparas, breast-feeding mothers, clients treated with oxytocin, and clients who had an overdistended uterus during pregnancy, such as with carrying twins

B. Perineal discomfort

1. Apply ice packs to the perineum during the first 24 hours to reduce swelling.
2. After the first 24 hours, apply warmth by sitz baths.

C. Episiotomy

1. If done, instruct the client to administer perineal care after each voiding.

2. Encourage the use of an analgesic spray as prescribed.
3. Administer analgesics as prescribed if comfort measures are unsuccessful.

D. Perineal lacerations

1. Care as for an episiotomy; administer perineal care and use analgesic spray and analgesics for comfort.
2. Rectal suppositories and enemas may be contraindicated (to avoid injury to sutures).

E. Breast discomfort from engorgement

1. Encourage the client to wear a support bra at all times, even while she is sleeping.
2. Encourage the use of ice packs between feedings if the client is breast-feeding.
3. Encourage the use of warm soaks or a warm shower before feeding for the breast-feeding mother.
4. Administer analgesics as prescribed if comfort measures are unsuccessful.

F. Constipation

1. Encourage adequate intake of fluids (2000 mL/day).
2. Encourage diet high in fiber.
3. Encourage ambulation.
4. Administer stool softener, laxative, enema, or suppository if needed and prescribed.

G. Postpartum emotional changes (Box 29-3)

1. Acknowledge the client's feelings and demonstrate a caring attitude.
2. Determine availability of family support and other support systems and resources as needed.
3. Encourage and assist the client to verbalize her feelings.
4. Monitor the newborn for appropriate growth and development expectations.
5. Assist the significant other and other appropriate family members to discuss feelings and identify ways to assist the client.

 All clients should be assessed for depression during pregnancy and in the postpartum period.

V. Nutritional Counseling

- A. Discuss caloric intake with breast-feeding and non-breast-feeding mothers.
- B. Nutritional needs depend on prepregnancy weight, ideal weight for height, and whether the client is breast-feeding.
- C. If the client is breast-feeding, calorie needs increase by 200 to 500 calories/day, and the client may require increased fluids and the continuance of prenatal vitamins and minerals.

VI. Breast-Feeding

A. Interventions

1. Put the newborn to the mother's breast as soon as the mother's and newborn's conditions are stable (on delivery table, if possible).

BOX 29-3 Signs and Symptoms of Emotional Changes**Postpartum Blues**

- Anger
- Anxiety
- Cries easily for no apparent reason
- Emotionally labile
- Expresses a let-down feeling
- Fatigue
- Headache
- Insomnia
- Restlessness
- Sadness

Postpartum Depression

- Anxiety
- Appetite changes
- Crying, sadness

- Difficulty concentrating or making decisions
- Fatigue, unable to sleep
- Feelings of guilt
- Irritability and agitation
- Lack of energy
- Less responsive to the infant
- Loss of pleasure in normal activities
- Suicidal thoughts

Postpartum Psychosis

- Break with reality
- Confusion
- Delirium
- Delusions
- Hallucinations
- Panic

Data from Lowdermilk D, Cashion MC, Perry S: Maternity & women's health care, ed 9, St. Louis, 2011, Mosby; Lowdermilk D, Perry S, Cashion MC, Alden K: Maternity & women's health care, ed 10, St. Louis, 2012, Mosby; and Perry S, Hockenberry M, Lowdermilk D, Wilson D: Maternal-child nursing care, ed 4, St. Louis, 2013, Mosby.

2. Stay with the client each time she nurses until she feels secure and confident with the newborn and her feelings.
3. Assess LATCH (latch achieved by newborn; audible swallowing; type of nipple; comfort of mother; hold or position of baby).
4. Uterine cramping may occur the first day after birth while the client is nursing, when oxytocin stimulation causes the uterus to contract.
5. Instruct the client to use general hygiene and wash the breasts once daily.
6. If engorgement occurs, breast-feed frequently, apply warm packs before feeding, apply ice packs between feedings, and massage the breasts.
7. The client should not use soap on the breasts because it tends to remove natural oils, which increases the chance of cracked nipples.
8. If cracked nipples develop, the client should expose the nipples to air for 10 to 20 minutes after feeding, rotate the position of the baby for each feeding, and ensure that the baby is latched on to the areola, not just the nipple.
9. The bra should be well fitted and supporting; avoid an underwire bra.
10. Breasts may leak between feedings or during coitus; place breast pad in bra.
11. Calories should be increased by 200 to 500 calories/day, and the diet should include additional fluids; prenatal vitamins should be taken as prescribed.
12. Newborn's stools are usually light yellow, seedy, watery, and frequent.

13. Medications, including over-the-counter medications, need to be avoided unless prescribed because they may be unsafe when breast-feeding.
 14. Gas-producing foods and caffeine should be avoided.
 15. Oral contraceptives containing estrogen are not recommended for breast-feeding mothers; progestin-only birth control pills are less likely to interfere with the milk supply.
 16. The infant will develop his or her own feeding schedule.
- B. Breast-feeding procedure for the mother (**Box 29-4**)

BOX 29-4 Breast-Feeding Procedure for the Mother

1. Wash hands and assume a comfortable position.
2. Start with the breast with which the last feeding ended.
3. Brush the newborn's lower lip with nipple.
4. Tickle the lips to have the newborn open the mouth wide.
5. Guide the nipple and surrounding areola into the newborn's mouth.
6. Encourage the newborn to nurse on each breast for 15 to 20 minutes.
7. After the newborn has nursed, release suction by depressing the newborn's chin or inserting a clean finger into the newborn's mouth.
8. Burp the newborn after the first breast.
9. Repeat the procedure on the second breast until the newborn stops nursing.
10. Burp the newborn again.
11. Listen for audible sucking and swallowing.

CRITICAL THINKING What Should You Do?

Answer: The nurse should recognize that the new mother is experiencing a normal phenomenon, postpartum blues, and explain to the new mother what she is experiencing along with ways to minimize the “blues” (e.g., adequate nutrition, rest, diversional activity). In addition, this is an ideal opportunity for the nurse to address signs and symptoms of postpartum depression so if a more serious situation develops, the new mother understands when to seek help.

Reference: Lowdermilk et al. (2016), pp. 509, 749.

PRACTICE QUESTIONS

296. The postpartum nurse is taking the vital signs of a client who delivered a healthy newborn 4 hours ago. The nurse notes that the client’s temperature is 100.2°F. What is the priority nursing action?
1. Document the findings.
 2. Retake the temperature in 15 minutes.
 3. Notify the health care provider (HCP).
 4. Increase hydration by encouraging oral fluids.
297. The nurse is assessing a client who is 6 hours postpartum after delivering a full-term healthy newborn. The client complains to the nurse of feelings of faintness and dizziness. Which nursing action is most appropriate?
1. Raise the head of the client’s bed.
 2. Obtain hemoglobin and hematocrit levels.
 3. Instruct the client to request help when getting out of bed.
 4. Inform the nursery room nurse to avoid bringing the newborn to the client until the client’s symptoms have subsided.
298. The postpartum nurse is providing instructions to a client after birth of a healthy newborn. Which time frame should the nurse relay to the client regarding the return of bowel function?
1. 3 days postpartum
 2. 7 days postpartum
 3. On the day of birth
 4. Within 2 weeks postpartum
299. The nurse is planning care for a postpartum client who had a vaginal delivery 2 hours ago. The client required an episiotomy and has several hemorrhoids. What is the priority nursing consideration for this client?
1. Client pain level
 2. Inadequate urinary output
 3. Client perception of body changes
 4. Potential for imbalanced body fluid volume
300. The nurse is providing postpartum instructions to a client who will be breast-feeding her newborn. The nurse determines that the client has understood the instructions if she makes which statements? Select all that apply.
- 1. “I should wear a bra that provides support.”
 - 2. “Drinking alcohol can affect my milk supply.”
 - 3. “The use of caffeine can decrease my milk supply.”
 - 4. “I will start my estrogen birth control pills again as soon as I get home.”
 - 5. “I know if my breasts get engorged, I will limit my breast-feeding and supplement the baby.”
 - 6. “I plan on having bottled water available in the refrigerator so I can get additional fluids easily.”
301. The nurse is teaching a postpartum client about breast-feeding. Which instruction should the nurse include?
1. The diet should include additional fluids.
 2. Prenatal vitamins should be discontinued.
 3. Soap should be used to cleanse the breasts.
 4. Birth control measures are unnecessary while breast-feeding.
302. The nurse is preparing to assess the uterine fundus of a client in the immediate postpartum period. After locating the fundus, the nurse notes that the uterus feels soft and boggy. Which nursing intervention is appropriate?
1. Elevate the client’s legs.
 2. Massage the fundus until it is firm.
 3. Ask the client to turn on her left side.
 4. Push on the uterus to assist in expressing clots.
303. The nurse is caring for four 1-day postpartum clients. Which client assessment requires the need for follow-up?
1. The client with mild afterpains
 2. The client with a pulse rate of 60 beats/minute
 3. The client with colostrum discharge from both breasts
 4. The client with lochia that is red and has a foul-smelling odor
304. When performing a postpartum assessment on a client, the nurse notes the presence of clots in the lochia. The nurse examines the clots and notes that they are larger than 1 cm. Which nursing action is most appropriate?

1. Document the findings.
 2. Reassess the client in 2 hours.
 3. Notify the health care provider (HCP).
 4. Encourage increased oral intake of fluids.
305. The nurse is monitoring the amount of lochia drainage in a client who is 2 hours postpartum and notes that the client has saturated a perineal pad in 15 minutes. How should the nurse respond to this finding initially?
1. Document the finding.
 2. Encourage the client to ambulate.
 3. Encourage the client to increase fluid intake.
 4. Contact the health care provider (HCP) and inform the HCP of this finding.
306. The nurse has provided discharge instructions to a client who delivered a healthy newborn by cesarean delivery. Which statement made by the client indicates a need for further instruction?
1. “I will begin abdominal exercises immediately.”
 2. “I will notify the health care provider if I develop a fever.”
 3. “I will turn on my side and push up with my arms to get out of bed.”
 4. “I will lift nothing heavier than my newborn baby for at least 2 weeks.”
307. After a precipitous delivery, the nurse notes that the new mother is passive and touches her newborn infant only briefly with her fingertips. What should the nurse do to help the woman process the delivery?
1. Encourage the mother to breast-feed soon after birth.
 2. Support the mother in her reaction to the newborn infant.
 3. Tell the mother that it is important to hold the newborn infant.
 4. Document a complete account of the mother’s reaction on the birth record.

ANSWERS

296. 4

Rationale: The client’s temperature should be taken every 4 hours while she is awake. Temperatures up to 100.4°F (38°C) in the first 24 hours after birth often are related to the dehydrating effects of labor. The appropriate action is to increase hydration by encouraging oral fluids, which should bring the temperature to a normal reading. Although the nurse also would document the findings, the appropriate action would be to increase hydration. Taking the temperature in another 15 minutes is an unnecessary action. Contacting the HCP is not necessary.

Test-Taking Strategy: Note the **strategic word**, priority, and use knowledge regarding the physiological findings in the immediate postpartum period to answer this question. Recalling that a temperature elevation often is related to the dehydrating effects of labor will direct you to the correct option. Also, increasing hydration relates to a physiological client need.

Review: **Normal postpartum assessment findings**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Postpartum

Priority Concepts: Reproduction; Thermoregulation

Reference: Lowdermilk et al. (2016), pp. 484-485.

297. 3

Rationale: Orthostatic hypotension may be evident during the first 8 hours after birth. Feelings of faintness or dizziness are signs that caution the nurse to focus interventions on the client’s safety. The nurse should advise the client to get help the first few times she gets out of bed. Option 1 is not a helpful action in this situation and would not relieve the

symptoms. Option 2 requires a health care provider’s prescription. Option 4 is unnecessary.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **subject**, client safety. Option 4 is inappropriate and should be eliminated first. Elevating the client’s head is not a helpful intervention. To select from the remaining options, recall that safety is a primary issue.

Review: **Postpartum nursing interventions**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Postpartum

Priority Concepts: Perfusion; Safety

Reference: Lowdermilk et al. (2016), p. 490.

298. 1

Rationale: After birth, the nurse should auscultate the client’s abdomen in all 4 quadrants to determine the return of bowel sounds. Normal bowel elimination usually returns 2 to 3 days postpartum. Surgery, anesthesia, and the use of opioids and pain control agents also contribute to the longer period of altered bowel functions. Options 2, 3, and 4 are incorrect.

Test-Taking Strategy: Focus on the **subject** and use general principles related to postpartum care. Eliminate options 2 and 4 first because of the length of time stated in these options. From the remaining options, eliminate option 3 because it would seem unreasonable that bowel function would return that quickly in the postpartum woman.

Review: Normal gastrointestinal function in the **postpartum client**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Maternity—Postpartum

Priority Concepts: Client Education; Elimination
Reference: Lowdermilk et al. (2016), p. 491.

299. 1

Rationale: The priority nursing consideration for a client who delivered 2 hours ago and who has an episiotomy and hemorrhoids is client pain level. Most clients have some degree of discomfort during the immediate postpartum period. There are no data in the question that indicate inadequate urinary output, the presence of client perception of body changes, and potential for imbalanced body fluid volume.

Test-Taking Strategy: Note the **strategic word**, priority. Use **Maslow's Hierarchy of Needs theory** to eliminate option 3 because this is a psychosocial, not a physiological, need. To select from the remaining options, **focus on the data in the question**.

Review: Discomforts in the **postpartum client**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Analysis

Content Area: Maternity—Postpartum

Priority Concepts: Pain; Reproduction

Reference: Lowdermilk et al. (2016), pp. 488-489.

❖ 300. 1, 2, 3, 6

Rationale: The postpartum client should wear a bra that is well fitted and supportive. Common causes of decreased milk supply include formula use; inadequate rest or diet; smoking by the mother or others in the home; and use of caffeine, alcohol, or other medications. Breast-feeding clients should increase their daily fluid intake; having bottled water available indicates that the postpartum client understands the importance of increasing fluids. If engorgement occurs, the client should not limit breast-feeding, but should breast-feed frequently. Oral contraceptives containing estrogen are not recommended for breast-feeding mothers.

Test-Taking Strategy: Focus on the **subject** and note the words understood the instructions. Think about the physiology associated with milk production and the complications of breast-feeding to answer correctly.

Review: Postpartum instructions for a **breast-feeding client**

Level of Cognitive Ability: Evaluating

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Evaluation

Content Area: Maternity—Postpartum

Priority Concepts: Health Promotion; Reproduction

Reference: Lowdermilk et al. (2016), pp. 620-621.

301. 1

Rationale: The diet for a breast-feeding client should include additional fluids. Prenatal vitamins should be taken as prescribed, and soap should not be used on the breasts because it tends to remove natural oils, which increases the chance of cracked nipples. Breast-feeding is not a method of contraception, so birth control measures should be resumed.

Test-Taking Strategy: Note the **subject**, teaching for the breast-feeding client. Remember that fluids and calories should be increased when the client is breast-feeding.

Review: **Breast-feeding**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Maternity—Postpartum

Priority Concepts: Client Education; Nutrition

Reference: Lowdermilk et al. (2016), p. 612.

302. 2

Rationale: If the uterus is not contracted firmly, the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated in the uterus. Elevating the client's legs and positioning the client on the side would not assist in managing uterine atony. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage.

Test-Taking Strategy: Focus on the **subject**, a soft and boggy uterus. Visualize the procedure and recall the therapeutic management for uterine atony. Remember that a full bladder displaces the uterus.

Review: **Fundal assessment**

Level of Cognitive Ability: Applying

Client Needs: Health Promotion and Maintenance

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Postpartum

Priority Concepts: Health Promotion; Reproduction

Reference: Lowdermilk et al. (2016), pp. 487-488.

303. 4

Rationale: Lochia, the discharge present after birth, is red for the first 1 to 3 days and gradually decreases in amount. Normal lochia has a fleshy odor or an odor similar to menstrual flow. Foul-smelling or purulent lochia usually indicates infection, and these findings are not normal. The other options are normal findings for a 1-day postpartum client.

Test-Taking Strategy: Note the **strategic words**, need for follow-up. These words indicate a **negative event query** and the need to select the abnormal assessment finding. Note the words foul-smelling in the correct option.

Review: Normal assessment findings in the **postpartum client**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Analysis

Content Area: Maternity—Postpartum

Priority Concepts: Infection; Reproduction

Reference: Lowdermilk et al. (2016), pp. 486, 810.

304. 3

Rationale: Normally, a few small clots may be noted in the lochia in the first 1 to 2 days after birth from pooling of blood in the vagina. Clots larger than 1 cm are considered abnormal. The cause of these clots, such as uterine atony or retained placental fragments, needs to be determined and treated to prevent further blood loss. Although the findings would be documented, the appropriate action is to notify the HCP. Reassessing the client in 2 hours would delay necessary treatment. Increasing oral intake of fluids would not be a helpful action in this situation.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the words larger than 1 cm. Think about the significance of lochial clots in the postpartum period to answer correctly.

Review: Normal findings in the **postpartum client**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Postpartum

Priority Concepts: Clinical Judgment; Clotting

Reference: Lowdermilk et al. (2016), pp. 486-487.

305. 4

Rationale: Lochia is the discharge from the uterus in the postpartum period; it consists of blood from the vessels of the placental site and debris from the decidua. The following can be used as a guide to determine the amount of flow: scant $\frac{1}{4}$ less than 2.5 cm (< 1 inch) on menstrual pad in 1 hour; light $\frac{1}{4}$ less than 10 cm (< 4 inches) on menstrual pad in 1 hour; moderate $\frac{1}{4}$ less than 15 cm (< 6 inches) on menstrual pad in 1 hour; heavy $\frac{1}{4}$ saturated menstrual pad in 1 hour; and excessive $\frac{1}{4}$ menstrual pad saturated in 15 minutes. If the client is experiencing excessive bleeding, the nurse should contact the HCP in the event that postpartum hemorrhage is occurring. It may be appropriate to encourage increased fluid intake, but this is not the initial action. It is not appropriate to encourage ambulation at this time. Documentation should occur once the client has been stabilized.

Test-Taking Strategy: Note the **strategic word**, initially. Focus on the **data in the question**, a saturated perineal pad in 15 minutes. Next, **determine if an abnormality exists**. The data and the use of guidelines to determine the amount of lochial flow will help you to determine that this is abnormal and warrants notification of the HCP.

Review: Assessment of the amount of **lochia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clotting; Reproduction

Reference: Lowdermilk et al. (2016), p. 487.

306. 1

Rationale: A cesarean delivery requires an incision made through the abdominal wall and into the uterus. Abdominal exercises should not start immediately after abdominal surgery; the client should wait at least 3 to 4 weeks postoperatively to allow for healing of the incision. Options 2, 3, and 4 are appropriate instructions for the client after a cesarean delivery.

Test-Taking Strategy: Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Keeping in mind that the client had a cesarean delivery and noting the word immediately in the correct option will assist in directing you to this option.

Review: Home care instructions for a client after **cesarean delivery**

Level of Cognitive Ability: Evaluating

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Maternity—Postpartum

Priority Concepts: Client Education; Reproduction

Reference: Lowdermilk et al. (2016), pp. 793-794.

307. 2

Rationale: Precipitous labor is labor that lasts 3 hours or less. Women who have experienced precipitous labor often describe feelings of disbelief that their labor progressed so rapidly. To assist the client to process what has happened, the best option is to support the client in her reaction to the newborn infant. Options 1, 3, and 4 do not acknowledge the client's feelings.

Test-Taking Strategy: Use **therapeutic communication techniques**. The correct option is the only option that acknowledges the client's feelings.

Review: Use of **therapeutic communication techniques** following delivery

Level of Cognitive Ability: Applying

Client Needs: Psychosocial Integrity

Integrated Process: Caring

Content Area: Maternity—Postpartum

Priority Concepts: Caregiving; Reproduction

Reference: Lowdermilk et al. (2016), pp. 79, 774-775.

CHAPTER 30

Postpartum Complications

PRIORITY CONCEPTS Caregiving, Reproduction

CRITICAL THINKING What Should You Do?

The nurse caring for a client who is 28 hours postpartum notes a temperature of 101.2°F (38.4°C). What should the nurse do? Answer located on p. 368.

I. Cystitis

- A. Description: Cystitis, an infection of the bladder, can occur in the postpartum period, and the postpartum woman should be encouraged to consume adequate fluids and void frequently to avoid bladder distention.
- B. Assessment and interventions (refer to [Chapter 58](#))

! If a urine specimen for culture and sensitivity is prescribed, obtain the specimen before initiating antibiotic therapy.

II. Hematoma

- A. Description
1. A hematoma is a localized collection of blood in the tissues and can occur internally, involving the vaginal sulcus or other organs; vulvar hematomas are the most common ([Fig. 30-1](#)).
 2. Predisposing conditions include operative delivery with forceps and injury to a blood vessel.
 3. A hematoma can be a life-threatening condition.
- B. Assessment
1. Abnormal, severe pain
 2. Pressure in the perineal area
 3. Sensitive, bulging mass in the perineal area with discolored skin
 4. Inability to void
 5. Decreased hemoglobin and hematocrit levels
 6. Changes in vital signs indicating shock such as tachycardia and hypotension
- C. Interventions
1. Monitor client for abnormal pain or perineal pressure, especially when forceps delivery has occurred.

2. Monitor vital signs and for signs of shock.
3. Place ice at the hematoma site.
4. Administer analgesics as prescribed.
5. Prepare for urinary catheterization if the client is unable to void.
6. Administer blood products as prescribed.
7. Monitor for signs of infection, such as increased temperature, pulse rate, and white blood cell count.
8. Administer antibiotics as prescribed because infection is common after hematoma formation.
9. Prepare for incision and evacuation of hematoma if necessary.

III. Uterine Atony

- A. Description: A poorly contracted uterus that does not adequately compress large open vessels at the placental site; this can result in hemorrhage.
- B. Assessment: A soft (boggy) uterus noted on palpation of the uterine fundus
- C. Interventions
1. Massage the uterus until firm ([Fig. 30-2](#)).
 2. Empty the woman's bladder (by voiding or catheterization) if that is contributing to the uterine atony.
 3. Notify the health care provider (HCP) if interventions do not resolve the atony, because this could be an indication of hemorrhage.

IV. Hemorrhage and Shock

- A. Description
1. Bleeding of 500 mL or more after delivery
 2. Can occur early during the first 24 hours after delivery, or later after the first 24 hours following delivery
 3. Causes and predisposing factors ([Box 30-1](#))
- B. Assessment
1. Persistent significant bleeding: Perineal pad is soaked within 15 minutes.
 2. Restlessness, increased pulse rate, decrease in blood pressure, cool and clammy skin, ashen or grayish color
 3. Complaints of weakness, lightheadedness, dyspnea

FIGURE 30-1 A vulvar hematoma is caused by rapid bleeding into soft tissue. It causes severe pain and feelings of pressure.

BOX 30-1 Postpartum Hemorrhage

Causes

- Uterine atony
- Laceration of the cervix or vagina
- Hematoma development in the cervix, perineum, or labia
- Retained placental fragments

Predisposing Factors

- Previous history of postpartum hemorrhage
- Placenta previa
- Abruptio placentae
- Overdistention of the uterus—polyhydramnios, multiple gestation, large neonate
- Infection
- Multiparity
- Dystocia or labor that is prolonged
- Operative delivery—cesarean or forceps delivery, intrauterine manipulation

FIGURE 30-2 Technique for fundal massage.

C. Interventions: See [Priority Nursing Actions](#)

⚡ PRIORITY NURSING ACTIONS

Hemorrhage and Shock in the Postpartum Client

1. Notify primary health care provider (stay with the client and ask another nurse to contact the health care provider).
2. If uterus is atonic, massage gently to cause it to contract.
3. Tilt the woman to her side or elevate the right hip; elevate her legs to at least a 30-degree angle.
4. Administer oxygen by nonrebreather face mask or nasal cannula at 8 to 10 L/min.
5. Monitor vital signs.
6. Administer uterotonic medications (e.g., oxytocin, prostaglandins) as prescribed to increase uterine tone.
7. Provide additional or maintain existing intravenous (IV) infusion of lactated Ringer's solution or normal saline solution to restore circulatory volume (woman should have 2 patent IV lines; insert second IV infusion using 16- to 18-gauge IV catheter).
8. Administer blood or blood products as prescribed.
9. Insert an indwelling urinary catheter to monitor perfusion of kidneys.
10. Administer emergency medications as prescribed.
11. Prepare for possible surgery or other emergency treatments or procedures.
12. Record event, interventions instituted, and woman's response to interventions.

In the postpartum client, if bleeding is excessive and signs of shock are evident, the nurse immediately contacts the health care provider (HCP) because this is a life-threatening situation. The nurse never leaves a client who is unstable or experiencing a life-threatening condition and would ask another nurse to contact the HCP. The nurse should quickly attempt to determine the cause of the hemorrhage, and if the client is experiencing uterine atony, the nurse should massage the uterus gently to cause it to contract (do not push on an uncontracted uterus). The nurse positions the client to assist in perfusion of body organs, implements prescriptions including oxygen administration, and monitors vital signs. Medications to contract the uterus, fluids to restore circulating blood volume, and blood replacement therapy may be prescribed in addition to other emergency medications. Surgical intervention may be required if the bleeding is caused by a laceration or retained placental fragments. The nurse then records the event, the interventions instituted, and the woman's response to interventions.

Reference

Lowdermilk, Perry, Cashion, Alden (2016), pp. 439, 486, 808–809.

V. Infection

- A. Description: Any infection of the reproductive organs that occurs within 28 days of **delivery** or abortion
- B. Assessment
1. Fever
 2. Chills

3. Anorexia
4. Pelvic discomfort or pain
5. Vaginal discharge that is malodorous; normal vaginal discharge has a fleshy odor or an odor similar to a menstrual period.
6. Elevated white blood cell count

! A temperature of 100.4°F (38°C) is normal during the first 24 hours postpartum because of dehydration; a temperature of 100.4°F (38°C) or greater after 24 hours postpartum indicates infection.

C. Interventions

1. Monitor vital signs and temperature every 2 to 4 hours.
2. Make the client as comfortable as possible; position the client to promote vaginal drainage.
3. Keep the client warm, if chilled.
4. Isolate the **newborn** from the client only if the client can infect the newborn.
5. Provide a nutritious, high-calorie, high-protein diet.
6. Encourage fluids to 3000 to 4000 mL/day, if not contraindicated.
7. Encourage frequent voiding and monitor intake and output.
8. Monitor culture results if cultures were prescribed.
9. Administer antibiotics according to identified organism, as prescribed.

VI. Mastitis

A. Description

1. Mastitis is inflammation of the breast as a result of infection.
2. Mastitis occurs primarily in breast-feeding mothers 2 to 3 weeks after **delivery**, but may occur at any time during lactation.

B. Assessment (Fig. 30-3)

1. Localized heat and swelling

FIGURE 30-3 Mastitis.

2. Pain; tender axillary lymph nodes
3. Elevated temperature
4. Complaints of flulike symptoms

C. Interventions

1. Instruct the client in good hand-washing and breast hygiene techniques.
2. Promote comfort.
3. Apply heat or cold to the site as prescribed.
4. Maintain lactation in breast-feeding mothers.
5. Encourage manual expression of breast milk or use of a breast pump every 4 hours.
6. Encourage the client to support the breasts by wearing a supportive bra; avoid wearing an underwire bra.
7. Administer analgesics as prescribed.
8. Administer antibiotics as prescribed.

VII. Pulmonary Embolism

A. Description: Passage of a thrombus, often originating in a uterine or other pelvic vein, into the lungs, where it disrupts the circulation of the blood

B. Assessment

1. Sudden dyspnea and chest pain
2. Tachypnea and tachycardia
3. Cough and lung crackles
4. Hemoptysis
5. Feeling of impending doom

C. Interventions

1. Administer oxygen.
2. Position the client with the head of the bed elevated.
3. Monitor vital signs frequently, especially respiratory and heart rate and breath sounds.
4. Monitor for signs of respiratory distress and for signs of increasing hypoxemia.
5. Administer intravenous fluids as prescribed.
6. Administer anticoagulants as prescribed.
7. Prepare to assist the HCP to administer medications to dissolve the clot, if prescribed.

VIII. Subinvolution

A. Description: Incomplete involution or failure of the **uterus** to return to its normal size and condition

B. Assessment

1. Uterine pain on palpation
2. Uterus larger than expected
3. More than normal vaginal bleeding

C. Interventions

1. Assess vital signs.
2. Assess uterus and fundus.
3. Monitor for uterine pain and vaginal bleeding.
4. Elevate legs to promote venous return.
5. Encourage frequent voiding.
6. Monitor hemoglobin and hematocrit.
7. Prepare to administer methylergonovine maleate, which provides sustained contraction of the uterus, as prescribed.

IX. Thrombophlebitis

A. Description

1. A clot forms in a vessel wall as a result of inflammation of the vessel wall.
2. A partial obstruction of the vessel can occur.
3. Increased blood-clotting factors in the postpartum period place the client at risk.
4. Early ambulation in the postoperative period after cesarean section is a preventive measure.

B. Types

1. Superficial thrombophlebitis
2. Femoral thrombophlebitis
3. Pelvic thrombophlebitis

C. Assessment (Box 30-2)

D. Interventions

1. Specific therapies may depend on the location of thrombophlebitis.
2. Assess the lower extremities for edema, tenderness, varices, and increased skin temperature.
3. Maintain bed rest.
4. Elevate the affected leg.
5. Apply a bed cradle and keep bedclothes off the affected leg.
6. Never massage the leg.
7. Monitor for manifestations of pulmonary embolism.
8. Apply hot packs or moist heat to the affected site as prescribed to alleviate discomfort.
9. Apply elastic stockings (support hose) if prescribed.
10. Administer analgesics and antibiotics as prescribed.
11. Heparin sodium intravenously may be prescribed for femoral or pelvic thrombophlebitis to prevent further thrombus formation.

BOX 30-3 Client Education for Thrombophlebitis

Never massage the leg.
 Avoid crossing the legs.
 Avoid prolonged sitting.
 Avoid constrictive clothing.
 Avoid pressure behind the knees.
 Know how to apply elastic stockings (support hose) if prescribed.
 Understand the importance of compliance with anticoagulant therapy if prescribed.
 Understand the importance of follow-up with the health care provider.

E. Client education (Box 30-3)

X. Perinatal Loss

A. Description

1. Perinatal loss is associated with miscarriage, neonatal death, stillbirth, and therapeutic abortion.
2. Loss and grief also may occur with the birth of a preterm baby, a **newborn** with complications of birth, or a newborn with congenital anomalies; it also may occur in a client who is giving up a child for adoption.

B. Interventions

! Not all interventions are appropriate for every woman and her family who has experienced perinatal loss. It is crucial to consider religious, spiritual, and cultural health care practices and beliefs when planning care for a woman and family who have experienced perinatal loss.

1. Communicate therapeutically and actively listen, providing parents time to grieve.
2. Notify the hospital chaplain or other religious person.
3. Discuss with the parents options such as seeing, holding, bathing, or dressing the deceased infant; visitation by other family members or friends; religious, spiritual, or cultural rituals; and funeral arrangements.
4. Prepare a special memories box with keepsakes such as footprints, handprints, locks of hair, and pictures, if appropriate.
5. Admit the mother to a private room; if possible, mark the door to the room with a special card (per agency procedure and maintaining confidentiality) that denotes to hospital staff that this family has experienced a loss.
6. See **Chapter 28** for additional information on intrauterine fetal demise.

BOX 30-2 Assessment of Types of Thrombophlebitis

Superficial

- Palpable thrombus that feels bumpy and hard
- Tenderness and pain in affected lower extremity
- Warm and pinkish red color over the thrombus area

Femoral

- Malaise
- Chills and fever
- Diminished peripheral pulses
- Shiny white skin over affected area
- Pain, stiffness, and swelling of affected leg

Pelvic

- Severe chills
- Dramatic body temperature changes
- Pulmonary embolism may be the first sign

CRITICAL THINKING What Should You Do?

Answer: A temperature of 100.4 °F (38 °C) is normal during the first 24 hours postpartum because of dehydration; a temperature of 100.4 °F (38 °C) or greater after 24 hours postpartum indicates infection. Therefore, if the temperature is 101.2 °F (38.4 °C) 28 hours postpartum, the nurse should report the finding to the health care provider (HCP) and immediately implement any prescriptions from the HCP.

Reference: Lowdermilk et al. (2016), pp. 478, 486.

PRACTICE QUESTIONS

308. The nurse is monitoring a client in the immediate postpartum period for signs of hemorrhage. Which sign, if noted, would be an early sign of excessive blood loss?
1. A temperature of 100.4 °F (38 °C)
 2. An increase in the pulse rate from 88 to 102 beats/minute
 3. A blood pressure change from 130/88 to 124/80 mm Hg
 4. An increase in the respiratory rate from 18 to 22 breaths/minute
- ❖ 309. The nurse is preparing a list of self-care instructions for a postpartum client who was diagnosed with mastitis. Which instructions should be included on the list? Select all that apply.
- 1. Wear a supportive bra.
 - 2. Rest during the acute phase.
 - 3. Maintain a fluid intake of at least 3000 mL/day.
 - 4. Continue to breast-feed if the breasts are not too sore.
 - 5. Take the prescribed antibiotics until the soreness subsides.
 - 6. Avoid decompression of the breasts by breast-feeding or breast pump.
310. The nurse is providing instructions about measures to prevent postpartum mastitis to a client who is breast-feeding her newborn. Which client statement would indicate a need for further instruction?
1. "I should breast-feed every 2 to 3 hours."
 2. "I should change the breast pads frequently."
 3. "I should wash my hands well before breast-feeding."
 4. "I should wash my nipples daily with soap and water."
311. The postpartum nurse is assessing a client who delivered a healthy infant by cesarean section for signs and symptoms of superficial venous thrombosis. Which sign should the nurse note if superficial venous thrombosis were present?
1. Paleness of the calf area
 2. Coolness of the calf area
 3. Enlarged, hardened veins
 4. Palpable dorsalis pedis pulses
312. A client in a postpartum unit complains of sudden sharp chest pain and dyspnea. The nurse notes that the client is tachycardic and the respiratory rate is elevated. The nurse suspects a pulmonary embolism. Which should be the initial nursing action?
1. Initiate an intravenous line.
 2. Assess the client's blood pressure.
 3. Prepare to administer morphine sulfate.
 4. Administer oxygen, 8 to 10 L/minute, by face mask.
313. The nurse is assessing a client in the fourth stage of labor and notes that the fundus is firm, but that bleeding is excessive. Which should be the initial nursing action?
1. Record the findings.
 2. Massage the fundus.
 3. Notify the health care provider (HCP).
 4. Place the client in Trendelenburg's position.
314. The nurse is preparing to care for four assigned clients. Which client is at most risk for hemorrhage?
1. A primiparous client who delivered 4 hours ago
 2. A multiparous client who delivered 6 hours ago
 3. A multiparous client who delivered a large baby after oxytocin induction
 4. A primiparous client who delivered 6 hours ago and had epidural anesthesia
315. A postpartum client is diagnosed with cystitis. The nurse should plan for which priority action in the care of the client?
1. Providing sitz baths
 2. Encouraging fluid intake
 3. Placing ice on the perineum
 4. Monitoring hemoglobin and hematocrit levels
316. The nurse is monitoring a postpartum client who received epidural anesthesia for delivery for the presence of a vulvar hematoma. Which assessment finding would best indicate the presence of a hematoma?
1. Changes in vital signs
 2. Signs of heavy bruising
 3. Complaints of intense pain
 4. Complaints of a tearing sensation

317. The nurse is creating a plan of care for a postpartum client with a small vulvar hematoma. The nurse should include which specific action during the first 12 hours after delivery?
1. Encourage ambulation hourly.
 2. Assess vital signs every 4 hours.
 3. Measure fundal height every 4 hours.
 4. Prepare an ice pack for application to the area.

318. On assessment of a postpartum client, the nurse notes that the uterus feels soft and boggy. The nurse should take which initial action?
1. Document the findings.
 2. Elevate the client's legs.
 3. Massage the fundus until it is firm.
 4. Push on the uterus to assist in expressing clots.

ANSWERS

308. 2

Rationale: During the fourth stage of labor, the maternal blood pressure, pulse, and respiration should be checked every 15 minutes during the first hour. An increasing pulse is an early sign of excessive blood loss because the heart pumps faster to compensate for reduced blood volume. A slight increase in temperature is normal. The blood pressure decreases as the blood volume diminishes, but a decreased blood pressure would not be the earliest sign of hemorrhage. The respiratory rate is slightly increased from normal.

Test-Taking Strategy: Note the **strategic word**, early. Think about the physiological occurrences of hemorrhage and shock and the expected findings in the postpartum period. This should assist in directing you to the correct option.

Review: Early signs of **hemorrhage**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Postpartum

Priority Concepts: Clotting; Perfusion

Reference: Lowdermilk et al. (2016), pp. 487, 809.

❖ 309. 1, 2, 3, 4

Rationale: Mastitis is an inflammation of the lactating breast as a result of infection. Client instructions include resting during the acute phase, maintaining a fluid intake of at least 3000 mL/day (if not contraindicated), and taking analgesics to relieve discomfort. Antibiotics may be prescribed and are taken until the complete prescribed course is finished. They are not stopped when the soreness subsides. Additional supportive measures include the use of moist heat or ice packs and wearing a supportive bra. Continued decompression of the breast by breast-feeding or breast pump is important to empty the breast and prevent the formation of an abscess.

Test-Taking Strategy: Focus on the **subject**, treatment measures for mastitis. Think about the pathophysiology associated with mastitis to answer correctly. Recalling that supportive measures include rest, moist heat or ice packs, antibiotics, analgesics, increased fluid intake, breast support, and decompression of the breasts will assist in answering the question.

Review: Treatment measures for **mastitis**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Maternity—Postpartum

Priority Concepts: Client Education; Inflammation

Reference: Lowdermilk et al. (2016), pp. 490, 625.

310. 4

Rationale: Mastitis is inflammation of the breast as a result of infection. It generally is caused by an organism that enters through an injured area of the nipples, such as a crack or blister. Measures to prevent the development of mastitis include changing nursing pads when they are wet and avoiding continuous pressure on the breasts. Soap is drying and could lead to cracking of the nipples, and the client should be instructed to avoid using soap on the nipples. The mother is taught about the importance of hand washing and that she should breast-feed every 2 to 3 hours.

Test-Taking Strategy: Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and the need to select the option that identifies the incorrect client statement. Recalling that the use of soap is drying to the skin and could cause cracking and provide an entry point for organisms will direct you easily to the correct option.

Review: Prevention measures for **mastitis**

Level of Cognitive Ability: Evaluating

Client Needs: Health Promotion and Maintenance

Integrated Process: Teaching and Learning

Content Area: Maternity—Postpartum

Priority Concepts: Client Education; Inflammation

Reference: Lowdermilk et al. (2016), pp. 489, 624–625.

311. 3

Rationale: Thrombosis of superficial veins usually is accompanied by signs and symptoms of inflammation, including swelling, redness, tenderness, and warmth of the involved extremity. It also may be possible to palpate the enlarged, hard vein. Clients sometimes experience pain when they walk. Palpable dorsalis pedis pulses is a normal finding.

Test-Taking Strategy: Eliminate option 4 first, because this is a normal and expected finding. Next, eliminate options 1 and 2 because they are **comparable or alike**.

Review: **Superficial venous thrombosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Postpartum

Priority Concepts: Clotting; Perfusion

Reference: Lowdermilk et al. (2016), pp. 811–812.

312. 4

Rationale: If pulmonary embolism is suspected, oxygen should be administered, 8 to 10 L/minute, by face mask. Oxygen is used to decrease hypoxia. The client also is kept on bed rest with the head of the bed slightly elevated to reduce dyspnea. Morphine sulfate may be prescribed for the client, but this would not be the initial nursing action. An intravenous

line also will be required, and vital signs need to be monitored, but these actions would follow the administration of oxygen.
 Test-Taking Strategy: Note the **strategic word**, initial. Use the **ABCs—airway—breathing—circulation**—to assist in directing you to the correct option.

Review: Therapeutic management of a client with **pulmonary embolism**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Gas Exchange; Perfusion

Reference: Lowdermilk et al. (2016), p. 811.

313. 3

Rationale: If bleeding is excessive, the cause may be laceration of the cervix or birth canal. Massaging the fundus if it is firm would not assist in controlling the bleeding. Trendelenburg's position should be avoided because it may interfere with cardiac and respiratory function. Although the nurse would record the findings, the initial nursing action would be to notify the HCP.

Test-Taking Strategy: Note the **strategic word**, initial. Focus on the **data in the question**, noting the clinical manifestations identified in the question. Eliminate option 2 first because, if the uterus is firm, it would not be necessary to perform fundal massage. Knowing that Trendelenburg's position interferes with cardiac and respiratory function will assist in eliminating option 4. From the remaining options, noting the words bleeding is excessive will assist in directing you to the correct option.

Review: Nursing interventions for **postpartum hemorrhage**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clinical Judgment; Clotting

Reference: Lowdermilk et al. (2016), pp. 486, 803.

314. 3

Rationale: The causes of postpartum hemorrhage include uterine atony; laceration of the vagina; hematoma development in the cervix, perineum, or labia; and retained placental fragments. Predisposing factors for hemorrhage include a previous history of postpartum hemorrhage, placenta previa, abruptio placentae, overdistention of the uterus from polyhydramnios, multiple gestation, a large neonate, infection, multiparity, dystocia or labor that is prolonged, operative delivery such as a cesarean or forceps delivery, and intrauterine manipulation. The multiparous client who delivered a large fetus after oxytocin induction has more risk factors associated with postpartum hemorrhage than the other clients. In addition, there are no specific data in the client descriptions in options 1, 2, and 4 that present the risk for hemorrhage.

Test-Taking Strategy: Note the **strategic word**, most. Focus on the **subject**, the client at most risk for hemorrhage. Read the client description in each option. Noting the words large and oxytocin in the correct option will direct you to this option.

Review: **Hemorrhage** and **postpartum client**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Postpartum

Priority Concepts: Clinical Judgment; Clotting

Reference: Lowdermilk et al. (2016), pp. 486, 810.

315. 2

Rationale: Cystitis is an infection of the bladder. The client should consume 3000 mL of fluids per day if not contraindicated. Sitz baths and ice would be appropriate interventions for perineal discomfort. Hemoglobin and hematocrit levels would be monitored with hemorrhage.

Test-Taking Strategy: Focus on the **subject**, measures to treat cystitis, and note the **strategic word**, priority. Remember that increased fluids are a priority intervention.

Review: Interventions for a client with **cystitis**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Postpartum

Priority Concepts: Elimination; Infection

Reference: Lowdermilk et al. (2016), pp. 813–814.

316. 1

Rationale: Because the client has had epidural anesthesia and is anesthetized, she cannot feel pain, pressure, or a tearing sensation. Changes in vital signs indicate hypovolemia in an anesthetized postpartum client with vulvar hematoma. Option 2 (heavy bruising) may be seen, but vital sign changes indicate hematoma caused by blood collection in the perineal tissues. Test-Taking Strategy: Note the **strategic word**, best. Also note that the client received epidural anesthesia. With this in mind, eliminate options 3 and 4. From the remaining options, use the **ABCs—airway—breathing—circulation**—to direct you to the correct option.

Review: Signs of a **vulvar hematoma**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Maternity—Postpartum

Priority Concepts: Clinical Judgment; Clotting

Reference: Lowdermilk et al. (2016), pp. 804, 809.

317. 4

Rationale: A hematoma is a localized collection of blood in the tissues of the reproductive sac after delivery. Vulvar hematoma is the most common. Application of ice reduces swelling caused by hematoma formation in the vulvar area. Options 1, 2, and 3 are not interventions that are specific to the plan of care for a client with a small vulvar hematoma. Ambulation hourly increases the risk for bleeding. Client assessment every 4 hours is too infrequent.

Test-Taking Strategy: Focus on the **subject**, a small vulvar hematoma. Think about the effect of each action in the options; this focus will assist in directing you to the correct option.

Review: Nursing care of the client with a **hematoma**

Level of Cognitive Ability: Creating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Maternity—Postpartum

Priority Concepts: Clinical Judgment; Clotting

Reference: Lowdermilk et al. (2016), pp. 488–489.

318. 3

Rationale: If the uterus is not contracted firmly (i.e., it is soft and boggy), the initial intervention is to massage the fundus until it is firm and to express clots that may have accumulated in the uterus. Elevating the client's legs would not assist in managing uterine atony. Documenting the findings is an appropriate action, but is not the initial action. Pushing on an uncontracted uterus can invert the uterus and cause massive hemorrhage.

Test-Taking Strategy: Note the **strategic word**, initial, in the question. Focus on the **subject**, that the uterus is soft and boggy. Recalling the therapeutic management for uterine atony will assist in directing you to the correct option.

Review: Therapeutic management of the client with **uterine atony**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Postpartum

Priority Concepts: Clinical Judgment; Reproduction

Reference: Lowdermilk et al. (2016), pp. 486, 803.

Care of the Newborn

PRIORITY CONCEPTS Development, Health Promotion

CRITICAL THINKING What Should You Do?

The nurse is performing an initial assessment on a newborn and notes that the newborn is experiencing tremors. What should the nurse do?

Answer located on p. 388.

I. Initial Care of the Newborn

A. Assessment

1. Observe or assist with initiation of respirations.
2. Assess Apgar score.
3. Note characteristics of cry.
4. Monitor for nasal flaring, grunting, retractions, and abnormal respirations, such as a seesaw respiratory pattern (rise and fall of the chest and abdomen do not occur together).
5. Assess for central cyanosis and acrocyanosis.
6. Obtain vital signs.
7. Observe the newborn for signs of hypothermia or hyperthermia.
8. Assess for gross anomalies.

B. Interventions

1. Suction the mouth first and then the nares with a bulb syringe.
2. Dry the newborn and stimulate crying by rubbing the back.
3. Maintain temperature stability; wrap the newborn in warm blankets and place a stockinette cap on the newborn's head.
4. Keep the newborn with the mother to facilitate bonding.
5. Place the newborn at the mother's breast if breast-feeding is planned, or place the newborn on the mother's abdomen.
6. Place the newborn in a radiant warmer.
7. Position the newborn on the side with a rolled blanket at the back to facilitate drainage of mucus.

8. Ensure the newborn's proper identification.
9. Footprint the newborn and fingerprint the mother on the identification sheet per agency policies and procedures; initiate other agency identification and safety procedures.
10. Place matching identification bracelets on the mother and the newborn.

C. Apgar scoring system

1. Assess each of 5 items to be scored and add the points to determine the newborn's total score.
2. Five vital indicators (Table 31-1)
3. Interventions: Apgar score (Table 31-2)

! The newborn's Apgar score is routinely assessed and recorded at 1 minute and 5 minutes after birth, and at 10 minutes if needed.

II. Initial Physical Examination

A. General guidelines

1. Keep the newborn warm during the examination.
2. Begin with general observations, and then perform assessments that are least disturbing to the newborn first.
3. Initiate nursing interventions for abnormal findings and document findings.
4. The Ballard Scale may be used for gestational age assessment; in this scale, scores are assigned to physical and neurological criteria.

! The phases of newborn instability occur during the first 6 to 8 hours after birth and are known as the transition period between intrauterine and extrauterine existence. These phases include the first period of reactivity, period of decreased responsiveness, and second period of reactivity.

B. Vital signs

1. Heart rate (resting): 120 to 160 beats/minute (apical), 80 to 100 beats/minute (if sleeping), up to 180 beats/minute (if crying); auscultate at the fourth intercostal space for 1 full minute to detect abnormalities.

TABLE 31-1 Five Vital Indicators of Apgar Scoring

Indicator	0 Points	1 Point	2 Points
Heart rate	Absent	< 100 beats/min	! 100 beats/min
Respiratory rate and effort	Absent	Slow, irregular breathing, weak cry	Good rate and effort, vigorous cry
Muscle tone	Flaccid, limp	Minimal flexion of extremities	Good flexion, active motion
Reflex irritability	No response	Minimal response (grimace) to suction or to gentle slap on soles	Responds promptly with a cry or active movement
Skin color	Pallor or cyanosis	Body skin color normal, extremities blue	Body and extremity skin color normal

TABLE 31-2 Apgar Score Interventions

Score	Intervention
8-10	No intervention required except to support newborn's spontaneous efforts
4-7	Stimulate; rub newborn's back; administer oxygen to newborn; rescore at specific intervals
0-3	Newborn requires full resuscitation; rescore at specific intervals

- Respirations: 30 to 60 breaths/minute; assess for 1 full minute.
- Assess heart rate and respiratory rate first before assessing other vital signs while the newborn is resting or sleeping.
- Axillary temperature: 96.8°F (37°C) to 99°F (37.2°C)
- Blood pressure: Usually not done in term newborn, 80–90/40–50 mm Hg

C. Body measurements (approximate)

- Length: 18 to 22 inches (45 to 55 cm)
- Weight: 2500 to 4000 g (5.5 to 8.75 lb)
- Head circumference: 33 to 35 cm (13.2 to 14 inches)

D. Head

- Head should be one fourth of the body length (cephalocaudal development).
- Bones of the skull are not fused.
- Sutures (connective tissue between the skull bones) are palpable and may be overlapping because of head molding, but should not be widened.
- Fontanelles are unossified membranous tissue at the junction of the sutures (Table 31-3).

TABLE 31-3 Fontanelles

Fontanel	Characteristics	Closure
Anterior	Soft, flat, diamond-shaped; 3-4 cm wide × 2-3 cm long	Between 12 and 18 mo of age
Posterior	Triangular; 0.5-1 cm wide Located between occipital and parietal bones	Between birth and 2-3 mo of age

- Molding is asymmetry of the head resulting from pressure in the birth canal; molding disappears in about 72 hours (Fig. 31-1).
- Masses from birth trauma
 - Caput succedaneum is edema of the soft tissue over bone (crosses over suture line); it subsides within a few days.
 - Cephalhematoma is swelling caused by bleeding into an area between the bone and its periosteum (does not cross over suture line); it usually is absorbed within 6 weeks with no treatment.

FIGURE 31-1 Molding. A, Significant molding after vaginal birth. B, Schematic of bones of skull when molding is present. (A, From Perry et al, 2010. Courtesy Kim Molloy, Knoxville, Iowa.)

7. Head lag
 - a. Common when pulling the newborn to a sitting position
 - b. When prone, the newborn should be able to lift the head slightly and turn the head from side to side.

E. Eyes

1. Slate gray (light skin), dark blue, or brown-gray (dark skin)
2. Symmetrical and clear
3. Pupils equal, round, react to light and accommodation
4. Blink reflex present
5. Eyes cross because of weak extraocular muscles
6. Ability to track and fixate momentarily
7. Red reflex present
8. Eyelids often edematous as a result of pressure during the birth process and the effects of eye medication

F. Ears

1. Symmetrical
2. Firm cartilage with recoil
3. Top of pinna on or above line drawn from outer canthus of eye
4. Low-set ears associated with Down syndrome, renal anomalies, or other genetic or chromosomal syndromes

G. Nose

1. Flat, broad, in center of face
2. Obligatory nose breathing
3. Occasional sneezing to remove obstructions
4. Nares are patent and should not flare (flaring is an indication of respiratory distress).

H. Mouth

1. Pink, moist gums
2. Soft and hard palates intact
3. Epstein's pearls (small, white cysts) may be present on hard palate.
4. Uvula in midline
5. Freely moving tongue, symmetrical, has short frenulum
6. Sucking and crying movements symmetrical
7. Able to swallow
8. Root and gag reflexes present

When assessing the newborn's mouth, look for the presence of thrush (*Candida albicans*), which are white patchy areas on the tongue or gums that cannot be removed with a washcloth; these may be painful.

I. Neck

1. Short and thick
2. Head held in midline
3. Trachea midline
4. Good range of motion and ability to flex and extend

5. Assess for torticollis (head inclined to 1 side as a result of contraction of muscles on that side of the neck)

J. Chest

1. Circular appearance because anteroposterior and lateral diameters are about equal (approximately 30 to 33 cm [12 to 13.2 inches] at birth)
2. Diaphragmatic respirations—chest and abdomen should rise and fall in synchrony, not in seesaw pattern
3. Bronchial sounds heard on auscultation
4. Nipples prominent and often edematous; milky secretion (witch's milk) common
5. Breast tissue present
6. Clavicles need to be palpated to assess for fractures.

K. Skin

1. Pinkish red (light-skinned newborn) to pinkish brown or pinkish yellow (dark-skinned newborn)
2. Vernix caseosa, a cheesy white substance, on entire body in preterm newborns, but is more prominent between folds closer to term; may be absent after 42 weeks of gestation
3. Lanugo, fine body hair, might be seen, especially on the back.
4. Milia, small white sebaceous glands, appear on the forehead, nose, and chin.
5. Dry, peeling skin, increased in postmature newborns
6. Dark red color (plethoric) common in premature newborns
7. Cyanosis may be noted with hypothermia, infection, and hypoglycemia and with cardiac, respiratory, or neurological abnormalities.
8. Acrocyanosis (peripheral cyanosis of hands and feet) is normal in the first few hours after birth and may be noted intermittently for the next 7 to 10 days (Fig. 31-2).
9. Assess for ecchymosis and petechiae resulting from trauma of birth.
10. Assess skin turgor over the abdomen to determine hydration status.

FIGURE 31-2 Acrocyanosis. (From McKinney et al., 2013. Courtesy Todd Shiros, Santa Fe Springs, California.)

11. Observe for forceps marks.
12. Harlequin sign
 - a. Deep pink or red color develops over 1 side of newborn's body while the other side remains pale or of normal color.
 - b. Harlequin sign may indicate shunting of blood that occurs with a cardiac problem or may indicate sepsis.
13. Birthmarks (Table 31-4)

L. Abdomen

1. Umbilical cord
 - a. Umbilical cord should have 3 vessels—2 arteries and 1 vein; if fewer than 3 vessels are noted, notify the health care provider (HCP).
 - b. While a 2-vessel cord (1 artery, 1 vein) may present no problems or concerns, there is a higher correlation to intrauterine growth restriction (IUGR) and genetic or chromosomal problems.
 - c. Small, thin cord may be associated with poor fetal growth.

- d. Assess for intact cord, and ensure that the cord clamp is secured.
- e. Cord should be clamped for at least the first 24 hours after birth; clamp can be removed when the cord is dried and occluded and is no longer bleeding.
- f. Note any bleeding or drainage from the cord.
- g. Cleansing of the cord needs to be done; hospital protocol and HCP's preference determine the frequency, technique, and skin preparation used for cord care.
- h. If signs of infection, such as moistness, oozing, discharge, and a reddened base, occur, antibiotic treatment is prescribed.

2. Gastrointestinal

- a. Monitor cord for meconium staining.
- b. Assess for umbilical hernia.
- c. Assess for abdominal depression associated with diaphragmatic hernia.
- d. Assess for abdominal distention associated with obstruction, mass, or sepsis.
- e. Monitor bowel sounds (present within the first hour after birth).

3. Anus

- a. Ensure that the anal opening is present.
- b. First stool meconium should pass within first 24 hours.

M. Genitals

1. Female

- a. Labia may be swollen; clitoris may be enlarged.
- b. Smegma may be present (thick, white mucus discharge).
- c. Pseudomenstruation, caused by the withdrawal of the maternal hormone estrogen, is possible (blood-tinged mucus).
- d. Hymen tag may be visible.
- e. First voiding should occur within 24 hours.

2. Male

- a. Prepuce (foreskin) covers glans penis.
- b. Scrotum may be edematous.
- c. Verify meatus at tip of penis.
- d. Testes are descended, but may retract with cold.
- e. Assess for hernia or hydrocele.
- f. First voiding should occur within 24 hours.

N. Spine

1. Straight
2. Posture flexed
3. Supportive of head momentarily when prone
4. Chin flexed on upper chest
5. Well-coordinated, sporadic movements
6. A degree of hypotonicity or hypertonicity may indicate central nervous system damage.
7. Assess for hair tufts and dimples along the spinal column (may be indicative of a possible opening).

TABLE 31-4 Birthmarks

Birthmark	Characteristics
Telangiectatic nevi (stork bites)	Pale pink or red, flat, dilated capillaries
	On eyelids, nose, lower occipital bone, and nape of neck
	Blanch easily
	More noticeable during crying periods
	Disappear by age 2 yr
Nevus flammeus (port-wine stain)	Capillary angioma directly below epidermis
	Nonelevated, sharply demarcated, red to purple, dense areas of capillaries
	Commonly appear on face
	No fading with time
	May require future surgery
Nevus vasculosus (strawberry mark)	Capillary hemangioma
	Raised, clearly delineated, dark red, with rough surface
	Common in head region
	Disappears by age 7-9 yr
Mongolian spots	Bluish black pigmentation
	On lumbar dorsal area and buttocks
	Gradually fade during first and second years of life
	Common in Asian and dark-skinned individuals

O. Extremities

1. Flexed
2. Full range of motion; symmetrical movements
3. Fists clenched
4. Ten fingers and 10 toes, all separate
5. Legs bowed
6. Major gluteal folds even
7. Creases on soles of feet
8. Assess for fractures (especially clavicle) or dislocations (hip).
9. Assist HCP to assess for developmental dysplasia of the hip; when thighs are rotated outward, no clicks should be heard (Ortolani's sign and Barlow's sign are the 2 assessment tools for developmental dysplasia of the hip).
10. Pulses palpable (radial, brachial, femoral)

 Slight tremors noted in the newborn may be a common finding, but could also be a sign of hypoglycemia, hypocalcemia, or drug withdrawal.

III. Body Systems Assessment and Interventions

A. Cardiovascular system

1. Keep the newborn warm.
2. Measure the apical heart rate for 1 full minute.
3. Listen for murmurs; assess oxygen saturation via pulse oximetry if a murmur is heard.
4. Palpate pulses.
5. Assess for cyanosis; blanch the skin on the trunk and extremities to assess circulation.
6. Observe for cardiac distress when the newborn is feeding.

B. Respiratory system

1. Suction the airway as necessary: Use a bulb syringe for upper airway suctioning (compress bulb before insertion) and a French catheter for deeper suctioning.
2. Observe for respiratory distress and hypoxemia.
 - a. Nasal flaring
 - b. Increasingly severe retractions
 - c. Grunting
 - d. Cyanosis
 - e. Bradycardia and periods of apnea lasting longer than 15 seconds
3. Administer oxygen if necessary and as prescribed.

C. Hepatic system

1. Normal or physiological jaundice appears after the first 24 hours in full-term newborns and after the first 48 hours in premature newborns; jaundice occurring before this time (pathological jaundice) may indicate early hemolysis of red blood cells and must be reported to the HCP.
2. Physiological jaundice peaks on about the fifth day of life (indirect bilirubin levels 6 to 7 mg/dL [90 to 105 $\mu\text{mol/L}$]).
3. Feed early to stimulate intestinal activity and to keep the bilirubin level low.

4. Prevent chilling because hypothermia can cause acidosis that interferes with bilirubin conjugation and excretion.
5. Liver stores the iron passed from the mother for 5 to 6 months.
6. Glycogen storage occurs in the liver.
7. The newborn is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on vitamin K, which is not synthesized until intestinal bacteria are present.
8. Handle the newborn carefully and monitor for any bruising or bleeding episodes.
9. Watch for meconium stool and subsequent stools.
10. Administer intramuscular dose of phytonadione to the newborn as prescribed to prevent hemorrhagic disorders (usually 0.5 to 1 mg is prescribed); administer in lateral aspect of the middle third of the vastus lateralis muscle (see Chapter 32).
11. Assess the newborn's hemoglobin and blood glucose levels.

D. Renal system

1. The immature kidneys are unable to concentrate urine.
2. A weight loss of 5% to 10% during the first week of life occurs as a result of water loss and limited intake; birth weight should be regained by 10 to 14 days after birth.
3. Weigh the newborn daily.
4. Monitor intake and output; weigh diapers if necessary (1 g of diaper weight equals 1 mL of urine).
5. If the diaper requires weighing, record the weight before putting it on the newborn; after the newborn voids, reweigh the diaper and subtract the prevoided weight.
6. Assess for signs of dehydration (dry mucous membranes, sunken eyeballs, poor skin turgor, sunken fontanels).

E. Immune system

1. Newborn receives passive immunity via the placenta (immunoglobulin G).
2. Newborn receives passive immunity from colostrum (immunoglobulin A).
3. Elevations in immunoglobulin M indicate infection in utero.
4. Use aseptic technique and standard precautions when caring for the newborn.
5. Ensure meticulous hand washing.
6. Ensure that an infection-free staff cares for the newborn.
7. Monitor the newborn's temperature.
8. Observe for any cracks or openings in the skin.
9. Administer eye medication within 1 hour after birth to prevent ophthalmia neonatorum (see Chapter 32).

10. Provide cord care.
 - a. Umbilical clamp can be removed after 24 hours if cord is dried and occluded and is not bleeding.
 - b. Teach the mother how to perform cord care.
 - c. Keep the cord clean and dry; soap and water may be prescribed for cleaning the cord.
 - d. Keep the diaper from covering the cord; fold the diaper below the cord.
 - e. Assess cord for odor, edema, or discharge.
 - f. The newborn is typically washed via a sponge bath until the cord falls off (within 2 weeks). Follow alternate instructions if provided by HCP.

11. Provide circumcision care.
 - a. Apply petroleum jelly gauze to the penis except when a PlastiBell is used.
 - b. Remove petroleum jelly gauze, if applied, after the first voiding following circumcision.
 - c. Observe for edema, infection, or bleeding from the circumcision site.
 - d. Teach the mother how to care for the circumcision site.
 - e. Clean the penis after each voiding by squeezing warm water over the penis.
 - f. A milky covering over the glans penis is normal and should not be disrupted.
 - g. Monitor for urinary retention.

F. Metabolic system and gastrointestinal system

1. Newborns are able to digest simple carbohydrates, but are unable to digest fats because of the lack of lipase.
2. Proteins may be broken down only partially, so they may serve as antigens and provoke an allergic reaction.
3. The newborn has a small stomach capacity (less than 10 mL at birth, increasing to about 90 mL by day 10), with rapid intestinal peristalsis (bowel emptying time is 2.5 to 3 hours).
4. Breast-feeding usually can begin immediately after birth; based on HCP preference and agency protocols, bottle-fed newborns may be initially offered no more than 30 mL of formula.
5. Observe feeding reflexes, such as rooting, sucking, and swallowing.
6. Assist the mother with breast-feeding or formula feeding; breast-feeding should be done every 2 to 3 hours, and formula feeding (minimum of 30 mL, or 1 oz by day 3) should be done every 3 to 4 hours (or per HCP preference or agency protocols).
7. Burp the newborn during and after feeding.
8. Assess for regurgitation or vomiting.
9. Position the newborn on the right side after feeding; however, the side-lying position is not recommended for sleep because this position makes it easy for the newborn to roll to

the prone position (prone position is contraindicated because the prone position increases the risk of sudden infant death syndrome).

10. Observe for normal stool and the passage of meconium.
 - a. Meconium stool, which is greenish black with a thick, sticky, tarlike consistency, usually is passed within the first 24 hours of life.
 - b. Transitional stool, the second type of stool excreted by the newborn, is greenish brown and of looser consistency than meconium.
 - c. Seedy, yellow stools are usually noted in breast-fed newborns; pale yellow to light brown stools are usually seen in formula-fed newborns.
11. Perform a newborn screening test (including the test for phenylketonuria [PKU]) as prescribed before discharge after sufficient protein intake occurs; the newborn should be on formula or breast milk for 24 hours before screening.

G. Neurological system

1. Newborn head size is proportionally larger than that of an adult because of cephalocaudal development.
2. Myelination of nerve fibers is incomplete, so primitive reflexes are present.
3. Fontanelles are open to allow for brain growth.
4. Assess for abnormal head size and a bulging or depressed anterior fontanel.
5. Measure and graph the head circumference in relation to chest circumference and length.
6. Assess the newborn's movements, noting symmetry, posture, and abnormal movements.
7. Observe for jitteriness, marked tremors, and seizures.
8. Test the newborn's reflexes.
9. Assess for lethargy.
10. Assess pitch of cry.

H. Thermal regulatory system

1. Prevent cold stress (Fig. 31-3).
2. Newborns do not shiver to produce heat.
3. Newborns have brown fat deposits, which produce heat.
4. Prevent heat loss resulting from evaporation by keeping the newborn dry and well wrapped with a blanket.
5. Prevent heat loss resulting from radiation by keeping the newborn away from cold objects and outside walls.
6. Prevent heat loss resulting from convection by shielding the newborn from drafts.
7. Prevent heat loss resulting from conduction by performing all treatments on a warm, padded surface.
8. Keep the room temperature warm.
9. Take the newborn's axillary temperature every hour for the first 4 hours of life, every 4 hours

FIGURE 31-3 Effects of cold stress. When a newborn is stressed by cold, oxygen (O_2) consumption increases and pulmonary and peripheral vasoconstriction occur, decreasing O_2 uptake by the lungs and O_2 delivery to the tissues; anaerobic glycolysis increases; and there is a decrease in partial pressure of oxygen (PO_2) and pH, leading to metabolic acidosis.

for the remainder of the first 24 hours, and then every shift (as per agency protocol).

! Cold stress causes oxygen consumption and energy to be diverted from maintaining normal brain cell function and cardiac function, resulting in serious metabolic and physiological conditions.

I. Reflexes

1. Sucking and rooting

- Touch the newborn's lip, cheek, or corner of the mouth with a nipple.
- The newborn turns the head toward the nipple, opens the mouth, takes hold of the nipple, and sucks.
- Rooting reflex usually disappears after 3 to 4 months, but may persist for 1 year.

2. Swallowing reflex

- Swallowing reflex occurs spontaneously after sucking and obtaining fluids.
- Newborn swallows in coordination with sucking without gagging, coughing, or vomiting.

3. Tonic neck or fencing

- While the newborn is falling asleep or sleeping, gently and quickly turn the head to 1 side.
- As the newborn faces the left side, the left arm and leg extend outward while the right arm and leg flex.

- When the head is turned to the right side, the right arm and leg extend outward while the left arm and leg flex.
 - Response usually disappears within 3 to 4 months.
- Palmar-plantar grasp
 - Place a finger in the palm of the newborn's hand and then place a finger at the base of the toes.
 - The newborn's fingers curl around the examiner's fingers, and the newborn's toes curl downward.
 - Palmar response lessens within 3 to 4 months.
 - Plantar response lessens within 8 months.
 - Moro reflex (also known as the startle reflex)
 - Hold the newborn in a semisitting position and then allow the head and trunk to fall backward to at least a 30-degree angle.
 - The newborn assumes sharp extension and abduction of the arms with the thumbs and forefingers in a "C" position; this is followed by flexion and adduction to an "embrace" position (legs follow a similar pattern).
 - The Moro reflex is present at birth and is absent by 6 months of age if neurological maturation is not delayed.
 - A body jerk motion may be the response between 8 and 18 weeks.
 - A persistent response lasting more than 6 months may indicate a neurological abnormality.
 - Startle reflex (often considered the same as the Moro reflex)
 - The response is best elicited if the newborn is at least 24 hours old.
 - The examiner makes a loud noise or claps hands to elicit the response.
 - The newborn's arms adduct while the elbows flex.
 - The hands stay clenched.
 - The reflex should disappear within 4 months.
 - Pull-to-sit response
 - Pull the newborn up by the wrist while the newborn is in the supine position.
 - The head lags until the newborn is in an upright position, and then the head is level with the chest and shoulders momentarily before falling forward.
 - The head then lifts for a few minutes.
 - The response depends on the newborn's general muscle tone and condition and on maturity level.
 - Babinski sign: Plantar reflex
 - Beginning at the heel of the foot, use a finger to stroke gently upward along the lateral aspect of the sole, and then move the finger along the ball of the foot.

- b. The newborn's toes hyperextend while the big toe dorsiflexes.
 - c. The reflex disappears after the newborn is 1 year old.
 - d. Absence of this reflex indicates the need for a neurological examination.
9. Stepping or walking
- a. Hold the newborn in a vertical position, allowing 1 foot to touch a table surface.
 - b. The newborn simulates walking, alternately flexing and extending the feet.
 - c. The reflex is usually present for 3 to 4 months.
10. Crawling
- a. Place the newborn on the abdomen.
 - b. The newborn begins to make crawling movements with the arms and legs.
 - c. The reflex usually disappears after about 6 weeks.

IV. Newborn Safety

A. Newborn identification

1. Information bracelets are applied to the mother and newborn immediately after birth and before the mother and newborn are separated; in addition, identification pictures of the newborn and footprints from the newborn may be obtained before the newborn leaves the mother's side in the delivery room.
2. The bracelets include name, sex, date, time of birth, and identification numbers.
3. Some agencies use identification bracelets that have radiofrequency transmitters that set off alarms if the newborn is removed from a certain area.
4. Agencies also conduct unit and hospital-wide drills to prevent newborn abductions.

B. Newborn abduction

1. The mother is taught to check the identification of any person who comes to remove the infant from her room and is taught other precautions to prevent newborn abduction (nurses must be wearing photo identification or some other security badge) (Box 31-1).
2. Closed-circuit televisions, code-alert bands, computer monitoring systems, or other monitoring systems may be used in some agencies.
3. The newborn is wheeled in a bassinette, not carried in a staff member's arms.

V. Parent Teaching

A. Formula feeding

1. Teach sterilization techniques if the water supply is located in areas where the purification process of the water is questionable.
2. Remind the mother not to heat the bottle of formula in a microwave oven.
3. Inform the mother that formula is a sufficient diet for the first 4 to 6 months.
4. Assess the mother's ability to burp the newborn.

BOX 31-1 Precautions to Prevent Infant Abduction

All personnel must wear identification that is easily visible at all times.

Teach parents to allow only hospital staff with proper identification to take their infants from them.

Question anyone with a newborn near an exit or in an unusual part of the facility.

Never leave a newborn unattended.

Teach the parents that the newborn must be observed at all times.

When the newborn is in the mother's room, position the crib away from the doorway.

Teach the parents home safety precautions; suggest that the parents not place announcements in the paper or signs in their yard that might alert an abductor that a new infant is in the home.

B. Breast-feeding

1. Assess the newborn's ability to attach to the mother's breast and suck (Fig. 31-4).
2. Teach the mother how to pump her breasts and how to store breast milk properly.
3. Inform the mother that breast milk is a sufficient diet for the first 4 to 6 months.
4. Give the mother the phone numbers of local organizations that offer support to breast-feeding mothers.

C. Bathing

1. Bathe the newborn in a warm room before feeding.
2. Have all equipment for bathing available.
3. Use a mild soap (not on the face).
4. Proceed from the cleanest area to the dirtiest.
5. Clean eyes from the inner canthus outward.
6. Special care should be taken to clean under the folds of the neck, underarms, groin, and genitals.

FIGURE 31-4 Correct attachment (latch-on) of a newborn at breast.

7. Make bath time enjoyable for the newborn and the mother.

D. Clothing

1. Assess diaper and clothing needs for the newborn with the mother.
2. Instruct the mother that the newborn's head should be covered in cold weather to prevent heat loss.
3. Instruct the mother to layer the newborn's clothing in cooler weather.
4. To be comfortable, the newborn should be dressed in 1 more layer of clothing than what the parents are wearing.

E. Cord care: See earlier for cord care, "Body Systems Assessment and Interventions."

F. Circumcision: See earlier for circumcision care, "Body Systems Assessment and Interventions."

G. Uncircumcised newborn

1. Inform the mother that the foreskin and glans are 2 similar layers of cells that separate from each other and that the separation process normally is complete by 3 years of age, although the layers can remain adhered until puberty.
2. Instruct the mother not to pull back the foreskin, but to allow natural separation to occur.
3. Inform the mother that as the process of separation occurs, sloughed cells build up between the layers of the foreskin and the glans, and that when retraction occurs, daily gentle washing of the glans with soap and water is sufficient to maintain adequate cleanliness.
4. Providing stimulation to the newborn such as touching, cuddling, or talking is an important intervention.

VI. Preterm Newborn

A. Description

1. An infant born before 37 weeks of gestation
2. Primary concern relates to immaturity of all body systems

B. Assessment

1. Respirations are irregular with periods of apnea.
2. Body temperature is below normal.
3. The newborn has poor suck and swallow reflexes.
4. Bowel sounds are diminished.
5. Urinary output is increased or decreased.
6. Extremities are thin, with minimal creasing on soles and palms.
7. The newborn extends extremities and does not maintain flexion.
8. Lanugo, on skin and in the hair on the newborn's head, is present in woolly patches.
9. Skin is thin, with visible blood vessels and minimal subcutaneous fat pads.
10. Skin may appear jaundiced.
11. Testes are undescended in boys.
12. Labia are narrow in girls.

C. Interventions

1. Monitor vital signs every 2 to 4 hours.

2. Maintain airway and cardiopulmonary functions.
3. Administer oxygen and humidification as prescribed.
4. Monitor intake and output and electrolyte balance.
5. Monitor daily weight.
6. Maintain the newborn in a warming device.
7. Avoid exposure to infections.

VII. Postterm Newborn

A. Description: Infant born after 42 weeks of gestation

B. Assessment

1. Hypoglycemia
2. Parchment-like skin (dry and cracked) without lanugo
3. Long fingernails, extended over ends of fingers
4. Profuse scalp hair
5. Long and thin body
6. Wasting of fat and muscle in extremities
7. Meconium staining possibly present on nails and umbilical cord

C. Interventions

1. Provide normal newborn care.
2. Monitor for hypoglycemia.
3. Maintain newborn's temperature.
4. Monitor for meconium aspiration.

VIII. Small for Gestational Age

A. Description: Newborn who is plotted at or below the 10th percentile on the intrauterine growth curve

B. Assessment

1. Fetal distress
2. Decreased or elevated body temperature
3. Physical abnormalities
4. Hypoglycemia
5. Signs of polycythemia
 - a. Ruddy appearance
 - b. Cyanosis
 - c. Jaundice
6. Signs of infection
7. Signs of aspiration of meconium

C. Interventions

1. Maintain airway and cardiopulmonary function.
2. Maintain body temperature.
3. Observe for signs of respiratory distress.
4. Monitor for infection and initiate measures to prevent sepsis.
5. Monitor for hypoglycemia.
6. Initiate early feedings and monitor for signs of aspiration.

IX. Large for Gestational Age

A. Description: Newborn who is plotted at or above the 90th percentile on the intrauterine growth curve

B. Assessment

1. Birth trauma or injury
2. Respiratory distress
3. Hypoglycemia

 C. Interventions

1. Monitor vital signs and for respiratory distress.
2. Monitor for hypoglycemia.
3. Initiate early feedings.
4. Monitor for infection and initiate measures to prevent sepsis.
5. Provide stimulation, such as touch and cuddling.

 X. Respiratory Distress Syndrome

A. Description: Serious lung disorder caused by immaturity and inability to produce **surfactant**, resulting in hypoxia and acidosis

B. Assessment

1. Respiratory distress; can include tachypnea, nasal flaring, expiratory grunting, retractions, seesaw respirations, decreased breath sounds, and apnea
2. Pallor and cyanosis
3. Hypothermia
4. Poor muscle tone

C. Interventions

1. Monitor color, respiratory rate, and degree of effort in breathing.
2. Maintain airway and cardiopulmonary function and support respirations as prescribed.
3. Monitor arterial blood gases and oxygen saturation levels as prescribed (arterial blood gases from umbilical artery); ensure that oxygen administered to the newborn is at the lowest possible concentration necessary to maintain adequate arterial oxygenation.
4. Any premature **newborn** who required oxygen support should be scheduled for an eye examination before discharge to assess for retinal damage.
5. Suction every 2 hours or more often as necessary.
6. Position the newborn on the side or back, with the neck slightly extended.
7. Administer respiratory therapy (percussion and vibration) as prescribed; use padded small plastic cup or small oxygen mask for percussion; use padded electric toothbrush for vibration.
8. Provide nutrition.
9. Support bonding.
10. Prepare parents for short-term to long-term period of oxygen dependency if necessary.
11. Encourage the mother to pump the breasts for future breast-feeding if she so desires.
12. Encourage as much parental participation in the newborn's care as the condition allows.

 Prepare to administer surfactant replacement therapy (instilled into the endotracheal tube) to a newborn with respiratory distress syndrome.

 XI. Meconium Aspiration Syndrome

A. Description

1. Occurs in term or postterm **newborns**

2. Exact etiology is unknown, but the release of meconium into the **amniotic fluid** is thought to be related to a stressful fetal event initiating a biochemical chain of events.

3. Aspiration can occur in utero or with the first breath.

B. Assessment

1. Respiratory distress is present at birth; tachypnea, cyanosis, retractions, nasal flaring, grunting, crackles, and rhonchi may be present.
2. The newborn's nails, skin, and umbilical cord may be stained a yellow-green color.

C. Interventions

1. If the newborn is delivered in an active, crying state with no evidence of respiratory distress, no intervention is necessary.
2. If the newborn is delivered and exhibits inactivity and lack of cry, endotracheal suctioning is performed. If the newborn also exhibits lack of respiratory effort and a low heart rate, additional interventions will occur.
3. Newborns with severe meconium aspiration syndrome may benefit from extracorporeal membrane oxygenation; this therapy uses a modified heart-lung machine and provides oxygen to the circulation, allowing the lungs to rest and decreasing pulmonary hypertension and hypoxemia.

 XII. Bronchopulmonary Dysplasia

A. Description

1. This chronic pulmonary condition affects **newborns** who have experienced respiratory failure or have been oxygen-dependent for more than 28 days.
2. X-ray findings are abnormal, indicating areas of overinflation and atelectasis.

B. Assessment

1. Tachypnea
2. Tachycardia
3. Retractions
4. Nasal flaring
5. Labored breathing
6. Crackles and decreased air movement
7. Occasional expiratory wheezing

C. Interventions

1. Monitor airway and cardiopulmonary function; provide oxygen therapy.
2. Fluid restriction may be prescribed.
3. Medications include **surfactant** at birth, bronchodilators, and possibly diuretics and corticosteroids.

 XIII. Transient Tachypnea of the Newborn

A. Description

1. Respiratory condition that results from incomplete reabsorption of fetal lung fluid in full-term **newborns**
2. Usually disappears within 24 to 48 hours

- B. Assessment
 1. Tachypnea
 2. Expiratory grunting
 3. Retractions
 4. Nasal flaring
 5. Fluid breath sounds per auscultation
 6. Cyanosis
- C. Interventions
 1. Supportive care
 2. Oxygen administration

XIV. Intraventricular Hemorrhage

- A. Description
 1. Bleeding within the ventricles of the brain
 2. Risk factors include prematurity, respiratory distress syndrome, trauma, and asphyxia.
- B. Assessment: Diminished or absent Moro reflex, lethargy, apnea, poor feeding, high-pitched shrill cry, seizure activity
- C. Interventions: Supportive treatment

XV. Retinopathy of Prematurity

- A. Description
 1. Vascular disorder involving gradual replacement of retina by fibrous tissue and blood vessels
 2. Primarily caused by prematurity and use of supplemental oxygen (> 30 days)
- B. Assessment: Leukocoria (white tissue on the retrolental space), vitreous hemorrhage, strabismus, cataracts (check for red reflex)
- C. Interventions: Laser photocoagulation surgery

XVI. Necrotizing Enterocolitis (NEC)

- A. Description
 1. Acute inflammatory disease of the gastrointestinal tract
 2. Usually occurs 4 to 10 days after birth, and is most frequently seen in preterm newborns
- B. Assessment: Increased abdominal girth, decreased or absent bowel sounds, bowel loop distention, vomiting, bile-stained emesis, abdominal tenderness, occult blood in stool
- C. Prevention
 1. Withhold feedings for 24 to 48 hours from infants believed to have suffered birth asphyxia. Breast milk is the preferred nutrient after this time period.
 2. The use of probiotics with enteral feedings and breast milk has shown evidence of prevention of NEC.
 3. Administration of corticosteroids to the mother prior to birth by promoting early gut closure and maturation of the gut mucosa
- D. Interventions
 1. Hold oral feedings.
 2. Insert oral gastric tube to decompress the abdomen.

3. Intravenous antibiotics
4. Intravenous fluids to correct fluid, electrolyte, and acid-base imbalances
5. Surgery if indicated

XVII. Hyperbilirubinemia

- A. Description
 1. Elevated serum bilirubin level
 2. Evaluation is indicated when serum levels are greater than 12 mg/dL (180 μmol/L) in a term newborn.
 3. Therapy is aimed at preventing kernicterus, which results in permanent neurological damage resulting from the deposition of bilirubin in the brain cells.
 - B. Assessment
 1. Jaundice
 2. Elevated serum bilirubin levels
 3. Enlarged liver
 4. Poor muscle tone
 5. Lethargy
 6. Poor sucking reflex
 - C. Interventions
 1. Monitor for the presence of jaundice; assess skin and sclera for jaundice.
 - a. Examine the newborn's skin color in natural light.
 - b. Press a finger over a bony prominence or tip of the newborn's nose to press out capillary blood from the tissues.
 - c. Note that jaundice starts at the head first and spreads to the chest, abdomen, arms and legs, and hands and feet, which are the last to be jaundiced.
 2. Keep the newborn well hydrated to maintain blood volume.
 3. Facilitate early, frequent feeding to hasten passage of meconium and encourage excretion of bilirubin.
 4. Report to the HCP any signs of jaundice in the first 24 hours of life and any abnormal signs and symptoms.
 5. Prepare for phototherapy (bili-light or bili-blanket), and monitor the newborn closely during the treatment.
-  **At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process.**
- D. Phototherapy
 1. Description
 - a. Phototherapy is use of light to reduce serum bilirubin levels in the newborn.
 - b. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur.
 2. Interventions

- a. Expose as much of the newborn's skin as possible.
- b. Cover the genital area, and monitor the genital area for skin irritation or breakdown.
- c. Cover the newborn's eyes with eye shields or patches; ensure that the eyelids are closed when shields or patches are applied.
- d. Remove the shields or patches at least once per shift (during a feeding time) to inspect the eyes for infection or irritation and to allow for eye contact and bonding with the parents.
- e. Measure the lamp energy output to ensure efficacy of the treatment (done with a special device known as a photometer).
- f. Monitor skin temperature closely.
- g. Increase fluids to compensate for water loss.
- h. Expect loose green stools.
- i. Monitor the newborn's skin color with the fluorescent light turned off, every 4 to 8 hours.
- j. Monitor the skin for bronze baby syndrome, a grayish brown discoloration of the skin; notify the HCP because this may indicate a complication of phototherapy.
- k. Reposition the newborn every 2 hours; monitor the newborn closely.
 1. Provide stimulation.
- m. If treatment is done at home, teach the parents about care and indications of the need to notify the HCP.
- n. After treatment, continue monitoring for signs of hyperbilirubinemia, because rebound elevations can occur after therapy is discontinued.
- o. Turn off the phototherapy lights before drawing a blood specimen for serum

bilirubin levels, and do not leave the blood specimen uncovered under fluorescent lights (to prevent the breakdown of bilirubin in the blood specimen).

XVIII. Erythroblastosis Fetalis

A. Description

1. Erythroblastosis fetalis is the destruction of red blood cells that results from an antigen-antibody reaction.
2. The disorder is characterized by hemolytic anemia or hyperbilirubinemia.
3. Exchange of fetal and maternal blood occurs primarily when the placenta separates at birth (Fig. 31-5).
4. Antibodies are harmless to the mother, but attach to the erythrocytes in the fetus and cause hemolysis.
5. Sensitization is rare with the first pregnancy.
6. ABO incompatibility is usually less severe.

B. Assessment

1. Anemia
2. Jaundice that develops rapidly after birth and before 24 hours
3. Edema

C. Interventions

1. Administer Rh_o(D) immune globulin to the mother during the first 72 hours after birth if the Rh-negative mother delivers an Rh-positive fetus but remains unsensitized.
2. Assist with exchange transfusion after birth or intrauterine transfusion as prescribed.
3. The newborn's blood is replaced with Rh-negative blood to stop the destruction of the newborn's red blood cells; the Rh-negative blood is replaced with the newborn's own blood gradually.
4. Provide support to the parents.

FIGURE 31-5 Development of maternal sensitization to Rh antigens. A, Fetal Rh-positive erythrocytes enter the maternal system. Maternal anti-Rh antibodies are formed. B, Anti-Rh antibodies cross the placenta and attack fetal erythrocytes.

XIX. Sepsis

- A. Description: Generalized infection resulting from the presence of bacteria in the blood, such as Group B streptococcal infection
- B. Assessment
1. Pallor
 2. Tachypnea, tachycardia
 3. Poor feeding
 4. Abdominal distention
 5. Temperature instability
- C. Interventions
1. Assess for periods of apnea or irregular respirations.
 2. If apnea is present, stimulate by gently rubbing the chest or foot.
 3. Administer oxygen as prescribed.
 4. Monitor vital signs; assess for fever.
 5. Maintain warmth in a radiant warmer.
 6. Provide isolation as necessary.
 7. Monitor intake and output, and obtain daily weight.
 8. Monitor for diarrhea.
 9. Assess feeding and sucking reflex, which may be poor.
 10. Assess for jaundice.
 11. Assess for irritability and lethargy.
 12. Administer antibiotics as prescribed, and observe carefully for toxicity because a newborn's liver and kidneys are immature.

XX. TORCH Infections (see Chapter 26)**XXI. Syphilis**

- A. Description
1. Syphilis is a sexually transmitted infection.
 2. Congenital syphilis can result in premature birth, skin lesions, and abnormal skeletal development.
 3. The causative organism, *Treponema pallidum*, a spirochete, is able to cross the **placenta** throughout pregnancy and infect the fetus, usually after 18 weeks' gestation.
 4. Risks include preterm birth, stillbirth, and low birth weight.
 5. Congenital effects are irreversible and may include central nervous system damage and hearing loss.
- B. Assessment
1. Hepatosplenomegaly
 2. Joint swelling
 3. Palmar rash and lesions (Fig. 31-6)
 4. Anemia
 5. Jaundice
 6. Snuffles
 7. Ascites
 8. Pneumonitis
 9. Cerebrospinal fluid changes

C. Interventions

1. Monitor the newborn for signs of syphilis.
2. Prepare the newborn for serological testing if prescribed.
3. Administer antibiotic therapy as prescribed.
4. Use standard precautions and drainage and secretion (contact) precautions with suspected congenital syphilis.
5. Wear gloves when handling the newborn until antibiotic therapy has been administered for 24 hours.
6. Provide psychological support to the mother, and provide instructions regarding follow-up care to the newborn.

XXII. Addicted Newborn**A. Description**

1. A newborn can become passively addicted to drugs that have passed through the **placenta**.
2. Assessment findings and withdrawal times may vary depending on the specific addicting drug.
3. See also Fetal Alcohol Spectrum Disorders (FASDs) below.

B. Assessment

1. Irritability
2. Tremors
3. Hyperactivity and hypertonicity
4. Respiratory distress
5. Vomiting
6. High-pitched cry
7. Sneezing
8. Fever
9. Diarrhea
10. Excessive sweating
11. Poor feeding
12. Extreme sucking of fists
13. Seizures

FIGURE 31-6 Neonatal syphilitic lesions on hands and feet. (From Lowdermilk et al., 2012. Courtesy Mahesh Kotwal, MD, Phoenix, Arizona.)

C. Interventions

1. Monitor respiratory and cardiac status frequently.
2. Monitor temperature and vital signs.
3. Hold newborn firmly and close to the body during feeding and when giving care.
4. Initiate seizure precautions (pad sides of the crib).
5. Provide small frequent feedings and allow a longer period for feeding.
6. Monitor intake and output.
7. Administer intravenous hydration if prescribed.
8. Protect the newborn's skin from injury that can be caused by the constant rubbing from hyperactive jitters.
9. Swaddle the newborn.
10. Place the newborn in a quiet room and reduce stimulation.
11. Allow the mother to express feelings such as anxiety and guilt.
12. Refer the mother for treatment of the substance abuse problem.

XXIII. Fetal Alcohol Spectrum Disorders (FASDs)

A. Description

1. FASDs are a group of conditions caused by maternal alcohol use during pregnancy.
2. The disorders are a result of teratogenesis.
3. FASDs cause cognitive and physical delays.
4. Fetal alcohol syndrome is the most severe of the FASDs. The other disorders included in this category are alcohol-related neurodevelopmental disorder (ARND) and alcohol-related birth defects (ARBDs).

B. Assessment

1. Facial changes (Fig. 31-7)
 - a. Short palpebral fissures
 - b. Hypoplastic philtrum
 - c. Short, upturned nose
 - d. Flat midface
 - e. Thin upper lip
 - f. Low nasal bridge
2. Abnormal palmar creases
3. Respiratory distress (apnea, cyanosis)
4. Congenital heart disorders
5. Irritability and hypersensitivity to stimuli
6. Tremors
7. Poor feeding
8. Seizures

C. Interventions

1. Monitor for respiratory distress.
2. Position the newborn on the side to facilitate drainage of secretions.
3. Keep resuscitation equipment at the bedside.
4. Monitor for hypoglycemia.
5. Assess suck and swallow reflex.
6. Administer small feedings and burp well.
7. Suction as necessary.

8. Monitor intake and output.

9. Monitor weight and head circumference.

10. Decrease environmental stimuli.

11. Make referral to local early intervention system.

XXIV. Newborn of a Mother with Human Immunodeficiency Virus (HIV)

A. Description

1. The fetus of a mother who is positive for HIV antibody should be monitored closely throughout the pregnancy.
2. Serial ultrasound screenings should be done during pregnancy to identify IUGR.
3. Weekly nonstress testing after 32 weeks of gestation and biophysical profiles may be necessary during pregnancy.
4. Newborns born to HIV-positive mothers may test positive because the mother's antibodies may persist in the newborn for 18 months after birth.
5. The use of antiviral medication, the reduction of newborn exposure to maternal blood and body fluids, and the early identification of HIV in pregnancy reduce the risk of transmission to the newborn.
6. All newborns born to HIV-positive mothers acquire maternal antibody to HIV infection, but not all acquire the infection.
7. The newborn may be asymptomatic for the first several months to years of life.

B. Transmission

1. Across placental barrier
2. During labor and birth

FIGURE 31-7 Infant with fetal alcohol syndrome. (From Markiewicz, Abrahamson, 1999.)

3. Breast milk (breast-feeding not done if the mother is HIV-positive)

C. Assessment

1. Possibly no outward signs at birth
2. Signs of immunodeficiency
3. Hepatomegaly
4. Splenomegaly
5. Lymphadenopathy
6. Impairment in growth and development

D. Interventions

1. Clean the newborn's skin carefully before any invasive procedure, such as the administration of phytonadione, heel sticks, or venipunctures.
2. Circumcisions are not done on newborns with HIV-positive mothers until the newborn's status is determined.
3. Newborn can room with mother.
4. All HIV-exposed newborns should be treated with medication to prevent infection by *Pneumocystis jiroveci*.
5. Antiretroviral medications may be administered as prescribed for the first 6 weeks of life or longer if prescribed.
6. Monitor for early signs of immunodeficiency, such as enlarged spleen or liver, lymphadenopathy, and impairment in growth and development.
7. Newborns at risk for HIV infection should be seen by the HCP at birth and at 1 week, 2 weeks, 1 month, and 2 months of age.
8. Inform the mother that HIV culture is recommended at 1 month and after 4 months of age.

E. Immunizations

1. Immunizations with live vaccines, such as measles-mumps-rubella and varicella, should not be done until the newborn's, infant's, or child's status is confirmed.
2. If infected, live vaccine will not be given.

 **Newborns at risk for HIV infection need to receive all recommended immunizations at the regular schedule; live vaccines are not administered until HIV status is determined.**

XXV. Newborn of a Diabetic Mother

A. Description

1. Infant born to mother with type 1 or type 2 diabetes or gestational diabetes
2. Hypoglycemia, hyperbilirubinemia, respiratory distress syndrome, hypocalcemia, birth trauma, and congenital anomalies may be present.

B. Assessment

1. Excessive size and weight as a result of excess fat and glycogen in the tissues
2. Edema or puffiness in the face and cheeks
3. Signs of hypoglycemia, such as twitching, apnea, difficulty in feeding, lethargy, seizures, and cyanosis

4. Hyperbilirubinemia
5. Signs of respiratory distress, such as tachypnea, cyanosis, retractions, grunting, and nasal flaring

C. Interventions

1. Monitor for signs of respiratory distress, birth trauma, and congenital anomalies.
2. Monitor bilirubin and blood glucose levels.
3. Monitor weight.
4. Feed the newborn soon after birth with glucose in water, breast milk, or formula as prescribed.
5. Administer glucose intravenously to treat hypoglycemia if necessary and as prescribed.
6. Monitor for edema.
7. Monitor for respiratory distress, tremors, or seizures.

XXVI. Hypoglycemia

A. Description

1. Hypoglycemia is an abnormally low level of glucose in the blood (<40 mg/dL [<2.3 mmol/L] in the first 72 hours of life or <45 mg/dL [<2.6 mmol/L] after the first 3 days of life).
2. Normal blood glucose reference interval is 40 to 60 mg/dL (2.3 to 3.4 mmol/L) in a 1-day-old newborn and 50 to 90 mg/dL (2.9 to 5.1 mmol/L) in a newborn older than 1 day (institutional values for normal newborn blood glucose levels vary).

B. Assessment

1. Increased respiratory rate
2. Twitching, nervousness, or tremors
3. Unstable temperature
4. Lethargy, apnea, seizures, cyanosis

C. Interventions

1. Prevent low blood glucose level through early feedings.
2. Administer formula orally or glucose intravenously as prescribed.
3. Monitor blood glucose levels as prescribed.
4. Monitor for feeding problems.
5. Monitor for apneic periods.
6. Assess for shrill or intermittent cries.
7. Evaluate lethargy and poor muscle tone.

XXVII. Hypothyroidism

A. Description: Hypothyroidism is a decrease in the production of thyroid hormone.

B. Assessment

1. Protruding or thick tongue
2. Dull look
3. Swollen face
4. Decreased muscle tone

C. Interventions: Focus on thyroid replacement

XXVIII. Relief of Choking in an Infant

A. Description: Choking is also known as foreign body airway obstruction (FBAO).

B. Assessment

1. Signs of mild airway obstruction include good air exchange, ability to cough forcefully, and wheezing between coughs.
2. Signs of severe airway obstruction include poor or no air exchange, weak or ineffective cough or no cough, a high-pitched noise while inhaling or no noise, increased respiratory difficulty, cyanosis, and inability to cry.

C. Interventions

1. For mild obstruction, do not interfere with the infant's own attempts to expel the object. Stay with them and continue to monitor. If the obstruction persists, activate the emergency response system and relieve the obstruction.
2. Severe obstruction must be relieved as soon as possible (see [Priority Nursing Actions](#)).

XXIX. Cardiopulmonary Resuscitation (CPR) Guidelines for Infants

A. Description: Infants include individuals who are 1 year of age or less. The basic life support (BLS) sequence for infants is very similar to that used for child and adult CPR. The main differences include the following:

1. Location of the pulse check is the brachial artery in infants.
2. Compression technique is to use 2 fingers for a single rescuer and to use a 2 thumb-encircling technique for 2 rescuers.
3. Compression depth should be one third of the chest depth, which is approximately 1½ inches or 4 cm.
4. The compression to ventilation ratio for 1 rescuer is 30:2; 2 rescuers is 15:2.

⚡ PRIORITY NURSING ACTIONS

Choking Infant

1. Sit or kneel with the infant in your lap.
2. Remove clothing from the infant's chest if easily removed.
3. Hold the infant face down with the head lower than the chest while resting on your forearm. The infant's head and jaw should be supported with the hand. The forearm is rested on the thigh to support the infant ([Fig. 31-8](#)).

FIGURE 31-8 Relief of choking in the newborn infant.

4. Deliver 5 back slaps between the infant's shoulder blades using the heel of the other hand with sufficient force. Place free hand on infant's back while supporting the back of the infant's head with the palm of the hand. Cradle the infant between the 2 forearms. Turn the infant as a unit while supporting the head and neck.
5. Rest the forearm on the thigh while holding the infant face up. Deliver 5 chest thrusts in the middle of the chest over the lower half of the sternum at a rate of 1 per second with enough force to dislodge the foreign body.
6. Repeat the sequence until the object is removed or the infant becomes unresponsive.

7. If the infant becomes unresponsive, call for help and activate the emergency response system.
8. Begin cardiopulmonary resuscitation (CPR) while checking for a foreign body each time the airway is opened. Do not perform blind finger sweeps.

The interventions to relieve choking in an infant are different than the interventions for an adult. First, the rescuer sits or kneels with the infant in the lap and removes the clothing if it is easy to do so. Next, the infant is held face down with the head lower than the chest on the rescuer's forearm. The rescuer must remember to support the head and jaw throughout this process, and rests the forearm on the thigh (see [Fig. 31-8](#)). The rescuer delivers up to 5 back slaps forcefully between the infant's shoulder blades using the heel of the hand with sufficient force to dislodge the foreign body. Next, the rescuer's free hand is placed on the infant's back and cradles the infant between their 2 forearms while supporting the infant's head and neck. The infant is turned as a unit and the head is kept lower than the trunk. The rescuer delivers up to 5 chest thrusts in the middle of the chest over the lower half of the sternum at a rate of 1 per second with enough force to dislodge the foreign body. This sequence is repeated until the object is removed or the infant becomes unresponsive. If the infant becomes unresponsive, the rescuer should call for help and ask someone to activate the emergency response system. CPR is started and each time the airway is opened, the rescuer checks for a foreign body. Blind finger sweeps are not performed because this may push the foreign body further back into the airway. If the emergency response system could not be activated by another person, the single rescuer would activate it after 2 minutes of CPR.

Reference

American Heart Association (2011), pp. 55–56.
Hockenberry, Wilson (2015), pp. 1200–1202.

5. The emergency response system should be activated if the arrest is not witnessed and the rescuer is alone after providing 2 minutes of CPR; after 2 minutes the single rescuer can activate the emergency response system and get an automated external defibrillator.
 6. The emergency response system should be activated and the automated external defibrillator should be retrieved before beginning CPR if the arrest is sudden and witnessed.
- B. Refer to [Chapter 56](#) for detailed information on the American Heart Association's recommendations for the CPR sequence.
3. Set up the intravenous line with 5% dextrose in water.
 4. Set the radiant warmer control temperature at 36.5 °C (97.6 °F).
322. The nurse is assessing a newborn after circumcision and notes that the circumcised area is red with a small amount of bloody drainage. Which nursing action is most appropriate?
1. Apply gentle pressure.
 2. Reinforce the dressing.
 3. Document the findings.
 4. Contact the health care provider (HCP).

CRITICAL THINKING What Should You Do?

Answer: Slight tremors noted in the newborn may be a common finding, but could also be a sign of hypoglycemia, hypocalcemia, or drug withdrawal. The nurse should determine the presence of tremors so that treatment can be initiated immediately. This finding should also be reported to the health care provider immediately.

Reference: Hockenberry, Wilson (2015), p. 393.

PRACTICE QUESTIONS

319. The nurse assisted with the birth of a newborn. Which nursing action is most effective in preventing heat loss by evaporation?
1. Warming the crib pad
 2. Closing the doors to the room
 3. Drying the infant with a warm blanket
 4. Turning on the overhead radiant warmer
320. The mother of a newborn calls the clinic and reports that when cleaning the umbilical cord, she noticed that the cord was moist and that discharge was present. What is the most appropriate nursing instruction for this mother?
1. Bring the infant to the clinic.
 2. This is a normal occurrence and no further action is needed.
 3. Increase the number of times that the cord is cleaned per day.
 4. Monitor the cord for another 24 to 48 hours and call the clinic if the discharge continues.
321. The nurse in a neonatal intensive care unit (NICU) receives a telephone call to prepare for the admission of a 43-week gestation newborn with Apgar scores of 1 and 4. In planning for admission of this newborn, what is the nurse's highest priority?
1. Turn on the apnea and cardiorespiratory monitors.
 2. Connect the resuscitation bag to the oxygen outlet.
 3. Set up the intravenous line with 5% dextrose in water.
 4. Set the radiant warmer control temperature at 36.5 °C (97.6 °F).
322. The nurse is assessing a newborn after circumcision and notes that the circumcised area is red with a small amount of bloody drainage. Which nursing action is most appropriate?
1. Apply gentle pressure.
 2. Reinforce the dressing.
 3. Document the findings.
 4. Contact the health care provider (HCP).
323. The nurse in a newborn nursery is monitoring a preterm newborn for respiratory distress syndrome. Which assessment findings should alert the nurse to the possibility of this syndrome? Select all that apply.
- 1. Cyanosis
 - 2. Tachypnea
 - 3. Hypotension
 - 4. Retractions
 - 5. Audible grunts
 - 6. Presence of a barrel chest
324. The postpartum nurse is providing instructions to the mother of a newborn with hyperbilirubinemia who is being breast-fed. The nurse should provide which instruction to the mother?
1. Feed the newborn less frequently.
 2. Continue to breast-feed every 2 to 4 hours.
 3. Switch to bottle-feeding the infant for 2 weeks.
 4. Stop breast-feeding and switch to bottle-feeding permanently.
325. The nurse is assessing a newborn who was born to a mother who is addicted to drugs. Which findings should the nurse expect to note during the assessment of this newborn? Select all that apply.
- 1. Lethargy
 - 2. Sleepiness
 - 3. Irritability
 - 4. Constant crying
 - 5. Difficult to comfort
 - 6. Cuddles when being held
326. The nurse notes hypotonia, irritability, and a poor sucking reflex in a full-term newborn on admission to the nursery. The nurse suspects fetal alcohol syndrome and is aware that which additional sign would be consistent with this syndrome?
1. Length of 19 inches
 2. Abnormal palmar creases
 3. Birth weight of 6 lb, 14 oz (3120 g)
 4. Head circumference appropriate for gestational age

327. The nurse is creating a plan of care for a newborn diagnosed with fetal alcohol syndrome. The nurse should include which priority intervention in the plan of care?
1. Allow the newborn to establish own sleep-rest pattern.
 2. Maintain the newborn in a brightly lighted area of the nursery.
 3. Encourage frequent handling of the newborn by staff and parents.
 4. Monitor the newborn's response to feedings and weight gain pattern.
328. The nurse administers erythromycin ointment (0.5%) to the eyes of a newborn and the mother asks the nurse why this is performed. Which explanation is best for the nurse to provide about neonatal eye prophylaxis?
1. Protects the newborn's eyes from possible infections acquired while hospitalized.
 2. Prevents cataracts in the newborn born to a woman who is susceptible to rubella.
 3. Minimizes the spread of microorganisms to the newborn from invasive procedures during labor.
 4. Prevents an infection called ophthalmia neonatorum from occurring after birth in a newborn born to a woman with an untreated gonococcal infection.
- ❖ 329. The nurse is preparing to care for a newborn receiving phototherapy. Which interventions should be included in the plan of care? Select all that apply.
- 1. Avoid stimulation.
 - 2. Decrease fluid intake.
 - 3. Expose all of the newborn's skin.
 - 4. Monitor skin temperature closely.
 - 5. Reposition the newborn every 2 hours.
 - 6. Cover the newborn's eyes with eye shields or patches.
330. The nurse creates a plan of care for a woman with human immunodeficiency virus (HIV) infection and her newborn. The nurse should include which intervention in the plan of care?
1. Monitoring the newborn's vital signs routinely
 2. Maintaining standard precautions at all times while caring for the newborn
 3. Initiating referral to evaluate for blindness, deafness, learning problems, or behavioral problems
 4. Instructing the breast-feeding mother regarding the treatment of the nipples with nystatin ointment
331. The nurse is planning care for a newborn of a mother with diabetes mellitus. What is the priority nursing consideration for this newborn?
1. Developmental delays because of excessive size
 2. Maintaining safety because of low blood glucose levels
 3. Choking because of impaired suck and swallow reflexes
 4. Elevated body temperature because of excess fat and glycogen
332. Which statement reflects a new mother's understanding of the teaching about the prevention of newborn abduction?
1. "I will place my baby's crib close to the door."
 2. "Some health care personnel won't have name badges."
 3. "I will ask the nurse to attend to my infant if I am napping and my husband is not here."
 4. "It's okay to allow the nurse assistant to carry my newborn to the nursery."
333. The nurse prepares to administer a phytonadione (vitamin K) injection to a newborn, and the mother asks the nurse why her infant needs the injection. What best response should the nurse provide?
1. "Your newborn needs the medicine to develop immunity."
 2. "The medicine will protect your newborn from being jaundiced."
 3. "Newborns have sterile bowels, and the medicine promotes the growth of bacteria in the bowel."
 4. "Newborns are deficient in vitamin K, and this injection prevents your newborn from bleeding."

ANSWERS

319. 3

Rationale: Evaporation of moisture from a wet body dissipates heat along with the moisture. Keeping the newborn dry by drying the wet newborn at birth prevents hypothermia via evaporation. Hypothermia caused by conduction occurs when the newborn is on a cold surface, such as a cold pad or mattress,

and heat from the newborn's body is transferred to the colder object (direct contact). Warming the crib pad assists in preventing hypothermia by conduction. Convection occurs as air moves across the newborn's skin from an open door and heat is transferred to the air. Radiation occurs when heat from the newborn radiates to a colder surface (indirect contact).

Test-Taking Strategy: Note the **strategic words**, most effective. Recalling that evaporation of moisture from a wet body

dissipates heat along with the moisture will assist in directing you to the correct option.

Review: Methods of **heat loss** in a newborn

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Newborn

Priority Concepts: Caregiving; Thermoregulation

Reference: Hockenberry, Wilson (2015), p. 267.

320. 1

Rationale: Signs of umbilical cord infection are moistness, oozing, discharge, and a reddened base around the cord. If signs of infection occur, the client should be instructed to notify a health care provider (HCP). If these symptoms occur, antibiotics may be necessary. Options 2, 3, and 4 are not the most appropriate nursing interventions for an umbilical cord infection as given in the question.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the clinical manifestations provided in the question to assist in answering. Noting the word discharge in the question will assist in directing you to the option that indicates that the newborn needs to be seen by the HCP.

Review: Interventions related to **cord care**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Maternity—Newborn

Priority Concepts: Clinical Judgment; Infection

Reference: Hockenberry, Wilson (2015), pp. 271-272.

321. 2

Rationale: The highest priority on admission to the nursery for a newborn with a low Apgar score is the airway, which would involve preparing respiratory resuscitation equipment and oxygen. The remaining options are also important, although they are of lower priority. The newborn would be placed on an apnea and cardiorespiratory monitor. Setting up an intravenous line with 5% dextrose in water would provide circulatory support. The radiant warmer would provide an external heat source, which is necessary to prevent further respiratory distress.

Test-Taking Strategy: Note the **strategic words**, highest priority. This question asks you to prioritize care on the basis of information about a newborn's condition. Use the **ABCs—airway—breathing—circulation**. A method of planning for airway support is to have the resuscitation bag connected to an oxygen source.

Review: Care of the newborn with low **Apgar scores**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Critical Care: Emergency Situations/Management

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Hockenberry, Wilson (2015), p. 247.

322. 3

Rationale: The penis is normally red during the healing process after circumcision. A yellow exudate may be noted in 24 hours, and this is part of normal healing. The nurse would expect that the area would be red with a small amount of

bloody drainage. Only if the bleeding were excessive would the nurse apply gentle pressure with a sterile gauze. If bleeding cannot be controlled, the blood vessel may need to be ligated, and the nurse would notify the HCP. Because the findings identified in the question are normal, the nurse would document the assessment findings.

Test-Taking Strategy: Note the **strategic words**, most appropriate, and focus on the assessment findings in the question. This should assist in directing you to the correct option, because this is a normal occurrence after circumcision.

Review: Expected findings after **circumcision**

Level of Cognitive Ability: Applying

Priority Concepts: Clinical Judgment; Development

Reference: Hockenberry, Wilson (2015), p. 274.

❖ 323. 1, 2, 4, 5

Rationale: A newborn infant with respiratory distress syndrome may present with clinical signs of cyanosis, tachypnea or apnea, nasal flaring, chest wall retractions, or audible grunts. Hypotension and a barrel chest are not clinical manifestations associated with respiratory distress syndrome.

Test-Taking Strategy: Focus on the **subject**, signs of respiratory distress syndrome. Eliminate hypotension, as this is not a finding associated with respiratory distress syndrome. Also, respiratory distress syndrome is an acute occurrence and a barrel chest develops with a chronic condition. In addition, note the relationship between the diagnosis and the signs noted in the correct options.

Review: Signs of **respiratory distress syndrome**

324. 2

Rationale: Hyperbilirubinemia is an elevated serum bilirubin level. At any serum bilirubin level, the appearance of jaundice during the first day of life indicates a pathological process. Early and frequent feeding hastens the excretion of bilirubin. Breast-feeding should be initiated within 2 hours after birth and every 2 to 4 hours thereafter. The infant should not be fed less frequently. Switching to bottle-feeding for 2 weeks or stopping breast-feeding permanently is unnecessary.

Test-Taking Strategy: Eliminate options 3 and 4 are **comparable or alike**. These options discourage the continuation of breast-feeding and should be eliminated. From the remaining options, recalling the pathophysiology associated with hyperbilirubinemia will assist you in eliminating option 1.

Review: **Hyperbilirubinemia** in the newborn

❖ 325. 3, 4, 5

Rationale: A newborn of a woman who uses drugs is irritable. The infant is overloaded easily by sensory stimulation. The infant may cry incessantly and be difficult to console. The infant would hyperextend and posture rather than cuddle when being held. This infant is not lethargic or sleepy.

Test-Taking Strategy: Lethargy and sleepiness are **comparable or alike** in that they indicate hypoactivity of the newborn, and therefore can be eliminated. From the remaining options, recalling the pathophysiology associated with an infant born to a drug-addicted mother and that the newborn is irritable will assist you in eliminating that this infant will be easily comforted and cuddle when held.

Review: Assessment findings for the **newborn of a drug-addicted mother**

Priority Concepts: Addiction; Clinical Judgment

Reference: Hockenberry, Wilson (2015), p. 396.

326. 2

Rationale: Fetal alcohol syndrome, a diagnostic category of fetal alcohol spectrum disorders (FASDs), is caused by maternal alcohol use during pregnancy. Features of newborns diagnosed with fetal alcohol syndrome include craniofacial abnormalities, intrauterine growth restriction, cardiac abnormalities, abnormal palmar creases, and respiratory distress. Options 1, 3, and 4 are normal assessment findings in the full-term newborn infant. Test-Taking Strategy: Use knowledge regarding normal assessment findings in the full-term newborn infant to answer this question. Length, birth weight, and head circumference are **comparable or alike** in that all are physical measurements assessed on a newborn and represent normal findings in a full-term newborn.

Review: Normal newborn assessment findings and **fetal alcohol syndrome**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Reference: Hockenberry, Wilson (2015), p. 401.

327. 4

Rationale: Fetal alcohol syndrome, a diagnostic category delineated under fetal alcohol spectrum disorders (FASDs), is caused by maternal alcohol use during pregnancy. A primary nursing goal for the newborn diagnosed with fetal alcohol syndrome is to establish nutritional balance after birth. These newborns may exhibit hyperirritability, vomiting, diarrhea, or an uncoordinated sucking and swallowing ability. A quiet environment with minimal stimuli and handling would help to establish appropriate sleep-rest cycles in the newborn as well. Options 1, 2, and 3 are inappropriate interventions.

Test-Taking Strategy: Note the **strategic word**, priority. Think about the pathophysiology that occurs in a newborn with this condition. Also, use **Maslow's Hierarchy of Needs theory** to direct you to the correct option. Remember that nutrition is a priority.

Priority Concepts: Addiction; Clinical Judgment

Reference: Hockenberry, Wilson (2015), p. 401.

328. 4

Rationale: Erythromycin ophthalmic ointment 0.5% is used as a prophylactic treatment for ophthalmia neonatorum, which is caused by the bacterium *Neisseria gonorrhoeae*. Preventive treatment of gonorrhea is required by law. Options 1, 2, and 3 are not the purposes for administering this medication to a newborn infant.

Test-Taking Strategy: Note the **strategic word**, best. Use knowledge of the purpose of administering erythromycin ophthalmic ointment to a newborn infant. Remember that this is done to prevent ophthalmia neonatorum.

Priority Concepts: Health Promotion; Infection

Reference: Hockenberry, Wilson (2015), p. 268.

❖ 329. 4, 5, 6

Rationale: Phototherapy (bili-light or bili-blanket), is the use of intense fluorescent light to reduce serum bilirubin levels in the newborn. Adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur. Interventions include exposing as much of the newborn's skin as possible; however, the genital area is covered. The newborn's eyes are also covered with eye shields or patches, ensuring that the eyelids are closed when shields or patches are applied. The shields or patches are removed at least once per shift to inspect the eyes for infection or irritation and to allow eye contact. The nurse measures the lamp energy output to ensure efficacy of the treatment (done with a special device known as a photometer), monitors skin temperature closely, and increases fluids to compensate for water loss. The newborn may have loose green stools and green-colored urine. The newborn's skin color is monitored with the fluorescent light turned off every 4 to 8 hours and is monitored for bronze baby syndrome, a grayish brown discoloration of the skin. The newborn is repositioned every 2 hours, and stimulation is provided. After treatment, the newborn is monitored for signs of hyperbilirubinemia because rebound elevations can occur after therapy is discontinued.

Test-Taking Strategy: Focus on the **subject**, phototherapy. Recalling that adverse effects from treatment, such as eye damage, dehydration, or sensory deprivation, can occur will assist in determining the correct interventions.

Review: Interventions for the newborn receiving **phototherapy**

Level of Cognitive Ability: Analyzing

Priority Concepts: Cellular Regulation; Safety

Reference: Hockenberry, Wilson (2015), p. 320.

330. 2

Rationale: An infant born to a mother infected with HIV must be cared for with strict attention to standard precautions. This prevents the transmission of HIV from the newborn, if infected, to others and prevents transmission of other infectious agents to the possibly immunocompromised newborn. Options 1 and 3 are not associated specifically with the care of a potentially HIV-infected newborn. Mothers infected with HIV should not breast-feed.

Test-Taking Strategy: Eliminate options 1 and 3 first because they are **comparable or alike** and are not associated specifically with the care of a potentially HIV-infected newborn. Recalling that HIV-infected mothers should not breast-feed will direct you to the correct option.

Review: Care of an infant born to a **human immunodeficiency virus (HIV)**-infected mother

Priority Concepts: Infection; Safety

Reference: Hockenberry, Wilson (2015), pp. 193-194.

331. 2

Rationale: The newborn of a diabetic mother is at risk for hypoglycemia, so maintaining safety because of low blood glucose levels would be a priority. The newborn would also be at risk for hyperbilirubinemia, respiratory distress, hypocalcemia, and congenital anomalies. Developmental delays, choking, and an elevated body temperature are not expected problems. Test-Taking Strategy: Note the **strategic word**, priority. Read each option thoroughly and eliminate options 1, 3, and 4 because they are **comparable or alike** in that newborns of diabetic mothers are not at risk for these problems. Also, note the relationship of the words diabetes mellitus in the question and the word glucose in the correct option.

Review: Nursing interventions for **newborns of diabetic mothers**

Level of Cognitive Ability: Analyzing

Content Area: Maternity—Newborn

Priority Concepts: Clinical Judgment; Glucose Regulation

Reference: Hockenberry, Wilson (2015), p. 328.

332. 3

Rationale: Precautions to prevent infant abduction include placing a newborn's crib away from the door, transporting a

newborn only in the crib and never carrying the newborn, expecting health care personnel to wear identification that is easily visible at all times, and asking the nurse to attend to the newborn if the mother is napping and no family member is available to watch the newborn (the newborn is never left unattended). If the mother states that she will ask the nurse to watch the newborn while she is sleeping, she has understood the teaching. Options 1, 2, and 4 are incorrect and indicate that the mother needs further teaching.

Test-Taking Strategy: Focus on the **subject**, that the client understands precautions to prevent infant abduction. Read each option carefully and select the option that provides protection to the infant. This will direct you to the correct option.

Review: Precautions to prevent **newborn abduction**

Reference: Hockenberry, Wilson (2015), p. 268.

333. 4

Rationale: Phytonadione is necessary for the body to synthesize coagulation factors. It is administered to the newborn to prevent bleeding disorders. It also promotes liver formation of the clotting factors II, VII, IX, and X. Newborns are vitamin K-deficient because the bowel does not have the bacteria necessary to synthesize fat-soluble vitamin K. The normal flora in the intestinal tract produces vitamin K. The newborn's bowel does not support the normal production of vitamin K until bacteria adequately colonize it. The bowel becomes colonized by bacteria as food is ingested. Vitamin K does not promote the development of immunity or prevent the infant from becoming jaundiced.

Test-Taking Strategy: Note the **strategic word**, best. Because immunity and jaundice are not related to the action of vitamin K, eliminate options 1 and 2. From the remaining options, recall the action of vitamin K to direct you to the correct option. Remember that vitamin K does not promote the growth of bacteria, but is administered to prevent bleeding.

Maternity and Newborn Medications

PRIORITY CONCEPTS Health Promotion, Safety

CRITICAL THINKING What Should You Do?

The nurse notes that a pregnant client who has undergone amniocentesis is Rh-negative. What should the nurse do? Answer located on p. 399.

I. Tocolytics

- A. Description: Tocolytics are medications that produce uterine relaxation and suppress uterine activity (Table 32-1).
- B. Uses: To halt uterine contractions and prevent preterm birth; dihydropyridine calcium channel blockers such as nifedipine and magnesium sulfate may be prescribed to achieve this goal.
- C. Adverse effects and contraindications
 1. See Table 32-1 for a description of adverse effects.
 2. Maternal contraindications include severe preeclampsia and eclampsia, active vaginal bleeding, intrauterine infection, cardiac disease, and medical or obstetric conditions that contraindicate continuation of pregnancy.
 3. Fetal contraindications include estimated gestational age greater than 37 weeks, cervical dilation greater than 4 cm, fetal demise, lethal fetal anomaly, chorioamnionitis, acute fetal distress, and chronic intrauterine growth restriction.
- D. Interventions for the client receiving tocolytic therapy
 1. Position the client on her side to enhance placental perfusion and reduce pressure on the cervix.
 2. Monitor maternal vital signs, fetal status, and labor status frequently according to agency protocol.
 3. Monitor for signs of adverse effects to the medication.
 4. Monitor daily weight and input and output status, and provide fluid intake as prescribed.
 5. Offer comfort measures and provide psychosocial support to the client and family.

6. See Table 32-1 for interventions specific to each tocolytic medication.

II. Magnesium Sulfate

- A. Description (see Table 32-1)
 1. Magnesium sulfate is a central nervous system depressant and antiseizure medication.
 2. The medication causes smooth muscle relaxation.
 3. The antidote is calcium gluconate.
- B. Uses
 1. Stopping preterm labor to prevent preterm birth
 2. Preventing and controlling seizures in preeclamptic and eclamptic clients
- C. Adverse effects and contraindications
 1. Magnesium sulfate can cause respiratory depression, depressed reflexes, flushing, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.
 2. Continuous intravenous (IV) infusion increases the risk of magnesium toxicity in the newborn.
 3. IV administration should not be used for 2 hours preceding birth.
 4. Magnesium sulfate may be prescribed for the first 12 to 24 hours postpartum if it is used for preeclampsia.
 5. High doses can cause loss of deep tendon reflexes, heart block, respiratory paralysis, and cardiac arrest.
 6. The medication is contraindicated in clients with heart block, myocardial damage, or kidney failure.
 7. The medication is used with caution in clients with kidney impairment.
- D. Interventions
 1. Monitor maternal vital signs, especially respirations, every 30 to 60 minutes.
 2. Assess renal function and electrocardiogram for cardiac function.
 3. Monitor magnesium levels—the target range when used as a tocolytic agent is 4 to 7.5 mEq/L (2 to 3.75 mmol/L); if the magnesium level increases, notify the health care provider (HCP).

TABLE 32-1 Tocolytics

Medication, Classification, and Actions	Adverse Effects	Nursing Interventions
Magnesium sulfate—central nervous system depressant; relaxes smooth muscle, including the uterus; used to halt preterm labor contractions; used for preeclamptic clients to prevent seizures	Maternal—depressed respirations, depressed DTRs, hypotension, extreme muscle weakness, flushing, decreased urine output, pulmonary edema, serum magnesium levels > 7.5 mEq/L (3.75 mmol/L)	Always use intravenous controller device for administration
	Newborn—hypotonia and sleepiness	Follow agency protocol for administration
		Discontinue infusion and notify HCP if adverse effects occur
		Monitor for respirations < 12/min, urine output < 100 mL/4 hr (25-30 mL/hr)
		Monitor DTRs
		Monitor magnesium levels and report values outside therapeutic range of 4 to 7.5 mEq/L (2 to 3.75 mmol/L)
Nifedipine—calcium channel blocker; relaxes smooth muscles, including the uterus, by blocking calcium entry; in some health care agencies, this may be the first-line agent to halt preterm labor contractions	Maternal—tachycardia, hypotension, dizziness, headache, nervousness, facial flushing, fatigue, nausea	Follow agency protocol for administration Use with magnesium sulfate is avoided because severe hypotension can occur
	Newborn—hypotension	Monitor for adverse effects

DTRs, Deep tendon reflexes; HCP, health care provider.

4. Always administer by IV infusion via an infusion monitoring device; carefully monitor the dose being administered, and follow agency protocol for administration.
5. Keep calcium gluconate readily accessible in case of a magnesium sulfate overdose because calcium gluconate antagonizes the effect of magnesium sulfate.
6. Monitor deep tendon reflexes hourly for signs of developing toxicity.
7. Test the patellar reflex or knee jerk reflex before administering a repeat parenteral dose (used as an indicator of central nervous system depression; suppressed reflex may be a sign of impending respiratory arrest) (Table 32-2).
8. Patellar reflex must be present and respiratory rate must be greater than 12 breaths/minute (or as designated by agency protocol) before each parenteral dose.
9. Monitor intake and output hourly; output should be maintained at 25 to 30 mL/hour because the medication is eliminated through the kidneys.

! Monitor a client receiving magnesium sulfate intravenously closely for signs of toxicity. Call the HCP if respirations are less than 12 breaths/minute, indicating respiratory depression, or if any other adverse effects occur.

III. Betamethasone and Dexamethasone

- A. Description: Corticosteroids that increase the production of **surfactant** to accelerate fetal lung maturity and reduce the incidence or severity of respiratory distress syndrome
- B. Use: For a client in preterm labor between 28 and 32 weeks' gestation whose labor can be inhibited for 48 hours without jeopardizing the mother or fetus
- C. Adverse effects and contraindications
 1. May decrease the mother's resistance to infection
 2. Pulmonary edema secondary to sodium and fluid retention can occur.
 3. Elevated blood glucose levels can occur in a client with diabetes mellitus.

TABLE 32-2 Assessing Deep Tendon Reflexes

Grade	Deep Tendon Reflex Response
0	No response
1	Sluggish or diminished
2	Active or expected response
3	More brisk than expected, slightly hyperactive
4	Brisk, hyperactive, with intermittent or transient clonus

Data from Seidel H, Ball J, Dains J, Flynn J, Solomon B, Stewart R: Mosby's guide to physical examination, ed 6, St. Louis, 2011, Mosby.

- D. Interventions
1. Monitor maternal vital signs and lung sounds, and for edema.
 2. Monitor mother for signs of infection.
 3. Monitor white blood cell count.
 4. Monitor blood glucose levels.
 5. Administer by deep intramuscular injection.

IV. Opioid Analgesics

A. Description

1. Used to relieve moderate to severe pain associated with **labor**
2. Administered by intramuscular or IV route
3. Regular use of opioids during pregnancy may produce withdrawal symptoms in the newborn (irritability, excessive crying, tremors, hyperactive reflexes, fever, vomiting, diarrhea, yawning, sneezing, and seizures).
4. Antidotes for opioids
 - a. Naloxone is usually the treatment of choice because it rapidly reverses opioid toxicity; the dose may need to be repeated every few hours until opioid concentrations have decreased to nontoxic levels.
 - b. These medications can cause withdrawal in opioid-dependent clients.

B. Hydromorphone hydrochloride and meperidine hydrochloride

1. Can cause dizziness, nausea, vomiting, sedation, decreased blood pressure, decreased respirations, diaphoresis, flushed face, and urinary retention
2. May be prescribed to be administered with an antiemetic such as promethazine to prevent nausea
3. High dosages may result in respiratory depression, skeletal muscle flaccidity, cold clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.
4. Used cautiously in clients delivering preterm newborns
5. Not administered in early labor because it may slow the labor process
6. Not administered in advanced labor (within 1 to 4 hours of expected birth); if the medication is not adequately removed from the fetal circulation, respiratory depression can occur.
7. Meperidine is used less frequently than hydromorphone hydrochloride because of the risk of abnormal fetal heart rate in newborns as well as the potential for seizures in the mother.

C. Fentanyl and sufentanil can cause respiratory depression, dizziness, drowsiness, hypotension, urinary retention, and fetal narcosis and distress; sufentanil is used less commonly than fentanyl.

D. Butorphanol tartrate and nalbuphine

1. May be prescribed depending on HCP preference
2. Can cause confusion, sedation, sweating, nausea, vomiting, hypotension, and sinusoidal-like fetal heart rhythm

3. Use with caution in a client with preexisting opioid dependency, because these medications can precipitate withdrawal symptoms in the client and the newborn.

E. Interventions

1. Monitor vital signs, particularly respiratory status; if respirations are 12 breaths/minute or less, withhold the medication and contact the HCP.
2. Monitor the fetal heart rate and characteristics of uterine contractions.
3. Monitor for blood pressure changes (hypotension); maintain the client in a recumbent position (elevate the hip with a wedge pillow or other device).
4. Record the level of pain relief.
5. Monitor the bladder for distention and retention.
6. Have the antidote naloxone readily accessible, especially if delivery is expected to occur during peak medication absorption time.

 **Obtain a medication history before the administration of an opioid analgesic. Some medications may be contraindicated if the client has a history of opioid dependency, because these medications can precipitate withdrawal symptoms in the client and newborn.**

V. Prostaglandins (Box 32-1)

A. Description

1. Ripen the cervix, making it softer and causing it to begin to dilate and efface
2. Stimulate uterine contractions
3. Administered vaginally

B. Uses

1. Preinduction cervical ripening (ripening of the cervix before the induction of labor when the Bishop score is ≤ 4)
2. Induction of labor
3. Induction of abortion (abortifacient agent)

C. Adverse effects and contraindications

1. Gastrointestinal effects, including diarrhea, nausea, vomiting, and stomach cramps
2. Fever, chills, flushing, headache, and hypotension
3. Uterine tachysystole (! 12 uterine contractions in 20 minutes without an alteration in the fetal heart rate pattern)
4. Hyperstimulation of the **uterus**
5. Fetal passage of meconium
6. Contraindications (Box 32-2)

D. Interventions

BOX 32-1 Prostaglandins

Prostaglandin E₁: Misoprostol intravaginal tablet

Prostaglandin E₂: Dinoprostone vaginal gel, insert, or suppository

BOX 32-2 Contraindications to the Use of Prostaglandins

- Active cardiac, hepatic, pulmonary, or kidney disease
- Acute pelvic inflammatory disease
- Clients in whom vaginal delivery is not indicated
- Fetal malpresentation
- History of cesarean section or major uterine surgery
- History of difficult labor or traumatic labor
- Hypersensitivity to prostaglandins
- Maternal fever or infection
- Nonreassuring fetal heart rate pattern
- Placenta previa or unexplained vaginal bleeding
- Regular progressive uterine contractions
- Significant cephalopelvic disproportion

1. Monitor maternal vital signs, fetal heart rate pattern, adverse effects, and status of pregnancy, including indications for cervical ripening or the induction of labor, signs of labor or impending labor, and the Bishop score (see [Chapter 27, Table 27-2](#) for information about the Bishop score).
2. Have the client void before administration of medication and then have her maintain a supine with lateral tilt or side-lying position for 30 to 60 minutes (gel) up to 2 hours (insert) after administration, depending on the medication administered.
3. Treatment is discontinued when the Bishop score is 8 or more (cervix ripens) or an effective contraction pattern is established (3 or more contractions in a 10-minute period); in addition, signs of adverse effects indicate that the treatment needs to be discontinued.
4. Follow agency protocol for the induction of labor if cervical ripening has occurred and labor has not begun; oxytocin can be initiated if needed 6 to 12 hours after discontinuation of prostaglandin therapy.

VI. Uterine Stimulants (Oxytocics): Oxytocin

A. Description

1. Oxytocin stimulates the smooth muscle of the **uterus** and increases the force, frequency, and duration of uterine contractions.
2. Oxytocin also promotes milk letdown.
3. For induction of labor, oxytocin is administered by the IV route (other route of administration is intramuscular); if injecting intramuscularly, aspiration is necessary to avoid injection into a blood vessel.
4. Magnesium sulfate should be readily accessible in case relaxation of the myometrium is necessary.

5. Minimal cervical change usually is noted until the active phase of labor is achieved.

B. Uses

1. Induces or augments labor
2. Controls postpartum bleeding
3. Manages an incomplete abortion

C. Adverse effects and contraindications

1. Adverse effects include allergies, dysrhythmias, changes in blood pressure, uterine rupture, and water intoxication.
2. Oxytocin may produce uterine hypertonicity, resulting in fetal or maternal adverse effects.
3. High doses may cause hypotension, with rebound hypertension.
4. Postpartum hemorrhage can occur and should be monitored for because the uterus may become atonic when the medication wears off.
5. Oxytocin should not be used in a client who cannot deliver vaginally or in a client with hypertonic uterine contractions; it is also contraindicated in a client with active genital herpes.

D. Interventions

1. Monitor maternal vital signs (every 15 minutes), especially the blood pressure and heart rate, weight, intake and output, level of consciousness, and lung sounds.
2. Monitor frequency, duration, and force of contractions and resting uterine tone every 15 minutes.
3. Monitor fetal heart rate every 15 minutes, and notify the HCP if significant changes occur; use of an internal fetal scalp electrode may be prescribed.
4. Administered by IV infusion via an infusion monitoring device (most common route); prescribed additive solution is piggybacked at the port nearest the point of venous insertion (prescribed additive solution may be normal saline, lactated Ringer's, or 5% dextrose in water).
5. Carefully monitor the dose being administered; do not leave the client unattended while the oxytocin is infusing.
6. Administer oxygen if prescribed.
7. Monitor for hypertonic contractions or a nonreassuring fetal heart rate and notify the HCP if these occur (see [Priority Nursing Actions](#)).
8. Stop the medication if uterine hyperstimulation or a nonreassuring fetal heart rate occurs; turn the client on her side, increase the IV rate of the normal saline, and administer oxygen via face mask.
9. Monitor for signs of water intoxication.
10. Have emergency equipment readily accessible.
11. Document the dose of the medication and the time the medication was started, increased, maintained, and discontinued; document the client's response.

⚡ PRIORITY NURSING ACTIONS

Hypertonic Contractions or a Nonreassuring Fetal Heart Rate during Oxytocin Infusion

1. Stop the oxytocin infusion.
2. Turn the client on her side, stay with the client, and ask another nurse to contact the health care provider (HCP).
3. Increase the flow rate of the intravenous (IV) solution that does not contain the oxytocin.
4. Administer oxygen, 8 to 10 L/minute, by snug face mask.
5. Assess maternal vital signs; fetal heart rate and patterns; and frequency, duration, and force of contractions.
6. Document the event, actions taken, and the response.

Oxytocin is a uterine stimulant and stimulates the smooth muscle of the uterus and increases the force, frequency, and duration of uterine contractions. It is administered to induce or augment labor. The presence of hypertonic contractions or a nonreassuring fetal heart rate indicates the need to institute emergency measures to reduce uterine stimulation and increase fetal oxygenation. The nurse would always follow the agency's protocol regarding the procedure to follow in this event. Keeping the emergency goals of care in mind (to reduce uterine stimulation and increase fetal oxygenation) guides the nurse's actions. The oxytocin infusion needs to be stopped to reduce uterine contractions. The nurse turns the client on her side to increase placental oxygenation. The nurse never leaves a client if an emergency situation is present; the nurse asks another nurse to contact the HCP. The flow rate of the IV solution that does not contain the oxytocin is increased, and oxygen is administered. These actions also facilitate the goals of care. When these emergency actions are taken, the nurse assesses and continuously monitors maternal vital signs; fetal heart rate and patterns; and frequency, duration, and force of contractions. The nurse also implements any additional prescriptions and documents the event, actions taken, and the response.

Reference

Lowdermilk et al. (2016), p. 799.

12. Keep the client and family informed of the client's progress.
13. Calculating an oxytocin drip (Box 32-3)

VII. Medications Used to Manage Postpartum Hemorrhage (Box 32-4)

A. Ergot alkaloid

1. Description
 - a. Methylergonovine maleate is an ergot alkaloid.
 - b. Directly stimulates uterine muscle, increases the force and frequency of contractions, and produces a firm tetanic contraction of the uterus

BOX 32-3 Calculating an Oxytocin Dose

Prescription: Oxytocin 2 milliunits (mU)/minute
Available: 20 units (U) in 1000 mL 5% dextrose in Water (D5W)

How many mL per hour?

Steps for calculating:

1. Do you need to convert? Yes, you need to change mU to U
2. What has been prescribed? Oxytocin 2 mU/minute
3. What do you have available? 1000 mL D5W containing 20 U oxytocin
4. Set up formula:

Convert:

How many mU are in 1 U? There are 1000 mU in 1 U.
If there are 1000 mU in 1 U, how many U in 2 mU?

$$1000 \text{ mU} = 1 \text{ U} \quad \frac{1}{1000} \quad 2 \text{ mU} = X$$

Answer: 0.002 U in 2 mU

Now use the standard formula for calculation.

$$\text{Prescribed} = \text{Available} \hat{\wedge} \text{Volume} \\ 0.002 \text{ U} = 20 \text{ U} \hat{\wedge} 1000 \text{ mL} \quad \frac{1}{1000} \quad 0.1 \text{ mL}$$

Now, determine how many mL should be given in 1 hour if the prescription is for 0.1 mL/minute. 0.1 mL/minute $\hat{\wedge}$ 60 minutes/1 hour $\frac{1}{6}$ mL/hr

Reference: Gahart B, Nazareno A: 2015 intravenous medications, ed 31, St. Louis, 2015, Mosby.

Note: Many electronic pumps allow for programming in units or milliunits per minute, eliminating the need to calculate the mL per hour, and this practice is recommended if available because medications are programmed in the pumps with dosage safeguards. If a dose that is too low or too high is programmed into the pump, the pump will flag or will not allow the nurse to proceed with administration.

BOX 32-4 Medications Used to Manage Postpartum Hemorrhage

- Methylergonovine
- Oxytocin
- Prostaglandin F_{2α}: Carboprost tromethamine

- c. Can produce arterial vasoconstriction and vasospasm of the coronary arteries
 - d. An ergot alkaloid is administered postpartum and is not administered before the birth of the placenta.
2. Uses
 - a. Postpartum hemorrhage
 - b. Postabortal hemorrhage resulting from atony or involution
 3. Adverse effects and contraindications
 - a. Can cause nausea, uterine cramping, bradycardia, dysrhythmias, myocardial infarction, and severe hypertension

- b. High doses are associated with peripheral vasospasm or vasoconstriction, angina, miosis, confusion, respiratory depression, seizures, or unconsciousness; uterine tetany can occur.
 - c. Contraindicated during pregnancy and in clients with significant cardiovascular disease, peripheral vascular disease, or hypertension
4. Interventions
 - a. Monitor maternal vital signs, weight, intake and output, level of consciousness, and lung sounds.
 - b. Monitor the blood pressure closely; the medication produces vasoconstriction, and if an increase in blood pressure is noted, withhold the medication and notify the HCP.
 - c. Monitor uterine contractions (frequency, strength, and duration).
 - d. Assess for chest pain, headache, shortness of breath, itching, pale or cold hands or feet, nausea, diarrhea, and dizziness.
 - e. Assess the extremities for color, warmth, movement, and pain.
 - f. Assess vaginal bleeding.
 - g. Notify the HCP if chest pain or other adverse effects occur.
 - h. Administer analgesics as prescribed; they may be required because the medication produces painful uterine contractions.

 **Check the client's blood pressure before administering methylergonovine maleate. This medication can cause severe hypertension and is contraindicated in a client with hypertension.**

- B. Prostaglandin $F_{2\alpha}$: carboprost tromethamine
 1. Description: Contracts the uterus
 2. Uses: Postpartum hemorrhage
 3. Adverse effects and contraindications
 - a. Can cause headache, nausea, vomiting, diarrhea, fever, tachycardia, and hypertension
 - b. Contraindicated if the client has asthma
 4. Interventions
 - a. Monitor vital signs.
 - b. Monitor vaginal bleeding and uterine tone.
- C. Oxytocin: See Section VI on uterine stimulants.

VIII. Rh_o(D) Immune Globulin

- A. Description
 1. Prevention of anti-Rh_o(D) antibody formation is most successful if the medication is administered twice, at 28 weeks' gestation and again within 72 hours after delivery.
 2. Rh_o(D) immune globulin also should be administered within 72 hours after potential or actual exposure to Rh-positive blood and must be given with each subsequent exposure or potential exposure to Rh-positive blood.

- B. Use: To prevent isoimmunization in Rh-negative clients who are negative for Rh antibodies and exposed or potentially exposed to Rh-positive red blood cells by amniocentesis, chorionic villus sampling, transfusion, termination of pregnancy, abdominal trauma, or bleeding during pregnancy or the birth process
- C. Adverse effects and contraindications
 1. Elevated temperature
 2. Tenderness at the injection site
 3. Contraindicated for Rh-positive clients
 4. Contraindicated in clients with a history of systemic allergic reactions to preparations containing human immunoglobulins
 5. Note: Not administered to a newborn
- D. Interventions
 1. Administer to the client by intramuscular injection at 28 weeks' gestation and within 72 hours after delivery.
 2. Never administer by the IV route.
 3. Monitor for temperature elevation.
 4. Monitor injection site for tenderness.

 **Rh_o(D) immune globulin is of no benefit when the client has developed a positive antibody titer to the Rh antigen.**

IX. Rubella Vaccine

- A. Given subcutaneously before hospital discharge to a nonimmune postpartum client
- B. Administered if the rubella titer is less than 1:8
- C. Adverse effects: Transient rash, hypersensitivity
- D. Contraindicated in a client with a hypersensitivity to eggs (check with the HCP regarding administration)
- E. Interventions
 1. Assess for allergy to duck eggs and notify the HCP before administration if an allergy exists.
 2. Do not administer if the client or other family members are immunocompromised.

 **The client should avoid pregnancy for 1 to 3 months (or as prescribed) after immunization with rubella vaccine. Inform the client about the need to use a contraception method during this time.**

X. Lung Surfactants

- A. Description
 1. Replenish surfactant and restore surface activity to the lungs to prevent and treat respiratory distress syndrome.
 2. Administered to the newborn by the intratracheal route.
- B. Use: To prevent or treat respiratory distress syndrome in premature newborns
- C. Adverse effects and contraindications
 1. Adverse effects include transient bradycardia and oxygen desaturation; pulmonary hemorrhage, mucus plugging, and endotracheal tube reflux can also occur.

2. Surfactants are administered with caution in newborns at risk for circulatory overload.

D. Interventions

1. Instill surfactant through the catheter inserted into the newborn's endotracheal tube; avoid suctioning for at least 2 hours after administration.
2. Monitor for bradycardia and decreased oxygen saturation during administration.
3. Monitor respiratory status and lung sounds and for signs of adverse effects.

XI. Eye Prophylaxis for the Newborn

A. Description

1. Preventive eye treatment against ophthalmia neonatorum in the newborn is required by law in the United States.
2. Ophthalmic forms of erythromycin are prescribed because it is bacteriostatic and bactericidal and provides prophylaxis against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*.

B. Use: As a prophylactic measure to protect against *N. gonorrhoeae* and *C. trachomatis*

C. Interventions

1. Clean the newborn's eyes before instilling the medication.
2. Do not flush the eyes after instillation.

 **Instillation of eye medication can be delayed for 1 hour after birth to facilitate eye contact and parent-newborn attachment and bonding.**

XII. Phytonadione

A. Description

1. The newborn is at risk for hemorrhagic disorders; coagulation factors synthesized in the liver depend on phytonadione (also known as vitamin K), which is not synthesized until intestinal bacteria are present.
2. Newborns are deficient in phytonadione for the first 5 to 8 days of life because of the lack of intestinal bacteria.

B. Use: Prophylaxis and treatment of hemorrhagic disease of the newborn

C. Adverse effect: Can cause hyperbilirubinemia in the newborn (occurrence is rare).

D. Interventions

1. Protect the medication from light.
2. Administer during the early newborn period.
3. Administer by the intramuscular route in the lateral aspect of the middle third of the vastus lateralis muscle of the thigh.
4. Monitor for bruising at the injection site and for bleeding from the cord.
5. Monitor for jaundice and monitor the bilirubin level because, although rare, the medication can cause hyperbilirubinemia in the newborn.

XIII. Hepatitis B Vaccine, Recombinant

A. Description: Given intramuscularly to the newborn before discharge home

B. Use: Recommended for all newborns to prevent hepatitis B

C. Adverse effects: Rash, fever, erythema, and pain at injection site

D. Interventions

1. Parental consent must be obtained.
2. Administer intramuscularly in the lateral aspect of the middle third of the vastus lateralis muscle.
3. If the infant was born to a mother positive for hepatitis B surface antigen, hepatitis B immune globulin should be given within 12 hours of birth in addition to hepatitis B vaccine. Then follow the regularly scheduled hepatitis B vaccination schedule.
4. Document immunization administration on a vaccination card so that the parents have a record that the vaccine was administered.

CRITICAL THINKING What Should You Do?

Answer: The nurse should seek a prescription from the health care provider for the administration of Rh_o(D) immune globulin. Rh_o(D) immune globulin is administered to prevent isoimmunization in Rh-negative clients who are negative for Rh antibodies and exposed or potentially exposed to Rh-positive red blood cells from the fetus by amniocentesis or chorionic villus sampling, transfusion, termination of pregnancy, abdominal trauma, or bleeding during pregnancy or the birth process. It is administered to the Rh-negative client by intramuscular injection at 28 weeks' gestation and within 72 hours after delivery. The indirect Coombs' test or antibody screening test must be negative (absence of any Rh antibodies).

Reference: Lowdermilk et al. (2016), pp. 884–885.

PRACTICE QUESTIONS

- ❖ 334. The nurse is monitoring a client who is receiving oxytocin to induce labor. Which assessment findings should cause the nurse to immediately discontinue the oxytocin infusion? Select all that apply.
- 1. Fatigue
 - 2. Drowsiness
 - 3. Uterine hyperstimulation
 - 4. Late decelerations of the fetal heart rate
 - 5. Early decelerations of the fetal heart rate
- ❖ 335. A pregnant client is receiving magnesium sulfate for the management of preeclampsia. The nurse determines that the client is experiencing toxicity from the medication if which findings are noted on assessment? Select all that apply.
- 1. Proteinuria of 3+
 - 2. Respirations of 10 breaths/minute

3. Presence of deep tendon reflexes
4. Urine output of 20 mL in an hour
5. Serum magnesium level of 4 mEq/L (2 mmol/L)
336. The nurse asks a nursing student to describe the procedure for administering erythromycin ointment to the eyes of a newborn. Which student statement indicates that further teaching is needed about administration of the eye medication?
1. "I will flush the eyes after instilling the ointment."
 2. "I will clean the newborn's eyes before instilling ointment."
 3. "I need to administer the eye ointment within 1 hour after delivery."
 4. "I will instill the eye ointment into each of the newborn's conjunctival sacs."
337. A client in preterm labor (31 weeks) who is dilated to 4 cm has been started on magnesium sulfate and contractions have stopped. If the client's labor can be inhibited for the next 48 hours, the nurse anticipates a prescription for which medication?
1. Nalbuphine
 2. Betamethasone
 3. Rh_o(D) immune globulin
 4. Dinoprostone vaginal insert
338. Methylergonovine is prescribed for a woman to treat postpartum hemorrhage. Before administration of methylergonovine, what is the priority assessment?
1. Uterine tone
 2. Blood pressure
 3. Amount of lochia
 4. Deep tendon reflexes
339. The nurse is preparing to administer exogenous surfactant to a premature infant who has respiratory distress syndrome. The nurse prepares to administer the medication by which route?
1. Intradermal
 2. Intratracheal
 3. Subcutaneous
 4. Intramuscular
340. An opioid analgesic is administered to a client in labor. The nurse assigned to care for the client ensures that which medication is readily accessible should respiratory depression occur?
1. Naloxone
 2. Morphine sulfate
 3. Betamethasone
 4. Hydromorphone hydrochloride
341. Rh_o(D) immune globulin is prescribed for a client after delivery and the nurse provides information to the client about the purpose of the medication. The nurse determines that the woman understands the purpose if the woman states that it will protect her next baby from which condition?
1. Having Rh-positive blood
 2. Developing a rubella infection
 3. Developing physiological jaundice
 4. Being affected by Rh incompatibility
342. Methylergonovine is prescribed for a client with postpartum hemorrhage. Before administering the medication, the nurse should contact the health care provider who prescribed the medication if which condition is documented in the client's medical history?
1. Hypotension
 2. Hypothyroidism
 3. Diabetes mellitus
 4. Peripheral vascular disease
- ❖ 343. The nurse is monitoring a client in preterm labor who is receiving intravenous magnesium sulfate. The nurse should monitor for which adverse effects of this medication? Select all that apply.
1. Flushing
2. Hypertension
3. Increased urine output
4. Depressed respirations
5. Extreme muscle weakness
6. Hyperactive deep tendon reflexes

ANSWERS

❖ 334. 3, 4

Rationale: Oxytocin stimulates uterine contractions and is a pharmacological method to induce labor. Late decelerations, a nonreassuring fetal heart rate pattern, is an ominous sign indicating fetal distress. Oxytocin infusion must be stopped when any signs of uterine hyperstimulation, late decelerations, or other adverse effects occur. Some health care providers prescribe the administration of oxytocin in 10-minute pulsed infusions rather than as a continuous infusion. This pulsed

method, which is more like endogenous secretion of oxytocin, is reported to be effective for labor induction and requires significantly less oxytocin use. Drowsiness and fatigue may be caused by the labor experience. Early decelerations of the fetal heart rate are a reassuring sign and do not indicate fetal distress. Test-Taking Strategy: Note the **strategic word**, immediately. Focus on the **subject**, an adverse effect of oxytocin. Options 1 and 2 are **comparable or alike** and can be eliminated first. From the remaining options, recalling that early decelerations of the fetal heart rate are a reassuring sign will direct you to the correct option.

❖ 335. 2, 4

Rationale: Magnesium toxicity can occur from magnesium sulfate therapy. Signs of magnesium sulfate toxicity relate to the central nervous system depressant effects of the medication and include respiratory depression, loss of deep tendon reflexes, and a sudden decline in fetal heart rate and maternal heart rate and blood pressure. Respiratory rate below 12 breaths per minute is a sign of toxicity. Urine output should be at least 25 to 30 mL per hour. Proteinuria of 3+ is an expected finding in a client with preeclampsia. Presence of deep tendon reflexes is a normal and expected finding. Therapeutic serum levels of magnesium are 4 to 7.5 mEq/L (2 to 3.75 mmol/L).

Test-Taking Strategy: Focus on the **subject**, magnesium toxicity. Eliminate option 3 first because it is a normal finding. Next, eliminate option 5, knowing that the therapeutic serum level of magnesium is 4 to 7.5 mEq/L (2 to 3.75 mmol/L). From the remaining options, recalling that proteinuria of 3+ would be noted and expected in a client with preeclampsia will direct you to the correct options.

336. 1

Rationale: Eye prophylaxis protects the newborn against *Neisseria gonorrhoeae* and *Chlamydia trachomatis*. The eyes are not flushed after instillation of the medication because the flush would wash away the administered medication. Options 2, 3, and 4 are correct statements regarding the procedure for administering eye medication to the newborn.

Test-Taking Strategy: Note the **strategic words**, further teaching is needed. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Eliminate options 3 and 4 first because they are **comparable or alike** and relate to instilling the eye medication. From the remaining options, visualize the effect of each. This will direct you to the correct option.

Review: Procedure for administering **eye prophylaxis** to the newborn

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Health Promotion; Infection

Reference: Lowdermilk et al. (2016), p. 569.

337. 2

Rationale: Betamethasone, a glucocorticoid, is given to increase the production of surfactant to stimulate fetal lung maturation. It is administered to clients in preterm labor at 28 to 32 weeks of gestation if the labor can be inhibited for 48 hours. Nalbuphine is an opioid analgesic. Rh₀(D) immune globulin is given to Rh-negative clients to prevent sensitization. Dinoprostone vaginal insert is a prostaglandin given to ripen and soften the cervix and to stimulate uterine contractions.

Test-Taking Strategy: Focus on the **subject**, a client at 31 weeks' gestation. Recall that the preterm infant is at risk for respiratory distress syndrome because of immaturity and the inability to produce surfactant. Next, recalling the actions of the medications in the options and that betamethasone is used to increase the production of surfactant will direct you to the correct option.

Review: **Betamethasone**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Analysis

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Gas Exchange; Perfusion

Reference: Lowdermilk et al. (2016), p. 769.

338. 2

Rationale: Methylergonovine, an ergot alkaloid, is used to prevent or control postpartum hemorrhage by contracting the uterus. Methylergonovine causes continuous uterine contractions and may elevate the blood pressure. A priority assessment before the administration of the medication is to check the blood pressure. The health care provider needs to be notified if hypertension is present. Although options 1, 3, and 4 may be components of the postpartum assessment, blood pressure is related specifically to the administration of this medication. Test-Taking Strategy: Note the **strategic word**, priority. Eliminate options 1 and 3 first because they are **comparable or alike** and related to one another. To choose from the remaining options, use the **ABCs—airway—breathing—circulation**. Blood pressure is a method of assessing circulation.

Review: Adverse effects of **methylergonovine**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Clotting; Reproduction

Reference: Burchum, Rosenthal (2016), p. 787.

339. 2

Rationale: Respiratory distress syndrome is a serious lung disorder caused by immaturity and the inability to produce surfactant, resulting in hypoxia and acidosis. It is common in premature infants and may be due to lung immaturity as a

result of surfactant deficiency. The mainstay of treatment is the administration of exogenous surfactant, which is administered by the intratracheal route. Options 1, 3, and 4 are not routes of administration for this medication.

Test-Taking Strategy: Focus on the **subject**, route of administration for exogenous surfactant. Note the relationship between the diagnosis, respiratory distress syndrome, and the correct option, intratracheal.

Review: **Surfactant**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Development; Gas Exchange

References: Lowdermilk et al. (2016), p. 825; Burchum, Rosenthal (2016), pp. 1305–1306.

340. 1

Rationale: Opioid analgesics may be prescribed to relieve moderate to severe pain associated with labor. Opioid toxicity can occur and cause respiratory depression. Naloxone is an opioid antagonist, which reverses the effects of opioids and is given for respiratory depression. Morphine sulfate and hydromorphone hydrochloride are opioid analgesics. Beta-methasone is a corticosteroid administered to enhance fetal lung maturity.

Test-Taking Strategy: Focus on the **subject**, the antidote for respiratory depression. Eliminate options 2 and 4 first because they are **comparable or alike** and are opioid analgesics. Next, eliminate option 3, knowing that this medication is a corticosteroid.

Review: **Antidote** for **opioid toxicity**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Gas Exchange; Safety

References: Lowdermilk et al. (2016), p. 395; Burchum, Rosenthal (2016), p. 266.

341. 4

Rationale: Rh incompatibility can occur when an Rh-negative mother becomes sensitized to the Rh antigen. Sensitization may develop when an Rh-negative woman becomes pregnant with a fetus who is Rh positive. During pregnancy and at delivery, some of the fetus's Rh-positive blood can enter the maternal circulation, causing the mother's immune system to form antibodies against Rh-positive blood. Administration of Rh_o(D) immune globulin prevents the mother from developing antibodies against Rh-positive blood by providing passive antibody protection against the Rh antigen.

Test-Taking Strategy: Note the **subject**, the purpose of Rh_o(D) immune globulin. Noting the relationship between the name

of the medication, Rh_o(D) immune globulin, and the word incompatibility in the correct option will direct you to this option.

Review: The purpose of **Rh_o(D) immune globulin**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Health Promotion; Reproduction

Reference: Lowdermilk et al. (2016), p. 494.

342. 4

Rationale: Methylergonovine is an ergot alkaloid used to treat postpartum hemorrhage. Ergot alkaloids are contraindicated in clients with significant cardiovascular disease, peripheral vascular disease, hypertension, preeclampsia, or eclampsia. These conditions are worsened by the vasoconstrictive effects of the ergot alkaloids. Options 1, 2, and 3 are not contraindications related to the use of ergot alkaloids.

Test-Taking Strategy: Focus on the **subject**, the purpose, action, and contraindications of methylergonovine. Recalling that ergot alkaloids produce vasoconstriction will direct you to the correct option.

Review: The purpose and action of **methylergonovine**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Pharmacology—Reproductive/Maternity/Newborn Medications

Priority Concepts: Collaboration; Safety

Reference: Lowdermilk et al. (2016), p. 668.

❖ 343. 1, 4, 5

Rationale: Magnesium sulfate is a central nervous system depressant and relaxes smooth muscle, including the uterus. It is used to halt preterm labor contractions and is used for pre-eclamptic clients to prevent seizures. Adverse effects include flushing, depressed respirations, depressed deep tendon reflexes, hypotension, extreme muscle weakness, decreased urine output, pulmonary edema, and elevated serum magnesium levels.

Test-Taking Strategy: Focus on the **subject**, adverse effects of magnesium sulfate. Recalling that this medication is a central nervous system depressant and relaxes smooth muscle will assist you in choosing the correct options.

Review: Adverse effects of **magnesium sulfate**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

UNIT VII

Pediatric Nursing

Pyramid to Success

Pyramid Points focus on growth and development, safety, and age-appropriate measures to ensure a safe and hazard-free environment for the child; on protection of the child and the prevention of accidents; and on acute disorders that can occur in children. The focus is on nutrition, specific feeding techniques, positioning techniques, and interventions that will provide and maintain adequate airway, breathing, and circulation patterns in the child. In addition, neglect and/or abuse of the child is a focus. On the NCLEX-RN® examination, be alert to the age of the child if the age is presented in a question. If an age is presented in the question, think about the specific growth and development characteristics of the age group to answer the question correctly.

Client Needs: Learning Objectives

Safe and Effective Care Environment

- Communicating with interprofessional health care team members
- Considering issues related to informed consent regarding minors
- Delegating care safely
- Ensuring environmental safety, including home safety and personal safety, related to the developmental age of the child
- Establishing priorities
- Instituting measures related to the spread and control of infectious agents, particularly communicable diseases
- Maintaining confidentiality
- Preventing errors and accidents
- Protecting the child and other contacts to prevent illness
- Providing continuity of care
- Providing protective measures
- Upholding parent and child rights

Health Promotion and Maintenance

- Ensuring that immunization schedules are up to date
- Focusing on developmental stages when planning care
- Performing physical assessment techniques specific to the pediatric client
- Preventing disease in the pediatric population
- Providing health promotion programs for the pediatric client
- Providing instructions to the child and parents regarding care at home

Psychosocial Integrity

- Assessing the child for neglect and/or abuse
- Communicating with the pediatric client
- Considering concepts of family dynamics when planning care
- Considering cultural, religious, and spiritual beliefs when planning care
- Considering end-of-life issues and grief and loss in the pediatric population
- Identifying family and support systems for the child
- Providing play therapies

Physiological Integrity

- Following medication administration procedures
- Following nutritional guidelines for the pediatric population
- Identifying comfort measures appropriate for the child
- Maintaining sensitivity for intrusive procedures needed for the pediatric client
- Managing childhood illnesses
- Monitoring elimination patterns
- Monitoring for age-appropriate normal body structure and function
- Monitoring for infectious diseases of the pediatric client
- Monitoring for responses to treatments
- Providing for consistent rest and sleep patterns
- Responding to medical emergencies

Integumentary Disorders

PRIORITY CONCEPTS Infection; Tissue Integrity

CRITICAL THINKING What Should You Do?

A child being admitted to the pediatric unit is suspected of having impetigo. In order to prevent the spread of this infectious disease, what should the nurse do?

Answer located on p. 407.

I. Eczema (Atopic Dermatitis)

A. Description

1. Superficial inflammatory process involving primarily the epidermis
2. Associated with family history of the disorder, allergies, asthma, or allergic rhinitis
3. The major goals of management are to relieve pruritus, lubricate the skin, reduce inflammation, and prevent or control secondary infections.

B. Forms of eczema (Box 33-1)

C. Assessment

1. Redness
2. Scaliness
3. Itching
4. Minute papules (firm, elevated, circumscribed lesions < 1 cm in diameter) and vesicles (similar to papules, but fluid-filled)
5. Weeping, oozing, and crusting of lesions
6. Adolescent and early adult forms: Commonly occur in antecubital and popliteal areas

D. Interventions

1. Avoid exposure to skin irritants such as soaps, detergents, fabric softeners, diaper wipes, and powder.
2. Avoid excessive bathing and washing of affected areas; bathing water should be tepid, and the skin should be lubricated immediately after the bath.
3. Intermittently apply cool, wet compresses for short periods to soothe the skin and alleviate itching; pat skin dry between cooling treatments.

4. Administer antihistamines and topical corticosteroids as prescribed; corticosteroids are applied in a thin layer and are rubbed into the area thoroughly.
5. Administer medications as prescribed.
6. Administer prescribed antibiotics if secondary infections occur.
7. Prevent or minimize scratching; keep nails short and clean, and place gloves or cotton socks over the hands.
8. Eliminate conditions that increase itching, such as wet diapers, excessive bathing, ambient heat, woolen clothes or blankets, and rough fabrics or furry stuffed animals; exposure to latex should also be avoided.
9. Instruct parents to wash clothing in a mild detergent and rinse thoroughly; putting the clothes through a second complete wash cycle without detergent minimizes the residue remaining on the fabric.
10. Instruct parents about measures to prevent skin infections.
11. Instruct parents to monitor lesions for signs of infection (honey-colored crusts with surrounding erythema) and to seek immediate medical intervention if such signs are noted.

 A child with an integumentary disorder needs to be monitored for signs of either a skin infection or a systemic infection.

II. Impetigo

A. Description

1. Impetigo is a contagious bacterial infection of the skin caused by β -hemolytic streptococci or staphylococci, or both; it occurs most commonly during hot, humid months.
2. Impetigo can occur because of poor hygiene; it can be a primary infection or occur secondarily at a site that has been injured or sustained an insect bite, or at a site that was originally a rash, such as atopic dermatitis or poison ivy or poison oak.

BOX 33-1 Forms of Eczema

Infantile: Usually begins at 2 to 6 months of age and decreases in incidence with aging; spontaneous remission may occur by 3 years

Childhood: May follow the infantile form; occurs at 2 to 3 years of age

Preadolescent and Adolescent: Begins at about 12 years of age and may continue into the early adult years or indefinitely

3. The most common sites of infection are on the face and around the mouth, and then on the hands, neck, and extremities.
4. The lesions begin as vesicles or pustules surrounded by edema and redness (a pustule is similar to a vesicle except that its fluid content is purulent).
5. The lesions progress to an exudative and crusting stage; after the crusting of the lesions, the initially serous vesicular fluid becomes cloudy, and the vesicles rupture, leaving honey-colored crusts covering ulcerated bases.

B. Assessment (Fig. 33-1)

1. Lesions
2. Erythema
3. Pruritus
4. Burning
5. Secondary lymph node involvement

C. Interventions

1. Institute contact isolation; use standard precautions and implement agency-specific isolation procedures for the hospitalized child; strict hygiene practices are important because impetigo is a highly contagious condition.
2. Allow lesions to dry by air exposure.
3. Assist the child with daily bathing with antibacterial soap, as prescribed.

FIGURE 33-1 Impetigo contagiosa. (From Weston, Lane, 2007.)

4. Apply warm saline or other prescribed compresses to the lesions 2 or 3 times daily, followed by mild soap and water to soften crusts for removal and promote healing; Burow's solution may also be prescribed to soften the crusts.
5. Apply topical antibiotic ointments with a clean/sterile cotton swab without touching the tube opening with fingers or skin, and instruct parents in the ointment and swab use; the infection is still communicable for 48 hours beyond initiation of antibiotic treatment.
6. Administer oral antibiotics, which may be prescribed if there is no response to topical antibiotic treatment; it is extremely important to comply with the prescribed antibiotic regimen because secondary infections such as glomerulonephritis may result if the infectious agent is of a streptococcal type that can affect the nephrons.
7. To prevent skin cracking, apply emollients and instruct parents in the use of emollients.
8. Instruct parents in the methods to prevent the spread of the infection, especially careful hand-washing.
9. Inform parents that the child needs to use separate towels, linens, and dishes.
10. Inform parents that all linens and clothing used by the child should be washed with detergent in hot water separately from the linens and clothing of other household members.

III. Pediculosis Capitis (Lice)**A. Description**

1. Pediculosis capitis refers to an infestation of the hair and scalp with lice.
2. The most common sites of involvement are the occipital area, behind the ears at the nape of the neck, and occasionally the eyebrows and eyelashes.
3. The female louse lays her eggs (nits) on the hair shaft, close to the scalp; the incubation period is 7 to 10 days.
4. Lice can survive for 48 hours away from the host; nits shed in the environment can hatch in 7 to 10 days.
5. Head lice live and reproduce only on humans and are transmitted by direct and indirect contact, such as sharing of brushes, hats, towels, and bedding.
6. All contacts of the infested child, especially siblings, should be examined for lice infestation and referred for treatment as appropriate.

B. Assessment (Box 33-2)**C. Interventions**

1. Use a pediculicide product as prescribed; follow package instructions for timing the application and for contraindications for use in children.
2. Daily removal of nits with an extra-fine-tooth metal nit comb should be done as a control

BOX 33-2 Assessment Findings: Pediculosis Capitis

Child scratches scalp excessively.

Pruritus is caused by the crawling insect and insect saliva on the skin.

Nits (white eggs) are observable on the hair shaft (it is important to differentiate nits from lint or dandruff, which flakes away easily).

Adult lice are difficult to see and appear as small tan or grayish specks, which may crawl quickly.

measure after use of the pediculicide product (gloves should be worn for removal of nits); hair-brushes or combs should be discarded or soaked in boiling water for 10 minutes or in a commercially available lice-killing product for 1 hour.

3. Instruct parents that siblings may also need treatment; grooming items should not be shared, and a single comb or brush should be used for each individual child.
4. Instruct parents that bedding and clothing used by the child should be changed daily, laundered in hot water with detergent, and dried in a hot dryer for 20 minutes; this process should continue for 1 week.
5. Instruct parents that nonessential bedding and clothing can be stored in a tightly sealed plastic bag for 2 weeks and then washed.
6. Instruct parents to seal toys that cannot be washed or dry-cleaned in a plastic bag for 2 weeks.
7. Instruct parents that furniture and carpets need to be vacuumed frequently and that the dust bag from the vacuum should be discarded after vacuuming.
8. Teach the child not to share clothing, headwear, brushes, and combs.
9. Lice on the eyelashes or eyebrows may need to be removed manually.

IV. Scabies**A. Description**

1. Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite) (see [Chapter 47](#)).
2. Scabies is endemic among schoolchildren and institutionalized populations as a result of close personal contact.
3. Incubation period
 - a. The female mite burrows into the epidermis, lays eggs, and dies in the burrow after 4 to 5 weeks.
 - b. The eggs hatch in 3 to 5 days, and larvae mature and complete their life cycle.
4. Infectious period: During the entire course of the infestation

BOX 33-3 Assessment Findings: Scabies

- Pruritic papular rash
- Burrows into the skin (fine grayish red lines that may be difficult to see)

B. Assessment ([Box 33-3](#) and [Fig. 33-2](#))

! Scabies is transmitted by close personal contact with an infected person. Household members and contacts of an infected child need to be treated simultaneously.

C. Interventions

1. Topical application of a scabicide such as permethrin kills the mites.
2. Lindane shampoo, one product that may be prescribed, should not be used in children younger than 2 years because of the risk of neurotoxicity and seizures.
3. Instruct parents in the application of the scabicide.
4. When permethrin is used, it is applied to cool dry skin at least 30 minutes after bathing; the cream is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of the feet (avoid contact with the eyes), left on the skin for 8 to 14 hours, and then removed by bathing; a repeat treatment may be necessary.
5. Instruct the parents about the importance of frequent hand washing.
6. Instruct the parents that all clothing, bedding, and pillowcases used by the child need to be changed daily, washed in hot water with detergent, dried in a hot dryer, and ironed before reuse; this process should continue for 1 week.
7. Instruct parents that nonwashable toys and other items should be sealed in plastic bags for at least 4 days.
8. Anti-itch topical treatment may be necessary, and antibiotics may be prescribed if a secondary infection develops.

FIGURE 33-2 Scabies rash on an infant. (From Calen et al., 1993. Courtesy Dr. Steve Estes.)

V. Burn Injuries (see Priority Nursing Actions)

⚡ PRIORITY NURSING ACTIONS**A Major Burn Injury in the Child**

1. Stop the burning process.
2. Assess the ABCs—airway—breathing—circulation.
3. Begin resuscitation measures if necessary.
4. Remove burned clothing and jewelry.
5. Cover the wound(s) with a clean cloth.
6. Keep the child warm.
7. Transport the child to the emergency department.

The initial management of the burn injury begins at the scene of the injury. The first priority is to stop the burning process; this must be done before other interventions. To stop the burning process, flames should be smothered. The child should be placed in a horizontal position because a vertical position may cause the hair to ignite or the inhalation of flames, heat, or smoke. The child should be rolled in a blanket or other article, taking care not to cover the face and head because of the danger of inhaling smoke and fumes. As soon as the flames are extinguished, the child is assessed for adequate airway, breathing, and circulation. Measures are taken immediately if resuscitation is necessary. Burned clothing and jewelry are removed to prevent further burning of the skin and disruption of skin integrity, and then the burn is covered with a clean cloth, which prevents contamination of the wound, reduces pain by eliminating air contact, and prevents hypothermia. The child is also kept warm to prevent hypothermia and is immediately transported to the nearest emergency facility.

Reference

Hockenberry, Wilson (2015), p. 977.

A. Pediatric considerations

1. Very young children who have been burned severely have a higher mortality rate than older children and adults with comparable burns.
2. Lower burn temperatures and shorter exposure to heat can cause a more severe burn in a child than in an adult because a child's skin is thinner.
3. The degree of pain experienced by the child and the ability to communicate it are different than in an adult with the same exposure.
4. Severely burned children are at increased risk for fluid and heat loss, dehydration, and metabolic acidosis compared with adults.
5. The higher proportion of body fluid to body mass in children increases the risk of cardiovascular problems.
6. Burns involving more than 10% of the total body surface area require some form of fluid resuscitation.
7. Infants and children are at increased risk for protein and calorie deficiency because they have

smaller muscle mass and less body fat than adults.

8. Scarring is more severe in a child; disturbed body image is a distinct issue for a child or adolescent, especially as **growth** continues.
 9. An immature immune system presents an increased risk of infection for infants and young children.
 10. A delay in growth may occur after a burn.
- B. Extent of burn injury**
1. The rule of nines, used for adults with burn injuries, gives an inaccurate estimate in children because of the difference in body proportions between children and adults.
 2. In a pediatric client, the extent of the burn is expressed as a percentage of the total body surface area, using age-related charts (Fig. 33-3).
- C. Fluid replacement therapy**

⚠ To determine adequacy of fluid resuscitation, vital signs (especially heart rate), urine output, adequacy of capillary filling, and sensorium status are assessed.

1. Fluid replacement is necessary during the initial 24-hour period after burn injury because of the fluid shifts that occur as a result of the injury.
2. Several formulas are available to calculate the child's fluid needs, and the formula used depends on the health care provider's preference.
3. Crystalloid solutions are used during the initial phase of therapy; colloid solutions such as albumin, Plasma-Lyte (combined electrolyte solution), or fresh-frozen plasma are useful in maintaining plasma volume.
4. See also Chapter 47.

CRITICAL THINKING What Should You Do?

Answer: For a child suspected of having impetigo, the nurse should institute strict contact precautions and use standard precautions. The nurse should also implement agency-specific isolation procedures for the hospitalized child. Strict hygiene practices are important because impetigo is a highly contagious condition. The nurse should ensure that all health care workers and visitors are aware of the necessary precautions in order to prevent the spread of infection. For the nonhospitalized child, the nurse needs to instruct parents in the methods to prevent the spread of the infection, especially hand-washing technique. The nurse should also inform parents that the child needs to use separate towels, linens, and dishes and that all linens and clothing used by the child should be washed with detergent in hot water separately from the linens and clothing of other household members.

Reference: Hockenberry, Wilson (2015), pp. 227, 902-903.

FIGURE 33-3 Estimation of distribution of burns in children. A, Children from birth to age 5 years. B, Older children.

PRACTICE QUESTIONS

344. The nurse is monitoring a child with burns during treatment for burn shock. Which assessment provides the most accurate guide to determine the adequacy of fluid resuscitation?
1. Skin turgor
 2. Level of edema at burn site
 3. Adequacy of capillary filling
 4. Amount of fluid tolerated in 24 hours
345. The mother of a 3-year-old child arrives at a clinic and tells the nurse that the child has been scratching the skin continuously and has developed a rash. The nurse assesses the child and suspects the presence of scabies. The nurse bases this suspicion on which finding noted on assessment of the child's skin?
1. Fine grayish red lines
 2. Purple-colored lesions
 3. Thick, honey-colored crusts
 4. Clusters of fluid-filled vesicles
346. Permethrin is prescribed for a child with a diagnosis of scabies. The nurse should give which instruction to the parents regarding the use of this treatment?
1. Apply the lotion to areas of the rash only.
 2. Apply the lotion and leave it on for 6 hours.
 3. Avoid putting clothes on the child over the lotion.
 4. Apply the lotion to cool, dry skin at least 30 minutes after bathing.
347. The school nurse has provided an instructional session about impetigo to parents of the children attending the school. Which statement, if made by a parent, indicates a need for further instruction?
1. "It is extremely contagious."
 2. "It is most common in humid weather."
 3. "Lesions most often are located on the arms and chest."
 4. "It might show up in an area of broken skin, such as an insect bite."

348. The clinic nurse is reviewing the health care provider's prescription for a child who has been diagnosed with scabies. Lindane has been prescribed for the child. The nurse questions the prescription if which is noted in the child's record?
1. The child is 18 months old.
 2. The child is being bottle-fed.
 3. A sibling is using lindane for the treatment of scabies.
 4. The child has a history of frequent respiratory infections.
349. A topical corticosteroid is prescribed by the health care provider for a child with atopic dermatitis (eczema). Which instruction should the nurse give the parent about applying the cream?
1. Apply the cream over the entire body.
 2. Apply a thick layer of cream to affected areas only.
 3. Avoid cleansing the area before application of the cream.
 4. Apply a thin layer of cream and rub it into the area thoroughly.
350. The school nurse is performing pediculosis capitis (head lice) assessments. Which assessment finding indicates that a child has a "positive" head check?
1. Maculopapular lesions behind the ears
 2. Lesions in the scalp that extend to the hairline or neck
 3. White flaky particles throughout the entire scalp region
 4. White sacs attached to the hair shafts in the occipital area
- ❖ 351. The nurse caring for a child who sustained a burn injury plans care based on which pediatric considerations associated with this injury? Select all that apply.
- 1. Scarring is less severe in a child than in an adult.
 - 2. A delay in growth may occur after a burn injury.
 - 3. An immature immune system presents an increased risk of infection for infants and young children.
 - 4. Fluid resuscitation is unnecessary unless the burned area is more than 25% of the total body surface area.
 - 5. The lower proportion of body fluid to body mass in a child increases the risk of cardiovascular problems.
 - 6. Infants and young children are at increased risk for protein and calorie deficiency because they have smaller muscle mass and less body fat than adults.

ANSWERS

344. 3

Rationale: Parameters such as vital signs (especially heart rate), urinary output volume, adequacy of capillary filling, and state of sensorium determine adequacy of fluid resuscitation. Although options 1, 2, and 4 may provide some information related to fluid volume, in a burn injury, and from the options provided, adequacy of capillary filling is most accurate.

Test-Taking Strategy: Note the **strategic word**, most. Use the **ABCs—airway—breathing—circulation**—to assist in directing you to the correct option.

Review: **Fluid resuscitation** and **burn shock**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Pediatrics—Integumentary

Priority Concepts: Evidence; Fluid and Electrolyte Balance

Reference: Hockenberry, Wilson (2015), pp. 978-979.

345. 1

Rationale: Scabies is a parasitic skin disorder caused by an infestation of *Sarcoptes scabiei* (itch mite). Scabies appears as burrows or fine, grayish red, threadlike lines. They may be difficult to see if they are obscured by excoriation and inflammation. Purple-colored lesions may indicate various disorders, including systemic conditions. Thick, honey-colored crusts are characteristic of impetigo or secondary infection in eczema. Clusters of fluid-filled vesicles are seen in herpesvirus infection.

Test-Taking Strategy: Focus on the **subject**, clinical manifestations of scabies. Think about the characteristic of this parasitic skin disorder. Recalling that scabies infestation produces burrows will assist in directing you to the correct option.

Review: **Scabies**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Integumentary

Priority Concepts: Infection; Tissue Integrity

Reference: Hockenberry, Wilson (2015), pp. 232-233.

346. 4

Rationale: Permethrin is massaged thoroughly and gently into all skin surfaces (not just the areas that have the rash) from the head to the soles of the feet. Care should be taken to avoid contact with the eyes. The lotion should not be applied until at least 30 minutes after bathing and should be applied only to cool, dry skin. The lotion should be kept on for 8 to 14 hours, and then the child should be given a bath. The child should be clothed during the 8 to 14 hours of treatment contact time.

Test-Taking Strategy: Option 3 can be eliminated because the child should be clothed. Eliminate option 1 next because of the **closed-ended word**, only, in this option. From the remaining options, recalling the procedure for the application of this lotion will direct you to the correct option.

Review: **Permethrin**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity
 Integrated Process: Teaching and Learning
 Content Area: Pediatrics—Integumentary
 Priority Concepts: Client Education; Tissue Integrity
 References: Burchum, Rosenthal (2016) p. 1202.
 Hockenberry, Wilson (2015), pp. 232-233.

347. 3

Rationale: Impetigo is a contagious bacterial infection of the skin caused by β -hemolytic streptococci or staphylococci, or both. Impetigo is most common during hot, humid summer months. Impetigo may begin in an area of broken skin, such as an insect bite or atopic dermatitis. Impetigo is extremely contagious. Lesions usually are located around the mouth and nose, but may be present on the hands and extremities. Test-Taking Strategy: Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Think about the pathophysiology associated with impetigo. Knowledge regarding the cause and manifestations of impetigo will direct you to the correct option.

Review: **Impetigo**

Level of Cognitive Ability: Evaluating
 Client Needs: Safe and Effective Care Environment
 Integrated Process: Teaching and Learning
 Content Area: Pediatrics—Integumentary
 Priority Concepts: Client Education; Infection
 Reference: Hockenberry, Wilson (2015), p. 311.

348. 1

Rationale: Lindane is a pediculicide product that may be prescribed to treat scabies. It is contraindicated for children younger than 2 years because they have more permeable skin, and high systemic absorption may occur, placing the children at risk for central nervous system toxicity and seizures. Lindane also is used with caution in children between the ages of 2 and 10 years. Siblings and other household members should be treated simultaneously. Options 2 and 4 are unrelated to the use of lindane. Lindane is not recommended for use by a breast-feeding woman because the medication is secreted into breast milk.

Test-Taking Strategy: Focus on the **subject**, contraindications of lindane. Recall the concepts related to the body surface area of children and an 18-month-old, and medication administration. These concepts will direct you to the correct option.

Review: **Lindane**

Level of Cognitive Ability: Analyzing
 Client Needs: Safe and Effective Care Environment
 Integrated Process: Nursing Process—Analysis
 Content Area: Pediatrics—Integumentary
 Priority Concepts: Clinical Judgment; Safety
 Reference: Burchum, Rosenthal (2016), p. 1204.

349. 4

Rationale: Atopic dermatitis is a superficial inflammatory process involving primarily the epidermis. A topical corticosteroid may be prescribed and should be applied sparingly (thin layer) and rubbed into the area thoroughly. The affected area should be cleaned gently before application. A topical corticosteroid

should not be applied over extensive areas. Systemic absorption is more likely to occur with extensive application.

Test-Taking Strategy: Focus on the **subject**, application of a topical corticosteroid. Eliminate option 3 first because it does not make sense not to clean an affected area. Eliminate option 1 because medicated cream should be applied only to areas that are affected. Eliminate option 2 because of the word thick.

Review: **Topical corticosteroids**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Teaching and Learning
 Content Area: Pediatrics—Integumentary
 Priority Concepts: Client Education; Tissue Integrity
 Reference: Hockenberry, Wilson (2015), pp. 468, 614-615.

350. 4

Rationale: Pediculosis capitis is an infestation of the hair and scalp with lice. The nits are visible and attached firmly to the hair shaft near the scalp. The occiput is an area in which nits can be seen. Maculopapular lesions behind the ears or lesions that extend to the hairline or neck are indicative of an infectious process, not pediculosis. White flaky particles are indicative of dandruff.

Test-Taking Strategy: Focus on the **subject**, the characteristics of pediculosis capitis. Option 3 can be eliminated first because white flaky particles are indicative of dandruff. Recalling that in this infestation nit sacs attach to the hair shaft will direct you to the correct option.

Review: **Pediculosis capitis**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Pediatrics—Integumentary
 Priority Concepts: Clinical Judgment; Infection
 Reference: Hockenberry, Wilson (2015), pp. 233-234.

❖ 351. 2, 3, 6

Rationale: Pediatric considerations in the care of a burn victim include the following: Scarring is more severe in a child than in an adult. A delay in growth may occur after a burn injury. An immature immune system presents an increased risk of infection for infants and young children. The higher proportion of body fluid to body mass in a child increases the risk of cardiovascular problems. Burns involving more than 10% of total body surface area require some form of fluid resuscitation. Infants and young children are at increased risk for protein and calorie deficiencies because they have smaller muscle mass and less body fat than adults.

Test-Taking Strategy: Focus on the **subject**, pediatric considerations in the care of a child who has sustained a burn injury. To answer correctly, read each option carefully and think about the physiology of a child related to body size.

Review: **Burn injuries in the child**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Planning
 Content Area: Pediatrics—Integumentary
 Priority Concepts: Development; Tissue Integrity

Hematological Disorders

PRIORITY CONCEPTS Perfusion; Safety

CRITICAL THINKING What Should You Do?

A child with hemophilia who has been in a motor vehicle crash is admitted to the pediatric unit. What should the nurse do in the care of this child?

Answer located on p. 415.

I. Sickle Cell Anemia

A. Description

1. Sickle cell anemia constitutes a group of diseases termed hemoglobinopathies, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S.
2. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain.
3. Risk factors include having parents heterozygous for hemoglobin S or being of African American descent.
4. For screening purposes the sickle-turbidity test (Sickledex) is frequently used because it can be performed on blood from a fingerstick and yields accurate results in 3 minutes. However, if the test result is positive, hemoglobin (Hgb) electrophoresis is necessary to distinguish between children with the trait and those with the disease.
5. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell.
6. Insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow (Fig. 34-1).
7. The clinical manifestations occur primarily as a result of obstruction caused by sickled red blood cells and increased red blood cell destruction.
8. Situations that precipitate sickling include fever, dehydration, and emotional or physical stress;

any condition that increases the need for oxygen or alters the transport of oxygen can result in sickle cell crisis (acute exacerbation).

9. Sickle cell crises are acute exacerbations of the disease, which vary considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, hyperhemolytic crisis, and aplastic crisis.
 10. The sickling response is reversible under conditions of adequate oxygenation and hydration; after repeated sickling, the cell becomes permanently sickled.
 11. An interprofessional approach to care is needed, and care focuses on the prevention (preventing exposure to infection and maintaining normal hydration) and treatment (hydration, oxygen, pain management, and bed rest) of the crisis.
- B. Assessment of the crisis (Box 34-1)**
- C. Interventions**
1. Maintain adequate hydration and blood flow through oral and intravenously (IV) administered fluids. Electrolyte replacement is also provided as needed; without adequate hydration, pain will not be controlled.
 2. Administer oxygen and blood transfusions as prescribed to increase tissue perfusion; exchange transfusions, which reduce the number of circulating sickle cells and the risk of complications, may also be prescribed.
 3. Administer analgesics as prescribed (around the clock).
 4. Assist the child to assume a comfortable position so that the child keeps the extremities extended to promote venous return; elevate the head of the bed no more than 30 degrees, avoid putting strain on painful joints, and do not raise the knee gatch of the bed.
 5. Encourage consumption of a high-calorie, high-protein diet, with folic acid supplementation.
 6. Administer antibiotics as prescribed to prevent infection.

FIGURE 34-1 Differences between effects of (A) normal red blood cells and (B) sickled red blood cells on circulation, with related complications.

7. Monitor for signs of complications, including increasing anemia, decreased perfusion, and shock (mental status changes, pallor, vital sign changes).
8. Instruct the child and parents about the early signs and symptoms of crisis and the measures to prevent crisis.
9. Ensure that the child receives pneumococcal and meningococcal **vaccines** and an annual influenza vaccine because of susceptibility to infection secondary to functional asplenia.
10. A splenectomy may be necessary for clients who experience recurrent splenic sequestration.
11. Inform parents of the **hereditary** aspects of the disorder.

! Administration of meperidine for pain is avoided because of the risk of normeperidine-induced seizures.

BOX 34-1 Sickle Cell Crisis

Vaso-Occlusive Crisis

Caused by stasis of blood with clumping of cells in the micro-circulation, ischemia, and infarction

Manifestations: Fever; painful swelling of hands, feet, and joints; and abdominal pain

Splenic Sequestration

Caused by pooling and clumping of blood in the spleen (hypersplenism)

Manifestations: Profound anemia, hypovolemia, and shock

Hyperhemolytic Crisis

An accelerated rate of red blood cell destruction

Manifestations: Anemia, jaundice, and reticulocytosis

Aplastic Crisis

Caused by diminished production and increased destruction of red blood cells, triggered by viral infection or depletion of folic acid

Manifestations: Profound anemia and pallor

II. Iron Deficiency Anemia

A. Description

1. Iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells.
2. Commonly results from blood loss, increased metabolic demands, syndromes of gastrointestinal malabsorption, and dietary inadequacy.

B. Assessment

1. Pallor
2. Weakness and fatigue
3. Low hemoglobin and hematocrit levels
4. Red blood cells that are microcytic and hypochromic

C. Interventions

1. Increase oral intake of iron; iron-fortified formula is needed for an infant.

BOX 34-2 Iron-Rich Foods

- | | |
|---|----------------|
| ▪ Breads and cereals | ▪ Meats |
| ▪ Dark green, leafy vegetables | ▪ Molasses |
| ▪ Dried fruits | ▪ Nuts |
| ▪ Egg yolks | ▪ Potatoes |
| ▪ Iron-enriched infant formula and cereal | ▪ Prune juice |
| ▪ Kidney beans | ▪ Raisins |
| ▪ Legumes | ▪ Seeds |
| ▪ Liver | ▪ Shellfish |
| | ▪ Tofu |
| | ▪ Whole grains |

2. Instruct the child and parents in food choices that are high in iron (Box 34-2).
3. Administer iron supplements as prescribed.
4. Intramuscular injections of iron (using Z-track method) or IV administration of iron may be prescribed in severe cases of anemia.
5. Teach parents how to administer the iron supplements.
 - a. Give between meals for maximum absorption.
 - b. Give with a multivitamin or fruit juice because vitamin C increases absorption.
 - c. Do not give with milk or antacids because these items decrease absorption.
6. Instruct the child and parents about the side effects of iron supplements (black stools, constipation, and foul aftertaste).

 **Liquid iron preparation stains the teeth. Teach the parents and child that liquid iron should be taken through a straw and that the teeth should be brushed after administration.**

III. Aplastic Anemia**A. Description**

1. Aplastic anemia is a deficiency of circulating erythrocytes and all other formed elements of blood, resulting from the arrested development of cells within the bone marrow.
2. It can be primary (present at birth) or secondary (acquired).
3. Several possible causes exist, including chronic exposure to myelotoxic agents, viruses, infection, autoimmune disorders, and allergic states.
4. The definitive diagnosis is determined by bone marrow aspiration (shows conversion of red bone marrow to fatty bone marrow).
5. Therapeutic management focuses on restoring function to the bone marrow and involves immunosuppressive therapy and bone marrow transplantation (treatment of choice if a suitable donor exists).

6. If the cause is a myelotoxic medication that is being administered for another purpose, the medication may be discontinued to improve bone marrow function.

B. Assessment

1. Pancytopenia (deficiency of erythrocytes, leukocytes, and thrombocytes)
2. Petechiae, purpura, bleeding, pallor, weakness, tachycardia, and fatigue

C. Interventions

1. Prepare the child for bone marrow transplantation if planned.
2. Administer immunosuppressive medications as prescribed; anti-lymphocyte globulin or anti-thymocyte globulin may be prescribed to suppress the autoimmune response.
3. Colony-stimulating factors may be prescribed to enhance bone marrow production.
4. Corticosteroids and cyclosporine may be prescribed.
5. Administer blood transfusions if prescribed and monitor for transfusion reactions.

IV. Hemophilia**A. Description**

1. Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins.
2. Identifying the specific coagulation deficiency is important so that definitive treatment with the specific replacement agent can be implemented; aggressive replacement therapy is initiated to prevent the chronic crippling effects from joint bleeding.
3. The most common types are factor VIII deficiency (hemophilia A or classic hemophilia) and factor IX deficiency (hemophilia B or Christmas disease).
4. Hemophilia is transmitted as an X-linked recessive disorder (it may also occur as a result of a gene mutation).
5. Carrier females pass on the defect to affected males; female offspring are rarely born with the disorder, but may be if they inherit an affected gene from their mother and are offspring of a father with hemophilia.
6. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain or corticosteroids, may be prescribed depending on the source of bleeding from the disorder.

B. Assessment

1. Abnormal bleeding in response to trauma or surgery (sometimes is detected after circumcision)
2. Epistaxis (nosebleeds)
3. Joint bleeding causing pain, tenderness, swelling, and limited range of motion
4. Tendency to bruise easily

- Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal.

C. Interventions

- Monitor for bleeding and maintain bleeding precautions.
- Prepare to administer factor VIII concentrates, either produced through genetic engineering (recombinant) or derived from pooled plasma, as prescribed.
- DDAVP (1-deamino-8-D-arginine vasopressin), a synthetic form of vasopressin, increases plasma factor VIII and may be prescribed to treat mild hemophilia.
- Monitor for joint pain; immobilize the affected extremity if joint pain occurs.
- Assess neurological status (child is at risk for intracranial hemorrhage).
- Monitor urine for hematuria.
- Control joint bleeding by immobilization, elevation, and application of ice; apply pressure (15 minutes) for superficial bleeding.
- Instruct the child and parents about the signs of internal bleeding.
- Instruct parents in how to control the bleeding.
- Instruct parents regarding activities for the child, emphasizing the avoidance of contact sports and the need for protective devices while learning to walk; assist in developing an appropriate exercise plan.
- Instruct the child to wear protective devices such as helmets and knee and elbow pads when participating in sports such as bicycling and skating.

V. von Willebrand's Disease

A. Description

- von Willebrand's disease is a **hereditary** bleeding disorder that is characterized by a deficiency of or a defect in a protein termed von Willebrand factor.
- The disorder causes platelets to adhere to damaged endothelium; the von Willebrand factor protein also serves as a carrier protein for factor VIII.
- It is characterized by an increased tendency to bleed from mucous membranes.

B. Assessment

- Epistaxis
- Gum bleeding
- Easy bruising
- Excessive menstrual bleeding

C. Interventions

- Treatment and care are similar to measures implemented for hemophilia, including administration of clotting factors.
- Provide emotional support to the child and parents, especially if the child is experiencing an episode of bleeding.

 A child with a bleeding disorder needs to wear a MedicAlert bracelet.

VI. β -Thalassemia Major

A. Description (Box 34-3)

- β -Thalassemia major is an autosomal recessive disorder characterized by the reduced production of 1 of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β -thalassemia major).
- The incidence is highest in individuals of Mediterranean descent, such as Italians, Greeks, Syrians, and their offspring.
- Treatment is supportive; the goal of therapy is to maintain normal hemoglobin levels by the administration of blood transfusions.
- Bone marrow transplantation may be offered as an alternative therapy.
- A splenectomy may be performed in a child with severe splenomegaly who requires repeated transfusions (assists in relieving abdominal pressure and may increase the life span of supplemental red blood cells).

B. Assessment

- Frontal bossing
- Maxillary prominence
- Wide-set eyes with a flattened nose
- Greenish yellow skin tone
- Hepatosplenomegaly
- Severe anemia
- Microcytic, hypochromic red blood cells

C. Interventions

- Administer blood transfusions as prescribed; monitor for transfusion reactions.
- Monitor for iron overload; chelation therapy with deferasirox or deferoxamine may be prescribed to treat iron overload and to prevent organ damage from the elevated levels of iron caused by the multiple transfusion therapy.
- If the child has had a splenectomy, instruct parents to report any signs of infection because of the risk of sepsis.
- Ensure that parents understand the importance of the child receiving pneumococcal and meningococcal vaccines in addition to an annual influenza vaccine and the regularly scheduled vaccines.
- Provide genetic counseling to parents.

BOX 34-3 Types of β -Thalassemia

Thalassemia Minor: Asymptomatic silent carrier case

Thalassemia Trait: Produces mild microcytic anemia

Thalassemia Intermedia: Manifested as splenomegaly and moderate to severe anemia

Thalassemia Major: Results in severe anemia requiring transfusion support to sustain life (also known as Cooley's anemia)

CRITICAL THINKING What Should You Do?

Answer: The child with hemophilia is at risk for bleeding. If the child experienced recent trauma, the nurse should place the child on bleeding precautions and monitor for bleeding. This is the priority intervention. The nurse should monitor vital signs and monitor for joint pain. Joint bleeding should be controlled by immobilization, elevation, and application of ice. Pressure should be applied for 15 minutes for any superficial bleeding. The neurological status should be checked because the child is at risk for intracranial hemorrhage, and the nurse should monitor the urine for hematuria. Blood replacement factors may be prescribed.

Reference: Hockenberry, Wilson (2015), pp. 1360-1361.

PRACTICE QUESTIONS

352. The nurse analyzes the laboratory results of a child with hemophilia. The nurse understands that which result will most likely be abnormal in this child?
1. Platelet count
 2. Hematocrit level
 3. Hemoglobin level
 4. Partial thromboplastin time
353. The nurse is providing home care instructions to the parents of a 10-year-old child with hemophilia. Which sport activity should the nurse suggest for this child?
1. Soccer
 2. Basketball
 3. Swimming
 4. Field hockey
354. The nursing student is presenting a clinical conference and discusses the cause of β -thalassemia. The nursing student informs the group that a child at greatest risk of developing this disorder is which of these?
1. A child of Mexican descent
 2. A child of Mediterranean descent
 3. A child whose intake of iron is extremely poor
 4. A breast-fed child of a mother with chronic anemia
355. A child with β -thalassemia is receiving long-term blood transfusion therapy for the treatment of the disorder. Chelation therapy is prescribed as a result of too much iron from the transfusions. Which medication should the nurse anticipate to be prescribed?
1. Fragmin
 2. Meropenem
 3. Metoprolol
 4. Deferoxamine
356. The clinic nurse instructs parents of a child with sickle cell anemia about the precipitating factors related to sickle cell crisis. Which, if identified by the parents as a precipitating factor, indicates the need for further instruction?
1. Stress
 2. Trauma
 3. Infection
 4. Fluid overload
357. A 10-year-old child with hemophilia A has slipped on the ice and bumped his knee. The nurse should prepare to administer which prescription?
1. Injection of factor X
 2. Intravenous infusion of iron
 3. Intravenous infusion of factor VIII
 4. Intramuscular injection of iron using the Z-track method
358. The nurse is instructing the parents of a child with iron deficiency anemia regarding the administration of a liquid oral iron supplement. Which instruction should the nurse tell the parents?
1. Administer the iron at mealtimes.
 2. Administer the iron through a straw.
 3. Mix the iron with cereal to administer.
 4. Add the iron to formula for easy administration.
359. Laboratory studies are performed for a child suspected to have iron deficiency anemia. The nurse reviews the laboratory results, knowing that which result indicates this type of anemia?
1. Elevated hemoglobin level
 2. Decreased reticulocyte count
 3. Elevated red blood cell count
 4. Red blood cells that are microcytic and hypochromic
- ❖ 360. The nurse is reviewing a health care provider's prescriptions for a child with sickle cell anemia who was admitted to the hospital for the treatment of vaso-occlusive crisis. Which prescriptions documented in the child's record should the nurse question? Select all that apply.
- 1. Restrict fluid intake.
 - 2. Position for comfort.
 - 3. Avoid strain on painful joints.
 - 4. Apply nasal oxygen at 2 L/minute.
 - 5. Provide a high-calorie, high-protein diet.
 - 6. Give meperidine, 25 mg intravenously, every 4 hours for pain.

- ❖ 361. The nurse is conducting staff in-service training on von Willebrand's disease. Which should the nurse include as characteristics of von Willebrand's disease? Select all that apply.
- 1. Easy bruising occurs.
 - 2. Gum bleeding occurs.
 - 3. It is a hereditary bleeding disorder.
 - 4. Treatment and care are similar to that for hemophilia.
 - 5. It is characterized by extremely high creatinine levels.
 - 6. The disorder causes platelets to adhere to damaged endothelium.

ANSWERS

352. 4

Rationale: Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Results of tests that measure platelet function are normal; results of tests that measure clotting factor function may be abnormal. Abnormal laboratory results in hemophilia indicate a prolonged partial thromboplastin time. The platelet count, hemoglobin level, and hematocrit level are normal in hemophilia.

Test-Taking Strategy: Focus on the **subject**, laboratory tests used to monitor hemophilia, and note the **strategic words**, most likely. Recalling the pathophysiology associated with this disorder and recalling that it results from a deficiency of specific coagulation proteins will direct you to the correct option.

Review: Laboratory tests used to monitor **hemophilia**

353. 3

Rationale: Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. Children with hemophilia need to avoid contact sports and to take precautions such as wearing elbow and knee pads and helmets with other sports. The safe activity for them is swimming.

Test-Taking Strategy: Focus on the **subject**, a safe activity. Recalling that bleeding is a major concern in this condition, eliminate options 1, 2, and 4 because these activities are **comparable or alike** in that they present the potential for injury.

Review: Home care and safety instructions for **hemophilia**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Pediatrics—Hematological

Priority Concepts: Clotting; Safety

Reference: Hockenberry, Wilson (2015), p. 1360.

354. 2

Rationale: β -Thalassemia is an autosomal recessive disorder characterized by the reduced production of 1 of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β -thalassemia major). This

disorder is found primarily in individuals of Mediterranean descent. Options 1, 3, and 4 are incorrect.

Test-Taking Strategy: Focus on the **subject**, the child at greatest risk for β -thalassemia major. Think about the pathophysiology of the disorder. Remember that this disorder occurs primarily in individuals of Mediterranean descent.

Review: **β -Thalassemia**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Pediatrics—Hematological

Priority Concepts: Gas Exchange; Perfusion

Reference: Hockenberry, Wilson (2015), p. 1349.

355. 4

Rationale: β -Thalassemia is an autosomal recessive disorder characterized by the reduced production of 1 of the globin chains in the synthesis of hemoglobin (both parents must be carriers to produce a child with β -thalassemia major). The major complication of long-term transfusion therapy is hemosiderosis. To prevent organ damage from too much iron, chelation therapy with either Exjade or deferoxamine may be prescribed. Deferoxamine is classified as an antidote for acute iron toxicity. Fragmin is an anticoagulant used as prophylaxis for postoperative deep vein thrombosis. Meropenem is an antibiotic. Metoprolol is a beta blocker used to treat hypertension. Test-Taking Strategy: Focus on the **subject**, chelation therapy. Specific knowledge regarding the antidote for iron toxicity is needed to answer this question. One way to remember this is to look at the prefix in the generic name of the medication used to treat iron overdose. Remember to associate defer- and removal of iron.

Review: **Chelation therapy**

Content Area: Pediatrics—Hematological

Priority Concepts: Clinical Judgment; Gas Exchange

Reference: Hockenberry, Wilson (2015), pp. 1352-1353.

356. 4

Rationale: Sickle cell crises are acute exacerbations of the disease, which vary considerably in severity and frequency; these include vaso-occlusive crisis, splenic sequestration, hyperhemolytic crisis, and aplastic crisis. Sickle cell crisis may be precipitated by infection, dehydration, hypoxia, trauma, or physical or emotional stress. The mother of a child with sickle

cell disease should encourage fluid intake of 1½ to 2 times the daily requirement to prevent dehydration.

Test-Taking Strategy: Note the **strategic words**, need for further instruction. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Recalling that fluids are a main component of treatment in sickle cell anemia to prevent crisis will direct you to the correct option. Remember that fluids are required to prevent dehydration.

Review: Precipitating factors of **sickle cell crisis**

Level of Cognitive Ability: Evaluating

357. 3

Rationale: Hemophilia refers to a group of bleeding disorders resulting from a deficiency of specific coagulation proteins. The primary treatment is replacement of the missing clotting factor; additional medications, such as agents to relieve pain, may be prescribed depending on the source of bleeding from the disorder. A child with hemophilia A is at risk for joint bleeding after a fall. Factor VIII would be prescribed intravenously to replace the missing clotting factor and minimize the bleeding. Factor X and iron are not used to treat children with hemophilia A.

Test-Taking Strategy: Focus on the child's diagnosis. Eliminate options 2 and 4 because they are **comparable or alike**. Recalling that a child with hemophilia A is missing clotting factor VIII will direct you to the correct option from those remaining.

Review: **Hemophilia A**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Priority Concepts: Clinical Judgment; Clotting

Reference: Hockenberry, Wilson (2015), p. 1357.

358. 2

Rationale: In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. An oral iron supplement should be administered through a straw or medicine dropper placed at the back of the mouth because the iron stains the teeth. The parents should be instructed to brush or wipe the child's teeth or have the child brush the teeth after administration. Iron is administered between meals because absorption is decreased if there is food in the stomach. Iron requires an acid environment to facilitate its absorption in the duodenum. Iron is not added to formula or mixed with cereal or other food items.

Test-Taking Strategy: Eliminate options 3 and 4 first because they are **comparable or alike** and because medication should not be added to formula and food. Next, note the word liquid in the question. This should assist you in recalling that iron in liquid form stains teeth.

Review: Administration of oral liquid **iron**

Level of Cognitive Ability: Applying

359. 4

Rationale: In iron deficiency anemia, iron stores are depleted, resulting in a decreased supply of iron for the manufacture of hemoglobin in red blood cells. The results of a complete blood cell count in children with iron deficiency anemia show decreased hemoglobin levels and microcytic and hypochromic red blood cells. The red blood cell count is decreased. The reticulocyte count is usually normal or slightly elevated.

Test-Taking Strategy: Focus on the **subject**, laboratory findings. Eliminate options 1 and 3 first, knowing that the hemoglobin and red blood cell counts would be decreased. From the remaining options, select the correct option over option 2 because of the relationship between anemia and red blood cells.

Review: Laboratory findings associated with **iron deficiency anemia**

❖ 360. 1, 6

Rationale: Sickle cell anemia is one of a group of diseases termed hemoglobinopathies, in which hemoglobin A is partly or completely replaced by abnormal sickle hemoglobin S. It is caused by the inheritance of a gene for a structurally abnormal portion of the hemoglobin chain. Hemoglobin S is sensitive to changes in the oxygen content of the red blood cell; insufficient oxygen causes the cells to assume a sickle shape, and the cells become rigid and clumped together, obstructing capillary blood flow. Oral and intravenous fluids are an important part of treatment. Meperidine is not recommended for a child with sickle cell disease because of the risk for normeperidine-induced seizures. Normeperidine, a metabolite of meperidine, is a central nervous system stimulant that produces anxiety, tremors, myoclonus, and generalized seizures when it accumulates with repetitive dosing. The nurse would question the prescription for restricted fluids and meperidine for pain control. Positioning for comfort, avoiding strain on painful joints, oxygen, and a high-calorie and high-protein diet are also important parts of the treatment plan.

Test-Taking Strategy: Focus on the **subject**, identifying the prescriptions that need to be questioned and on the pathophysiology that occurs in sickle cell disease. Recalling that fluids are an important component of the treatment plan will assist in identifying that a fluid restriction prescription would need to be questioned. Also, recalling the effects of meperidine

will assist in identifying that this prescription needs to be questioned.

❖ 361. 1, 2, 3, 4, 6

Rationale: von Willebrand's disease is a hereditary bleeding disorder characterized by a deficiency of or a defect in a protein termed von Willebrand factor. The disorder causes platelets to adhere to damaged endothelium. It is characterized by an

increased tendency to bleed from mucous membranes. Assessment findings include epistaxis, gum bleeding, easy bruising, and excessive menstrual bleeding. An elevated creatinine level is not associated with this disorder.

Test-Taking Strategy: Focus on the **subject**, assessment findings, and on the child's diagnosis. Recalling that this disorder is characterized by an increased tendency to bleed from mucous membranes will direct you to the correct options.

Review: **von Willebrand's disease**

Oncological Disorders

PRIORITY CONCEPTS Cellular Regulation; Safety

CRITICAL THINKING What Should You Do?

The nurse caring for a child with a diagnosis of leukemia receives a report from the laboratory indicating that the white blood cell count is 2000 mm^3 ($2.0 \times 10^9/\text{L}$) and the absolute neutrophil count is 40% (0.40). What should the nurse do? Answer located on p. 425.

I. Leukemia

A. Description

1. Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow.
2. In leukemia, proliferating immature white blood cells (WBCs) depress the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia).
3. The cause is unknown; it seems to involve genetic damage of cells, leading to the transformation of cells from a normal state to a malignant state.
4. Risk factors include genetic, viral, immunological, and environmental factors and exposure to radiation, chemicals, and medications.
5. Acute lymphocytic leukemia is the most frequent type of cancer in children.
6. Leukemia is more common in boys than girls after 1 year of age.
7. Prognosis depends on various factors such as age at diagnosis, initial WBC count, type of cell involved, and sex of the child.
8. Treatment involves chemotherapy and possibly radiation and hematopoietic stem cell transplantation.
9. The phases of chemotherapy include induction, which achieves a complete remission or disappearance of leukemic cells; intensification or consolidation therapy, which decreases the

tumor burden further; central nervous system prophylactic therapy, which prevents leukemic cells from invading the central nervous system; and maintenance, which serves to maintain the remission phase.

B. Assessment

1. Infiltration of the bone marrow by malignant cells causes fever, pallor, fatigue, anorexia, hemorrhage (usually petechiae), and bone and joint pain; pathological fractures can occur as a result of bone marrow invasion with leukemic cells.
2. Signs of infection occur as a result of neutropenia.
3. The child experiences hepatosplenomegaly and lymphadenopathy.
4. The child has a normal, elevated, or low WBC count, depending on the presence of infection or of immature versus mature WBCs.
5. The child has decreased hemoglobin and hematocrit levels.
6. The child has a decreased platelet count.
7. A positive bone marrow biopsy specimen identifies leukemic blast (immature)–phase cells.
8. Signs of increased intracranial pressure (ICP) occur as a result of central nervous system involvement (**Box 35-1**).
9. The child shows signs of cranial nerve (cranial nerve VII, or the facial nerve, is most commonly affected) or spinal nerve involvement; clinical manifestations relate to the area involved.
10. Clinical manifestations indicate the invasion of leukemic cells to the kidneys, testes, prostate, ovaries, gastrointestinal tract, and lungs.

C. Infection (**Box 35-2**)

1. Infection can occur through self-contamination or cross-contamination.
2. The most common sites for infection are the skin (any break in the skin is a potential site of infection), respiratory tract, and gastrointestinal tract.

BOX 35-1 Manifestations of Increased Intracranial Pressure in Infants and Children**Infants**

- Tense, bulging fontanel
- Separated cranial sutures
- Macewen's sign (cracked-pot sound on percussion)
- Irritability
- High-pitched cry
- Increased head circumference
- Distended scalp veins
- Poor feeding
- Crying when disturbed
- Setting sun sign (eyes appear to look only downward, with the sclera prominent over the iris)

Children

- Headache
- Nausea
- Forceful vomiting
- Diplopia; blurred vision
- Seizures

Personality and Behavior Signs

- Irritability, restlessness
- Indifference, drowsiness
- Decline in school performance
- Diminished physical activity and motor performance
- Increased sleeping
- Inability to follow simple commands
- Lethargy

Late Signs

- Bradycardia
- Decreased motor response to command
- Decreased sensory response to painful stimuli
- Alterations in pupil size and reaction
- Decerebrate (extension) or decorticate (flexion) posturing
- Cheyne-Stokes respirations
- Papilledema
- Decreased consciousness
- Coma

From Perry S, Hockenberry M, Lowdermilk D, Wilson D: Maternal-child nursing care, ed 4, St. Louis, 2010, Mosby.

BOX 35-2 Protecting the Child from Infection

Initiate protective isolation procedures.

Maintain frequent and thorough hand washing.

Maintain the child in a private room with high-efficiency particulate air filtration or laminar air flow system if possible.

Ensure that the child's room is cleaned daily.

Use strict aseptic technique for all nursing procedures.

Limit the number of caregivers entering the child's room, and ensure that anyone entering the child's room wears a mask.

Keep supplies for the child separate from supplies for other children.

Reduce exposure to environmental organisms by eliminating raw fruits and vegetables from the diet, by not allowing fresh flowers in the child's room, and by not leaving standing water in the child's room.

Assist the child with daily bathing, using antimicrobial soap.

Assist the child to perform oral hygiene frequently.

Assess for signs and symptoms of infection.

Monitor temperature, pulse, and blood pressure.

Change wound dressings daily, and inspect wounds for redness, swelling, or drainage.

Assess urine for color and cloudiness.

Assess the skin and oral mucous membranes for signs of infection.

Auscultate lung sounds.

Encourage the child to cough and deep-breathe.

Monitor white blood cell and neutrophil counts.

Notify the health care provider if signs of infection are present, and prepare to obtain specimens for culture of open lesions, urine, and sputum.

Initiate a bowel program to prevent constipation and rectal trauma.

Avoid invasive procedures such as injections, rectal temperatures, and urinary catheterization.

Administer antibiotic, antifungal, and antiviral medications as prescribed.

Administer granulocyte colony-stimulating factor as prescribed. Instruct parents to keep the child away from crowds and individuals with infections.

Instruct parents that the child should not receive immunization with a live virus (measles, mumps, rubella, polio) because if the immune system is depressed, the attenuated virus can result in a life-threatening infection; also, the child should not receive the varicella vaccine.

The Salk (inactivated) vaccine for poliomyelitis may be administered.

Instruct parents to inform the teacher that they should be notified immediately if a case of a communicable disease occurs in another child at school.

D. Bleeding (Box 35-3)

1. Platelet transfusions are generally reserved for active bleeding episodes that do not respond to local treatment and that may occur during induction or relapse therapy.
2. Packed red blood cells may be prescribed for a child with severe blood loss.

E. Fatigue and nutrition

1. Assist the parents and child in selecting a well-balanced diet.
2. Provide small meals that require little chewing and are not irritating to the oral mucosa.
3. If the child cannot take oral feedings, parenteral nutrition or enteral feedings may be prescribed.

BOX 35-3 Protecting the Child from Bleeding

Examine the child for signs and symptoms of bleeding.
 Handle the child gently.
 Measure abdominal girth; an increase can indicate internal hemorrhage.
 Instruct the child to use a soft toothbrush and avoid dental floss.
 Provide soft foods that are cool to warm in temperature.
 Avoid injections, if possible, to prevent trauma to the skin and bleeding.
 Apply firm and gentle pressure to a needle-stick site for at least 10 minutes.
 Pad side rails and sharp corners of the bed and furniture.
 Discourage the child from engaging in activities involving the use of objects that can be harmful.

Instruct the child to avoid constrictive or tight clothing.
 Use caution when taking the blood pressure to prevent skin injury.
 Instruct the child to avoid blowing his or her nose.
 Avoid the use of rectal suppositories, enemas, and rectal thermometers.
 Examine all body fluids and excrement for the presence of blood.
 Count the number of pads or tampons used if the adolescent girl is menstruating.
 Instruct the child about the signs and symptoms of bleeding.
 Instruct parents to avoid administering nonsteroidal antiinflammatory drugs and products that contain aspirin to the child.

4. Assist the child in self-care and mobility activities.
5. Allow adequate rest periods during care.
6. Do not perform nursing care activities unless they are essential.

F. Chemotherapy

1. Monitor for severe bone marrow suppression; during the period of greatest bone marrow suppression (the nadir), blood cell counts are extremely low.
2. Monitor for infection and bleeding.
3. Protect the child from life-threatening infections.
4. Monitor for nausea, vomiting, and alteration in bowel function.
5. Administer stool softeners as prescribed and if needed to prevent straining if constipation occurs.
6. Provide rectal hygiene gently as needed.
7. Administer antiemetics before beginning chemotherapy as prescribed.
8. Monitor for signs of dehydration.
9. Monitor for signs of hemorrhagic cystitis.
10. Monitor for signs of peripheral neuropathy.
11. Assess oral mucous membranes for mucositis; administer frequent mouth rinses per agency procedure and as prescribed to promote healing or prevent infection (local oral anesthetics may also be prescribed).
12. Instruct the parents and child in the signs and symptoms to watch for after chemotherapy and when to notify the health care provider (HCP).
13. Inform the parents and child that hair loss may occur from chemotherapy (hair regrows in about 3 to 6 months and may be a slightly different color or texture).
14. Instruct the parents and child about the care of a central venous access device, as necessary (see [Chapter 13](#)).
15. Listen to the child and family, and encourage them to verbalize their feelings and express their concerns.

16. Introduce the family to other families of children with cancer.
17. Consult social services and chaplains as necessary.

! Monitor a child receiving chemotherapy closely for signs of infection. Infection is a major cause of death in the immunosuppressed child.

II. Hodgkin's Disease**A. Description**

1. Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes that originates in a single lymph node or a single chain of nodes ([Fig. 35-1](#)).

FIGURE 35-1 Main areas of lymphadenopathy and organ involvement in Hodgkin's disease.

2. The disease predictably metastasizes to nonnodal or extralymphatic sites, especially the spleen, liver, bone marrow, lungs, and mediastinum.
3. Hodgkin's disease is characterized by the presence of Reed-Sternberg cells noted in a lymph node biopsy specimen.
4. Peak incidence is in mid-adolescence.
5. Possible causes include viral infections and previous exposure to alkylating chemical agents.
6. The prognosis is excellent, with long-term survival rates depending on the stage of the disease.
7. The primary treatment modalities are radiation and chemotherapy; each may be used alone or in combination, depending on the clinical stage of the disease.

B. Assessment

1. Painless enlargement of lymph nodes
2. Enlarged, firm, nontender, movable nodes in the supraclavicular area; in children, the "sentinel" node located near the left clavicle may be the first enlarged node
3. Nonproductive cough as a result of mediastinal lymphadenopathy
4. Abdominal pain as a result of enlarged retroperitoneal nodes
5. Advanced lymph node and extralymphatic involvement that may cause systemic symptoms, such as a low-grade or intermittent fever, anorexia, nausea, weight loss, night sweats, and pruritus
6. Positive biopsy specimen of a lymph node (presence of Reed-Sternberg cells) and positive bone marrow biopsy specimen
7. Computed tomography scan of the liver, spleen, and bone marrow may be done to detect metastasis.

C. Interventions

1. For early stages without mediastinal node involvement, the treatment of choice is extensive external radiation of the involved lymph node regions.
2. With more extensive disease, radiation and multidrug chemotherapy are used.
3. Monitor for medication-induced pancytopenia and an abnormal depression of all cellular components of the blood, which increases the risk for infection, bleeding, and anemia.
4. Monitor for signs of infection and bleeding.
5. Protect the child from infection.
6. Monitor for adverse effects related to chemotherapy or radiation; the most common adverse effect of extensive irradiation is malaise, which can be difficult for older children and adolescents to tolerate physically and psychologically (Table 35-1).
7. Monitor for nausea and vomiting, and administer antiemetics as prescribed.

TABLE 35-1 Adverse Effects of Radiation Therapy and Nursing Interventions

Body Area and Adverse Effects	Interventions
Gastrointestinal Tract Anorexia	Encourage fluids and foods as best tolerated
	Provide small, frequent meals
	Monitor for weight loss
Nausea, vomiting	Administer antiemetics around the clock
	Monitor for dehydration
Mucosal ulceration	Provide soothing oral hygiene and prescribed mouth rinses
	Topical anesthetic may be prescribed
Diarrhea	Administer antispasmodics and antidiarrheal preparations as prescribed
	Monitor for dehydration
Skin Alopecia (hair loss)	Introduce idea of a wig or head wraps to child
	Provide scalp hygiene
	Stress the need for head covering in cold weather
	For dryness, apply lubricant as prescribed
Urinary Bladder Cystitis	Keep skin clean
	Wash skin daily, using a mild soap sparingly
	Do not remove skin markings for radiation
	Avoid exposure to the sun and other extreme temperature changes
Bone Marrow Myelosuppression	Encourage fluid intake and frequent voiding
	Monitor for hematuria
	Administer antibiotics as prescribed
	Avoid use of suppositories, enemas, and rectal temperatures
	Institute neutropenic or bleeding precautions as needed
	Monitor for signs of anemia

Adapted from Hockenberry M, Wilson D: Wong's nursing care of infants and children, ed 9, St. Louis, 2013, Mosby; and McKinney E, James S, Murray S, Ashwill J: Maternal-child nursing, ed 4, St. Louis, 2013, Saunders.

III. Nephroblastoma (Wilms' Tumor)

A. Description

1. Wilms' tumor is the most common intraabdominal and kidney tumor of childhood; it may manifest unilaterally and localized or bilaterally, sometimes with metastasis to other organs.

2. The peak incidence is 3 years of age.
3. Occurrence is associated with a genetic inheritance and with several congenital anomalies.
4. Therapeutic management includes a combined treatment of surgery (partial to total nephrectomy) and chemotherapy with or without radiation, depending on the clinical stage and the histological pattern of the tumor.

B. Assessment

1. Swelling or mass within the abdomen (mass is characteristically firm, nontender, confined to 1 side, and deep within the flank)
2. Urinary retention or hematuria, or both
3. Anemia (caused by hemorrhage within the tumor)
4. Pallor, anorexia, and lethargy (resulting from anemia)
5. Hypertension (caused by secretion of excess amounts of renin by the tumor)
6. Weight loss and fever
7. Symptoms of lung involvement, such as dyspnea, shortness of breath, and pain in the chest, if metastasis has occurred

C. Preoperative interventions

1. Monitor vital signs, particularly blood pressure.
2. Avoid palpation of the abdomen; place a sign at bedside that reads, Do Not Palpate Abdomen.
3. Measure abdominal girth at least once daily.

D. Postoperative interventions

1. Monitor temperature and blood pressure closely.
2. Monitor for signs of hemorrhage and infection.
3. Monitor strict intake and urine output closely.
4. Monitor for abdominal distention; monitor bowel sounds and other signs of gastrointestinal activity because of the risk for intestinal obstruction.

 **Avoid palpation of the abdomen in a child with Wilms' tumor and be cautious when bathing, moving, or handling the child. It is important to keep the encapsulated tumor intact. Rupture of the tumor can cause the cancer cells to spread throughout the abdomen, lymph system, and bloodstream.**

IV. Neuroblastoma

A. Description

1. Neuroblastoma is a tumor that originates from the embryonic neural crest cells that normally give rise to the adrenal medulla and the sympathetic ganglia.
2. Most tumors develop in the adrenal gland or the retroperitoneal sympathetic chain; other sites may be within the head, neck, chest, or pelvis.
3. Most children present with neuroblastoma before 10 years of age.
4. Most presenting signs are caused by the tumor compressing adjacent normal tissue and organs.

5. Diagnostic evaluation is aimed at locating the primary site of the tumor; analyzing the breakdown products excreted in the urine, namely vanillylmandelic acid, homovanillic acid, dopamine, and norepinephrine, permits detection of suspected tumor before and after medical-surgical intervention.
6. The prognosis is poor because of the frequency of invasiveness of the tumor and because, in most cases, a diagnosis is not made until after metastasis has occurred; the younger the child at diagnosis, the better the survival rate.
7. Therapeutic management
 - a. Surgery is performed to remove as much of the tumor as possible and to obtain biopsy specimens; in the early stages, complete surgical removal of the tumor is the treatment of choice.
 - b. Surgery usually is limited to biopsy in the later stages because of extensive metastasis.
 - c. Radiation is used commonly with later-stage disease and provides palliation for metastatic lesions in bones, lungs, liver, and brain.
 - d. Chemotherapy is used for extensive local or disseminated disease.

B. Assessment

1. Firm, nontender, irregular mass in the abdomen that crosses the midline
2. Urinary frequency or retention from compression of the kidney, ureter, or bladder
3. Lymphadenopathy, especially in the cervical and supraclavicular areas
4. Bone pain if skeletal involvement
5. Supraorbital ecchymosis, periorbital edema, and exophthalmos as a result of invasion of retrobulbar soft tissue
6. Pallor, weakness, irritability, anorexia, weight loss
7. Signs of respiratory impairment (thoracic lesion)
8. Signs of neurological impairment (intracranial lesion)
9. Paralysis from compression of the spinal cord

C. Preoperative interventions

1. Monitor for signs and symptoms related to the location of the tumor.
2. Provide emotional support to the child and parents.

D. Postoperative interventions

1. Monitor for postoperative complications related to the location (organ) of the surgery.
2. Monitor for complications related to chemotherapy or radiation if prescribed.
3. Provide support to the parents and encourage them to express their feelings; many parents feel guilt for not having recognized signs in the child earlier.
4. Refer parents to appropriate community services.

V. Osteosarcoma (Osteogenic Sarcoma)

A. Description

1. The most common bone cancer in children; it is also known as osteogenic sarcoma.
2. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur.
3. The peak age of incidence is between 10 and 25 years.
4. Symptoms in the earliest stage are almost always attributed to extremity injury or normal growing pains.
5. Treatment may include surgical resection (limb salvage procedure) to save a limb or remove affected tissue, or amputation.
6. Chemotherapy is used to treat the cancer and may be used before and after surgery.

B. Assessment

1. Localized pain at the affected site (may be severe or dull) that may be attributed to trauma or the vague complaint of “growing pains”; pain often is relieved by a flexed position.
2. Palpable mass
3. Limping if weight-bearing limb is affected
4. Progressive limited range of motion and the child’s curtailing of physical activity
5. Child may be unable to hold heavy objects because of their weight and resultant pain in the affected extremity.
6. Pathological fractures occur at the tumor site.

C. Interventions

1. Prepare the child and family for prescribed treatment modalities, which may include surgical resection by limb salvage to remove affected tissue, amputation, and chemotherapy.
2. Communicate honestly with the child and family and provide support.
3. Prepare for prosthetic fitting as necessary.
4. Assist the child in dealing with problems of self-image.
5. Instruct the child and parents about the potential development of phantom limb pain that may occur after amputation, characterized by tingling, itching, and a painful sensation in the area where the limb was amputated.

VI. Brain Tumors

A. Description

1. An infratentorial (below the tentorium cerebelli) tumor, the most common brain tumor, is located in the posterior third of the brain (primarily in the cerebellum or brainstem) and accounts for the frequency of symptoms resulting from increased ICP.
2. A supratentorial tumor is located within the anterior two thirds of the brain—mainly the cerebrum.

3. The signs and symptoms of a brain tumor depend on its anatomical location and size and, to some extent, on the age of the child; a number of tests may be used in the neurological evaluation, but the most common diagnostic procedure is magnetic resonance imaging (MRI), which determines the location and extent of the tumor.

4. Therapeutic management includes surgery, radiation, and chemotherapy; the treatment of choice is total removal of the tumor without residual neurological damage.

B. Assessment

1. Headache that is worse on awakening and improves during the day
2. Vomiting that is unrelated to feeding or eating
3. Ataxia
4. Seizures
5. Behavioral changes
6. Clumsiness; awkward gait or difficulty walking
7. Diplopia
8. Facial weakness

 **Monitor for signs of increased ICP in a child with a brain tumor and after a craniotomy. If signs of increased ICP occur, notify the HCP immediately.**

C. Preoperative interventions

1. Perform a neurological assessment at least every 4 hours.
2. Institute seizure precautions and safety measures.
3. Assess weight loss and nutritional status.
4. Shave the child’s head as prescribed (provide a favorite cap or hat for the child); shaving the head may also be done in the surgical suite.
5. Prepare the child as much as possible; tell the child that he or she will wake up with a large head dressing.

D. Postoperative interventions

1. Assess neurological and motor function and level of consciousness.
2. Monitor temperature closely, which may be elevated because of hypothalamus or brainstem involvement during surgery; maintain a cooling blanket by the bedside.
3. Monitor for signs of respiratory infection.
4. Monitor for signs of meningitis (opisthotonos, Kernig’s and Brudzinski’s signs).
5. Monitor for signs of increased ICP (see [Box 35-1](#); see also [Chapter 42](#)).
6. Monitor for hemorrhage, checking the back of the head dressing for posterior pooling of blood; mark drainage edges with marker, reinforce dressing if needed, and do not change dressing without a specific HCP prescription.
7. Assess pupillary response; sluggish, dilated, or unequal pupils are reported immediately

BOX 35-4 Positioning After Craniotomy

Assess the health care provider's prescription for positioning, including the degree of neck flexion.

If a large tumor has been removed, the child is not placed on the operative side because the brain may shift suddenly to that cavity.

In an infratentorial procedure, the child usually is positioned flat and on either side.

In a supratentorial procedure, the head usually is elevated above the heart level to facilitate cerebrospinal fluid drainage and to decrease excessive blood flow to the brain to prevent hemorrhage.

Never place the child in Trendelenburg position because it increases intracranial pressure and the risk of hemorrhage.

because they may indicate increased ICP and potential brainstem herniation.

8. Monitor for colorless drainage on the dressing or from the ears or nose, which indicates cerebrospinal fluid and should be reported immediately; assess for the presence of glucose in the drainage (dipstick).
9. Assess the HCP's prescription for positioning, including the degree of neck flexion (Box 35-4).
10. Monitor intravenous fluids closely.
11. Promote measures that prevent vomiting (vomiting increases ICP and the risk for incisional rupture).
12. Provide a quiet environment.
13. Administer analgesics as prescribed.
14. Provide emotional support to the child and parents, and promote optimal growth and development.

CRITICAL THINKING What Should You Do?

Answer: A white blood cell count of 2000 mm^3 ($2.0 \times 10^9/\text{L}$) and an absolute neutrophil count of 800 mm^3 are indicative of a neutropenic state, and the child should be placed on neutropenic precautions. The absolute neutrophil count (ANC) is the standard of care in determining whether a child is in a neutropenic state and the need for protective isolation. If the ANC is less than 50% (0.50), a severe infection risk is present. Interventions include a private room; good handwashing technique or use of alcohol-based hand rub before entering the child's room and before touching the client or any belongings; ensuring that the child's room and bathroom are cleaned a minimum of once per day; limiting the number of people entering the child's room (no sick persons should enter the room); using strict aseptic technique for all invasive procedures; keeping fresh flowers and potted plants out of the room; and implementing a low-bacteria diet (no fresh fruits or vegetables or undercooked meats).

PRACTICE QUESTIONS

362. The nurse is monitoring a child for bleeding after surgery for removal of a brain tumor. The nurse checks the head dressing for the presence of blood and notes a colorless drainage on the back of the dressing. Which intervention should the nurse perform immediately?
 1. Reinforce the dressing.
 2. Notify the health care provider (HCP).
 3. Document the findings and continue to monitor.
 4. Circle the area of drainage and continue to monitor.
363. A child undergoes surgical removal of a brain tumor. During the postoperative period, the nurse notes that the child is restless, the pulse rate is elevated, and the blood pressure has decreased significantly from the baseline value. The nurse suspects that the child is in shock. Which is the most appropriate nursing action?
 1. Place the child in a supine position.
 2. Notify the health care provider (HCP).
 3. Place the child in Trendelenburg position.
 4. Increase the flow rate of the intravenous fluids.
364. The mother of a 4-year-old child tells the pediatric nurse that the child's abdomen seems to be swollen. During further assessment, the mother tells the nurse that the child is eating well and that the activity level of the child is unchanged. The nurse, suspecting the possibility of Wilms' tumor, should avoid which during the physical assessment?
 1. Palpating the abdomen for a mass
 2. Assessing the urine for the presence of hematuria
 3. Monitoring the temperature for the presence of fever
 4. Monitoring the blood pressure for the presence of hypertension
365. The nurse provides a teaching session to the nursing staff regarding osteosarcoma. Which statement by a member of the nursing staff indicates a need for information?
 1. "The femur is the most common site of this sarcoma."
 2. "The child does not experience pain at the primary tumor site."
 3. "Limping, if a weight-bearing limb is affected, is a clinical manifestation."
 4. "The symptoms of the disease in the early stage are almost always attributed to normal growing pains."

366. The nurse analyzes the laboratory values of a child with leukemia who is receiving chemotherapy. The nurse notes that the platelet count is $19,500 \text{ mm}^3$ ($19.5 \times 10^9/\text{L}$). On the basis of this laboratory result, which intervention should the nurse include in the plan of care?
1. Initiate bleeding precautions.
 2. Monitor closely for signs of infection.
 3. Monitor the temperature every 4 hours.
 4. Initiate protective isolation precautions.
367. The nurse is monitoring a 3-year-old child for signs and symptoms of increased intracranial pressure (ICP) after a craniotomy. The nurse plans to monitor for which early sign or symptom of increased ICP?
1. Vomiting
 2. Bulging anterior fontanel
 3. Increasing head circumference
 4. Complaints of a frontal headache
368. A 4-year-old child is admitted to the hospital for abdominal pain. The mother reports that the child has been pale and excessively tired and is bruising easily. On physical examination, lymphadenopathy and hepatosplenomegaly are noted. Diagnostic studies are being performed because acute lymphocytic leukemia is suspected. The nurse determines that which laboratory result confirms the diagnosis?
1. Lumbar puncture showing no blast cells
 2. Bone marrow biopsy showing blast cells
 3. Platelet count of $350,000 \text{ mm}^3$ ($350 \times 10^9/\text{L}$)
 4. White blood cell count 4500 mm^3 ($4.5 \times 10^9/\text{L}$)
369. A 6-year-old child with leukemia is hospitalized and is receiving combination chemotherapy. Laboratory results indicate that the child is neutropenic, and protective isolation procedures are initiated. The grandmother of the child visits and brings a fresh bouquet of flowers picked from her garden, and asks the nurse for a vase for the flowers. Which response should the nurse provide to the grandmother?
1. "I have a vase in the utility room, and I will get it for you."
 2. "I will get the vase and wash it well before you put the flowers in it."
 3. "The flowers from your garden are beautiful, but should not be placed in the child's room at this time."
 4. "When you bring the flowers into the room, place them on the bedside stand as far away from the child as possible."
370. A diagnosis of Hodgkin's disease is suspected in a 12-year-old child. Several diagnostic studies are performed to determine the presence of this disease. Which diagnostic test result will confirm the diagnosis of Hodgkin's disease?
1. Elevated vanillylmandelic acid urinary levels
 2. The presence of blast cells in the bone marrow
 3. The presence of Epstein-Barr virus in the blood
 4. The presence of Reed-Sternberg cells in the lymph nodes
- ❖ 371. Which specific nursing interventions are implemented in the care of a child with leukemia who is at risk for infection? Select all that apply.
- 1. Maintain the child in a semiprivate room.
 - 2. Reduce exposure to environmental organisms.
 - 3. Use strict aseptic technique for all procedures.
 - 4. Ensure that anyone entering the child's room wears a mask.
 - 5. Apply firm pressure to a needle-stick area for at least 10 minutes.
- ❖ 372. The nurse is performing an assessment on a 10-year-old child suspected to have Hodgkin's disease. Which assessment findings are specifically characteristic of this disease? Select all that apply.
- 1. Abdominal pain
 - 2. Fever and malaise
 - 3. Anorexia and weight loss
 - 4. Painful, enlarged inguinal lymph nodes
 - 5. Painless, firm, and movable adenopathy in the cervical area

ANSWERS

362. 2

Rationale: Colorless drainage on the dressing in a child after craniotomy indicates the presence of cerebrospinal fluid and should be reported to the HCP immediately. Options 1, 3, and 4 are not the immediate nursing intervention because they do not address the need for immediate intervention to prevent complications.

Test-Taking Strategy: Note the **strategic word**, immediately. Eliminate options 3 and 4 because they are **comparable or alike** and delay necessary intervention. Also, note the words colorless drainage. This should alert you quickly to the possibility of the presence of cerebrospinal fluid and direct you to the correct option.

Review: Assessment of **cerebrospinal fluid**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Oncological

Priority Concepts: Clinical Judgment; Intracranial Regulation

Reference: Hockenberry, Wilson (2015), p. 1409.

363. 2

Rationale: In the event of shock, the HCP is notified immediately before the nurse changes the child's position or increases intravenous fluids. After craniotomy, a child is never placed in the supine or Trendelenburg position because it increases intracranial pressure (ICP) and the risk of bleeding. The head of the bed should be elevated. Increasing intravenous fluids can cause an increase in ICP.

Test-Taking Strategy: Focus on the **subject**, care for the child following craniotomy, and note the **strategic words**, most appropriate. Eliminate options 1 and 3 because these positions could increase ICP. Eliminate option 4 because increasing the flow rate could also increase ICP. In addition, the nurse should not increase intravenous fluids without an HCP's prescription.

Review: Care following surgical removal of a **brain tumor** or **craniotomy**

Level of Cognitive Ability: Synthesizing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

364. 1

Rationale: Wilms' tumor is the most common intraabdominal and kidney tumor of childhood. If Wilms' tumor is suspected, the tumor mass should not be palpated by the nurse. Excessive manipulation can cause seeding of the tumor and spread of the cancerous cells. Hematuria, fever, and hypertension are clinical manifestations associated with Wilms' tumor.

Test-Taking Strategy: Focus on the **subject**, the action to avoid. Knowledge that this tumor is an intraabdominal and kidney tumor will assist in eliminating options 2 and 4 because of the relationship of these options to renal function. Next, thinking about the effect of palpating the tumor will direct you to the correct option from the remaining options.

365. 2

Rationale: Osteosarcoma is the most common bone cancer in children. Cancer usually is found in the metaphysis of long bones, especially in the lower extremities, with most tumors occurring in the femur. Osteosarcoma is manifested clinically by progressive, insidious, and intermittent pain at the tumor site. By the time these children receive medical attention, they

may be in considerable pain from the tumor. Options 1, 3, and 4 are accurate regarding osteosarcoma.

Test-Taking Strategy: Note the **strategic words**, need for information. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Knowledge that osteosarcoma is a malignant tumor of the bone will direct you to the correct option.

366. 1

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). If a child is severely thrombocytopenic and has a platelet count less than $20,000 \text{ mm}^3$ ($20.0 \times 10^9/\text{L}$), bleeding precautions need to be initiated because of the increased risk of bleeding or hemorrhage. Precautions include limiting activity that could result in head injury, using soft toothbrushes, checking urine and stools for blood, and administering stool softeners to prevent straining with constipation. In addition, suppositories, enemas, and rectal temperatures are avoided. Options 2, 3, and 4 are related to the prevention of infection rather than bleeding.

Test-Taking Strategy: Note that the platelet count is low and recall that a low platelet count places the child at risk for bleeding. In addition, note that options 2, 3, and 4 are **comparable or alike** because they relate to prevention of and monitoring for infection.

Review: Interventions for child at **risk for bleeding** and **leukemia**

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Planning

Content Area: Pediatrics—Oncological

Priority Concepts: Cellular Regulation; Clotting

367. 1

Rationale: The brain, although well protected by the solid bony cranium, is highly susceptible to pressure that may accumulate within the enclosure. Volume and pressure must remain constant within the brain. A change in the size of the brain, such as occurs with edema or increased volume of intracranial blood or cerebrospinal fluid without a compensatory change, leads to an increase in ICP, which may be life-threatening. Vomiting, an early sign of increased ICP, can become excessive as pressure builds up and stimulates the medulla in the brainstem, which houses the vomiting center. Children with open fontanels (posterior fontanel closes at 2 to 3 months; anterior fontanel closes at 12 to 18 months) compensate for ICP changes by skull

expansion and subsequent bulging fontanel. When the fontanel has closed, nausea, excessive vomiting, diplopia, and headaches become pronounced, with headaches becoming more prevalent in older children.

Test-Taking Strategy: Note the **strategic word**, early; focus on the age of the child, and use age as the key to principles of growth and development. Knowing when the fontanel closes and focusing on the child's age as 3 years eliminates options 2 and 3. The subjective symptom of headache in option 4 is unreliable in a 3-year-old, so eliminate this option.

Review: **Increased intracranial pressure**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Oncological

Priority Concepts: Development; Intracranial Regulation

Reference: Hockenberry, Wilson (2015), p. 1410.

368. 2

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. The confirmatory test for leukemia is microscopic examination of bone marrow obtained by bone marrow aspirate and biopsy, which is considered positive if blast cells are present. An altered platelet count occurs as a result of the disease, but also may occur as a result of chemotherapy and does not confirm the diagnosis. The white blood cell count may be normal, high, or low in leukemia. A lumbar puncture may be done to look for blast cells in the spinal fluid that indicate central nervous system disease.

Test-Taking Strategy: Focus on the **subject**, bone marrow biopsy and leukemia, and note the word confirms in the question. This word and knowledge that the bone marrow is affected in leukemia will direct you to the correct option.

Review: Confirmatory diagnostic tests for **leukemia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Oncological

Priority Concepts: Cellular Regulation; Clinical Judgment

Reference: Hockenberry, Wilson (2015), pp. 1400-1401.

369. 3

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). For a hospitalized neutropenic child, flowers or plants should not be kept in the room because standing water and damp soil harbor *Aspergillus* and *Pseudomonas aeruginosa*, to which the child is susceptible. In addition, fresh fruits and vegetables harbor molds and should be avoided until the white blood cell count increases.

Test-Taking Strategy: Note that options 1 and 2 are **comparable or alike** and should be eliminated first; these options indicate that it is acceptable to place the flowers in the child's room. From the remaining options, select the correct option over option 4 because this response maintains the protective isolation procedures required.

Review: **Protective isolation procedures** and **neutropenia**

Level of Cognitive Ability: Applying

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Oncological

Priority Concepts: Infection; Safety

Reference: McKinney et al. (2013), p. 1276.

370. 4

Rationale: Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes. The presence of giant, multinucleated cells (Reed-Sternberg cells) is the classic characteristic of this disease. Elevated levels of vanillylmandelic acid in the urine may be found in children with neuroblastoma. The presence of blast cells in the bone marrow indicates leukemia. Epstein-Barr virus is associated with infectious mononucleosis.

Test-Taking Strategy: Focus on the **subject**, confirmatory diagnostic tests for Hodgkin's disease. Think about the pathophysiology associated with Hodgkin's disease. Remember that the Reed-Sternberg cell is characteristic of Hodgkin's disease.

Review: **Hodgkin's disease**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Oncological

Priority Concepts: Cellular Regulation; Clinical Judgment

Reference: McKinney et al. (2013), pp. 1285-1286.

❖ 371. 2, 3, 4

Rationale: Leukemia is a malignant increase in the number of leukocytes, usually at an immature stage, in the bone marrow. It affects the bone marrow, causing anemia from decreased erythrocytes, infection from neutropenia, and bleeding from decreased platelet production (thrombocytopenia). A common complication of treatment for leukemia is overwhelming infection secondary to neutropenia. Measures to prevent infection include the use of a private room, strict aseptic technique, restriction of visitors and health care personnel with active infection, strict hand washing, ensuring that anyone entering the child's room wears a mask, and reducing exposure to environmental organisms by eliminating raw fruits and vegetables from the diet and fresh flowers from the child's room and by not leaving standing water in the child's room. Applying firm pressure to a needle-stick area for at least 10 minutes is a measure to prevent bleeding.

Test-Taking Strategy: Focus on the **subject**, preventing infection. Reading each intervention carefully and keeping this subject in mind will assist in answering the question. A semiprivate room places the child at risk for infection. Applying firm pressure to a needle-stick area is related to preventing bleeding.

Review: **Leukemia** and **risk for infection**

Level of Cognitive Ability: Analyzing

Client Needs: Safe and Effective Care Environment

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Oncological

Priority Concepts: Infection; Safety

Reference: Hockenberry, Wilson (2015), pp. 1392-1393, 1401.

❖ 372. 1, 5

Rationale: Hodgkin's disease (a type of lymphoma) is a malignancy of the lymph nodes. Specific clinical manifestations associated with Hodgkin's disease include painless, firm, and movable adenopathy in the cervical and supraclavicular areas and abdominal pain as a result of enlarged retroperitoneal nodes. Hepatosplenomegaly also is noted. Although fever, malaise, anorexia, and weight loss are associated with Hodgkin's disease, these manifestations are seen in many disorders. Test-Taking Strategy: Note the words specifically characteristic in the question. Eliminate options 2 and 3 first because these

symptoms are **comparable or alike** in that they are general and vague. Recalling that painless adenopathy is associated with Hodgkin's disease and abdominal pain will direct you to the correct options.

Review: **Hodgkin's disease**

CHAPTER 36

Metabolic and Endocrine Disorders

PRIORITY CONCEPTS Glucose Regulation; Thermoregulation

CRITICAL THINKING What Should You Do?

A child is diagnosed with phenylketonuria. What interventions should the nurse include in the plan of care?
Answer located on p. 435.

I. Fever

A. Description

1. Fever is an abnormal body temperature elevation.
2. A child's temperature can vary depending on activity, emotional stress, disease processes, medications, type of clothing the child is wearing, and temperature of the environment.
3. Assessment findings associated with the fever provide important indications of the seriousness of the fever.

B. Assessment

1. Temperature elevation: Normal temperature range for a child is 36.4°C to 37.0°C (97.5°F to 98.6°F); 38.0°C (100.4°F) is considered to be fever.
2. Flushed skin, warm to touch
3. Diaphoresis
4. Chills
5. Restlessness or lethargy

C. Interventions

1. Monitor vital signs; take the temperature via the electronic route or per agency procedures.
2. Remove excess clothing and blankets, reduce the room temperature, and increase the air circulation; use other cooling measures such as the application of a cool compress to the forehead if appropriate.
3. Administer a sponge bath with tepid water for 20 to 30 minutes and gently squeeze water from a facecloth over the back and chest. Recheck the temperature 30 minutes after the bath. Do not

use alcohol because it can cause peripheral vasoconstriction.

4. Administer antipyretics such as ibuprofen as prescribed.
5. Aspirin should not be administered, unless specifically prescribed, because of the risk of Reye's syndrome.
6. Retake the temperature 30 to 60 minutes after the antipyretic is administered.
7. Provide adequate fluid intake as tolerated and as prescribed.
8. Monitor for signs and symptoms that indicate dehydration and electrolyte imbalances; monitor laboratory values.
9. Instruct the parents in how to take the temperature, how to medicate the child safely, and when it is necessary to call the health care provider (HCP).

II. Dehydration

A. Description

1. Dehydration is a common fluid and electrolyte imbalance in infants and children.
2. In infants and children, the organs that conserve water are immature, placing them at risk for fluid volume deficit.
3. Causes can include decreased fluid intake, diaphoresis, vomiting, diarrhea, diabetic ketoacidosis, and extensive burns or other serious injuries.

! Infants and children are more vulnerable to fluid volume deficit because more of their body water is in the extracellular fluid compartment.

B. Assessment (Table 36-1)

C. Interventions

1. Treat and eliminate the cause of the dehydration.
2. Monitor vital signs.
3. Monitor weight and monitor for changes, including fluid gains and losses.
4. Monitor intake and output and urine for specific gravity.
5. Monitor level of consciousness.

TABLE 36-1 Evaluating the Extent of Dehydration

Clinical Signs	Level of Dehydration		
	Mild	Moderate	Severe
Weight loss—infants	3%-5%	6%-9%	≥10%
Weight loss—children	3%-4%	6%-8%	10%
Pulse	Normal	Slightly increased	Very increased
Respiratory rate	Normal	Slight tachypnea (rapid)	Hyperpnea (deep and rapid)
Blood pressure	Normal	Normal to orthostatic (> 10 mm Hg change)	Orthostatic to shock
Behavior	Normal	Irritable, more thirsty	Hyperirritable to lethargic
Thirst	Slight	Moderate	Intense
Mucous membranes*	Normal	Dry	Parched
Tears	Present	Decreased	Absent; sunken eyes
Anterior fontanel	Normal	Normal to sunken	Sunken
External jugular vein	Visible when supine	Not visible except with supraclavicular pressure	Not visible even with supraclavicular pressure
Skin*	Capillary refill > 2 sec	Slowed capillary refill (2-4 sec [decreased turgor])	Very delayed capillary refill (> 4 sec) and tenting; skin cool, acrocyanotic or mottled
Urine specific gravity	> 1.020	> 1.020; oliguria	Oliguria or anuria

*These signs are less prominent in the child who has hypernatremia.

Data from Jospe N, Forbes G: Fluids and electrolytes—clinical aspects, *Pediatr Rev* 17:395–403, 1996; and Steiner MJ, DeWalt DA, Byerley JS: Is this child dehydrated? *JAMA* 291:2746–2754, 2004. Table from Perry S, Hockenberry M, Lowdermilk D, Wilson D: *Maternal-child nursing care*, ed 4, St. Louis, 2010, Mosby.

6. Monitor skin turgor and mucous membranes for dryness.
7. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte[®] or a similar rehydration solution as prescribed; avoid carbonated beverages, because they are gas-producing, and fluids that contain high amounts of sugar, such as apple juice.
8. For severe dehydration, maintain NPO (nothing by mouth) status to place the bowel at rest and provide fluid and electrolyte replacement by the intravenous (IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and has adequate renal function.
9. Reintroduce a normal diet when rehydration is achieved.
10. Provide instructions to the parents about the types and amounts of fluid to encourage, signs of dehydration, and indications of the need to notify the HCP.

III. Phenylketonuria

A. Description

1. Phenylketonuria is a genetic disorder (autosomal recessive disorder) that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood.

2. It is characterized by blood phenylalanine levels greater than 20 mg/dL (12.1 mmol/L); normal level is 0 to 2 mg/dL (0 to 121 mmol/L).
3. All 50 states require routine screening of all newborns for phenylketonuria.

B. Assessment

1. In all children
 - a. Digestive problems and vomiting
 - b. Seizures
 - c. Musty odor of the urine
 - d. Mental retardation
2. In older children
 - a. Eczema
 - b. Hypertonia
 - c. Hypopigmentation of the hair, skin, and irises
 - d. Hyperactive behavior

C. Interventions

1. Screening of newborn infants for phenylketonuria: The infant should have begun formula or breast milk feeding before specimen collection.
2. If initial screening is positive, a repeat test is performed, and further diagnostic evaluation is required to verify the diagnosis.
3. Rescreen newborns by 14 days of age if the initial screening was done before 48 hours of age.
4. If phenylketonuria is diagnosed, prepare to implement the following:

- Restrict phenylalanine intake; high-protein foods (meats and dairy products) and aspartame are avoided because they contain large amounts of phenylalanine.
- Monitor physical, neurological, and intellectual development.
- Stress the importance of follow-up treatment.
- Encourage the parents to express their feelings about the diagnosis and discuss the risk of phenylketonuria in future children.
- Educate the parents about the use of special preparation formulas and about the foods that contain phenylalanine.
- Consult with social care services to assist the parents with the financial burdens of purchasing special prepared formulas.

IV. Diabetes Mellitus

A. Description (Fig. 36-1)

- Type 1 diabetes mellitus is characterized by the destruction of the pancreatic beta cells, which produce insulin; this results in absolute insulin deficiency.
- Type 2 diabetes mellitus usually arises because of insulin resistance, in which the body fails to use insulin properly, combined with relative (rather than absolute) insulin deficiency.
- Insulin deficiency requires the use of exogenous insulin to promote appropriate glucose use and to prevent complications related to elevated

FIGURE 36-1 Insulin deficiency leading to ketoacidosis.

blood glucose levels, such as hyperglycemia, diabetic ketoacidosis, and death.

- Diagnosis is based on the presence of classic symptoms and an elevated blood glucose level (normal blood glucose level is 70 to 110 mg/dL [4 to 6 mmol/L]); based on HCP preference, normal level may be a lower range).
- Children may need to be admitted directly to the pediatric intensive care unit because of the manifestations of diabetic ketoacidosis, which may be the initial occurrence leading to diagnosis of diabetes mellitus.

B. Assessment

- Polyuria, polydipsia, polyphagia
- Hyperglycemia
- Weight loss
- Unexplained fatigue or lethargy
- Headaches
- Occasional enuresis in a previously toilet-trained child
- Vaginitis in adolescent girls (caused by *Candida*, which thrives in hyperglycemic tissues)
- Fruity odor to breath
- Dehydration
- Blurred vision
- Slow wound healing
- Changes in level of consciousness

C. Long-term effects

- Failure to grow at a normal rate
- Delayed maturation
- Recurrent infections
- Neuropathy
- Cardiovascular disease
- Retinal microvascular disease
- Renal microvascular disease

D. Complications

- Hypoglycemia
- Hyperglycemia
- Diabetic ketoacidosis
- Coma
- Hypokalemia
- Hyperkalemia
- Microvascular changes
- Cardiovascular changes

! For a child with diabetes mellitus, plan to initiate a consultation with the diabetic specialist to plan the child's care.

E. Diet

- Normal healthy nutrition is encouraged, and the total number of calories is individualized based on the child's age and growth expectations.
- As prescribed by the HCP, children with diabetes need no special foods or supplements. They need sufficient calories to balance daily expenditure for energy and to satisfy the requirement for growth and development.

3. Dietary intake should include 3 well-balanced meals per day, eaten at regular intervals, plus a mid-afternoon snack and a bedtime snack; a consistent intake of the prescribed protein, fats, and carbohydrates at each meal and snack is needed (concentrated sweets are discouraged; fat is reduced to 30% or less of the total caloric requirement).
4. Instruct children and parents to carry a source of glucose, such as glucose tablets, with them at all times to treat hypoglycemia if it occurs.
5. Incorporate the diet into the individual child's needs, likes and dislikes, lifestyle, and cultural and socioeconomic patterns.
6. Allow the child to participate in making food choices to provide a sense of control.

F. Exercise

1. Instruct the child in dietary adjustments when exercising.
2. Extra food needs to be consumed for increased activity, usually 10 to 15 g of carbohydrates for every 30 to 45 minutes of activity.
3. Instruct the child to monitor the blood glucose level before exercising.
4. Plan an appropriate exercise regimen with the child, taking the developmental stage into account.

G. Insulin

1. Diluted insulin may be required for some infants to provide small enough doses to avoid hypoglycemia; diluted insulin should be labeled clearly to avoid dosage errors.
2. Laboratory evaluation of glycosylated hemoglobin (HgbA1c) should be performed every 3 months. Reference interval for HgbA1c is less than 6%.
3. Illness, infection, and stress increase the need for insulin, and insulin should not be withheld during illness, infection, or stress because hyperglycemia and ketoacidosis can result.
4. When the child is not receiving anything by mouth for a special procedure, verify with the HCP the need to withhold the morning insulin, and when food, fluids, and insulin are to be resumed.
5. Instruct the child and parents in the administration of insulin.
6. Instruct the child and parents to recognize symptoms of hypoglycemia and hyperglycemia.
7. Instruct the parents in the administration of glucagon intramuscularly or subcutaneously if the child has a hypoglycemic reaction and is unable to consume anything orally (if semiconscious or unconscious).
8. Instruct the child and parents always to have a spare bottle of insulin available.
9. Advise the parents to obtain a MedicAlert bracelet indicating the type and daily insulin dosage prescribed for the child.

10. See Chapter 51 for information on insulin types, administration sites, and administration procedure.

H. Blood glucose monitoring

1. Results provide information needed to maintain good glycemic control.
2. Blood glucose monitoring is more accurate than urine testing.
3. Monitoring requires that the child prick himself or herself several times a day as prescribed (**Box 36-1**).
4. Instruct the child and parents about the proper procedure for obtaining the blood glucose level.
5. Inform the child and parents that the procedure must be done precisely to obtain accurate results.
6. Stress the importance of hand washing before and after performing the procedure to prevent infection.
7. Stress the importance of following the manufacturer's instructions for the blood glucose monitoring device.
8. Instruct the child and parents to calibrate the monitor as instructed by the manufacturer.
9. Instruct the child and parents to check the expiration date on the test strips used for blood glucose monitoring.
10. Instruct the child and parents that if the blood glucose results do not seem reasonable, they should reread the instructions, reassess technique, check the expiration date of the test strips, and perform the procedure again to verify results.

I. Urine testing

1. Instruct the parents and child in the procedure for testing urine for ketones and glucose.
2. Teach the child that the second voided urine specimen is most accurate.
3. The presence of ketones may indicate impending ketoacidosis.

BOX 36-1 Lessening the Pain of Blood Glucose Monitoring

Hold the finger under warm water for a few seconds before puncture (enhances blood flow to the finger).
 Use the ring finger or thumb to obtain a blood sample because blood flows more easily to these areas; puncture the finger just to the side of the finger pad because there are more blood vessels in this area and fewer nerve endings.
 Press the lancet device lightly against the skin to prevent a deep puncture.
 Use glucose monitors that require very small blood samples for measurement.

 Urine glucose testing is an unreliable method of monitoring the glucose level; however, the urine should be tested for ketones when the child is ill or when the blood glucose level is consistently greater than 200 mg/dL (greater than 11.4 mmol/L) or as specified by the HCP.

J. Hypoglycemia

1. Description
 - a. Hypoglycemia is a blood glucose level less than 70 mg/dL (4 mmol/L) (or as specified by the HCP).
 - b. Hypoglycemia results from too much insulin, not enough food, or excessive activity.
2. Signs include headache, nausea, sweating, tremors, lethargy, hunger, confusion, slurred speech, tingling around the mouth, and anxiety.
3. Interventions (Boxes 36-2 and 36-3; see also Priority Nursing Actions)

PRIORITY NURSING ACTIONS

Hypoglycemia in a Hospitalized Child with Diabetes Mellitus

1. Check the child's blood glucose level.
2. Give the child ½ cup of fruit juice or other acceptable item.
3. Take the child's vital signs.
4. Retest the blood glucose level.
5. Give the child a small snack of carbohydrate and protein.
6. Document the child's complaints, actions taken, and outcome.

If a child with diabetes mellitus experiences hypoglycemia, the nurse first would check the child's blood glucose level to verify that the child is experiencing hypoglycemia. When this is verified, the nurse gives the child 10 to 15 g of carbohydrates. The nurse retests the blood glucose level in 15 minutes. In the meantime, the nurse checks the child's vital signs. If the child's symptoms of hypoglycemia do not resolve, the nurse gives the child another 10- to 15-g carbohydrate food item. Otherwise, the nurse provides a small snack of carbohydrates and protein if the child's next scheduled meal is more than 1 hour away from the time of the occurrence. After treatment and resolution of the hypoglycemic event, the nurse documents the occurrence, actions taken, and outcome.

Reference

Hockenberry, Wilson (2015), pp. 1529, 1537.

K. Hyperglycemia

1. Description: Elevated blood glucose level (> 200 mg/dL [11.4 mmol/L], or as specified by the HCP)
2. Signs include polydipsia, polyuria, polyphagia, blurred vision, weakness, weight loss, and syncope.
3. Interventions (Box 36-4)
4. Sick day rules (Box 36-5)

BOX 36-2 Interventions for Hypoglycemia

If possible, confirm hypoglycemia with a blood glucose reading.

Administer glucose immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker.

Give an extra snack if the next meal is not planned for more than 30 minutes or if activity is planned.

If the child becomes unconscious, squeeze cake frosting or glucose paste onto the gums and retest the blood glucose level in 15 minutes (monitor the child closely); if the reading remains low, administer additional glucose.

If the child remains unconscious, the administration of glucagon may be necessary.

In the hospital, prepare to administer dextrose intravenously if the child is unable to consume an oral glucose product.

BOX 36-3 Food Items to Treat Hypoglycemia

- ½ cup of orange juice or sugar-sweetened carbonated beverage
- 8 oz of milk
- 1 small box of raisins
- 3 or 4 hard candies
- 4 sugar cubes (1 Tbsp of sugar)
- 3 or 4 Life Savers candies
- 1 candy bar
- 1 tsp honey
- 2 or 3 glucose tablets

BOX 36-4 Interventions for Hyperglycemia

Instruct the parents to notify the health care provider when the following occur:

- Blood glucose results remain elevated (usually > 200 mg/dL (> 11.4 mmol/L))
- Moderate or high ketonuria is present
- Child is unable to take food or fluids
- Child vomits more than once
- Illness persists

L. Diabetic ketoacidosis

1. Description
 - a. Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs.
 - b. Diabetic ketoacidosis is a life-threatening condition.
 - c. Hyperglycemia that progresses to metabolic acidosis occurs.
 - d. Diabetic ketoacidosis develops over several hours to days.

BOX 36-5 Sick Day Rules for a Diabetic Child

Always give insulin, even if the child does not have an appetite, or contact the health care provider (HCP) for specific instructions.

Test blood glucose levels at least every 4 hours.

Test for urinary ketones with each voiding.

Notify the HCP if moderate or large amounts of urinary ketones are present.

Follow the child's usual meal plan.

Encourage liquids to aid in clearing ketones.

Encourage rest, especially if urinary ketones are present.

Notify the HCP if vomiting, fruity odor to the breath, deep rapid respirations, decreasing level of consciousness, or persistent hyperglycemia occurs.

Adapted from Hockenberry M, Wilson D: Nursing care of infants and children, ed 9, St. Louis, 2011, Mosby.

- e. The blood glucose level is greater than 300 mg/dL (greater than 17.14 mmol/L), and urine and serum ketone tests are positive.

 **Manifestations of diabetic ketoacidosis include signs of hyperglycemia, Kussmaul respirations, acetone (fruity) breath odor, increasing lethargy, and decreasing level of consciousness.**

2. Interventions

- a. Restore circulating blood volume, and protect against cerebral, coronary, or renal hypoperfusion.
- b. Correct dehydration with IV infusions of 0.9% or 0.45% saline as prescribed.
- c. Correct hyperglycemia with IV regular insulin administration as prescribed.
- d. Monitor vital signs, urine output, and mental status closely.
- e. Correct acidosis and electrolyte imbalances as prescribed.
- f. Administer oxygen as prescribed.
- g. Monitor blood glucose level frequently.
- h. Monitor potassium level closely because when the child receives insulin to reduce the blood glucose level, the serum potassium level changes; if the potassium level decreases, potassium replacement may be required.
- i. The child should be voiding adequately before administering potassium; if the child does not have an adequate output, hyperkalemia may result.
- j. Monitor the child closely for signs of fluid overload.
- k. IV dextrose is added as prescribed when the blood glucose reaches an appropriate level.
 1. Treat the cause of hyperglycemia.

CRITICAL THINKING What Should You Do?

Answer: Interventions for phenylketonuria include restricting phenylalanine intake. High-protein foods (meats and dairy products) and products that contain aspartame are avoided because they contain large amounts of phenylalanine. Monitoring physical, neurological, and intellectual development is important to detect any abnormalities. The nurse should stress the importance of follow-up treatment with the parents, encourage the parents to express their feelings about the diagnosis and discuss the risk of phenylketonuria in future children, educate the parents about the use of special preparation formulas and about the foods that contain phenylalanine, and consult with social care services to assist the parents with any financial burdens.

Reference: Hockenberry, Wilson (2015), pp. 70-72.

PRACTICE QUESTIONS

373. A school-age child with type 1 diabetes mellitus has soccer practice and the school nurse provides instructions regarding how to prevent hypoglycemia during practice. Which should the school nurse tell the child to do?
 1. Eat twice the amount normally eaten at lunchtime.
 2. Take half the amount of prescribed insulin on practice days.
 3. Take the prescribed insulin at noontime rather than in the morning.
 4. Eat a small box of raisins or drink a cup of orange juice before soccer practice.
374. The mother of a 6-year-old child who has type 1 diabetes mellitus calls a clinic nurse and tells the nurse that the child has been sick. The mother reports that she checked the child's urine and it was positive for ketones. The nurse should instruct the mother to take which action?
 1. Hold the next dose of insulin.
 2. Come to the clinic immediately.
 3. Encourage the child to drink liquids.
 4. Administer an additional dose of regular insulin.
375. A health care provider prescribes an intravenous (IV) solution of 5% dextrose and half-normal saline (0.45%) with 40 mEq of potassium chloride for a child with hypotonic dehydration. The nurse performs which priority assessment before administering this IV prescription?
 1. Obtains a weight
 2. Takes the temperature
 3. Takes the blood pressure
 4. Checks the amount of urine output

376. An adolescent client with type 1 diabetes mellitus is admitted to the emergency department for treatment of diabetic ketoacidosis. Which assessment findings should the nurse expect to note?
1. Sweating and tremors
 2. Hunger and hypertension
 3. Cold, clammy skin and irritability
 4. Fruity breath odor and decreasing level of consciousness
377. A mother brings her 3-week-old infant to a clinic for a phenylketonuria rescreening blood test. The test indicates a serum phenylalanine level of 1 mg/dL (60.5 μ mol/L). The nurse reviews this result and makes which interpretation?
1. It is positive.
 2. It is negative.
 3. It is inconclusive.
 4. It requires rescreening at age 6 weeks.
378. A child with type 1 diabetes mellitus is brought to the emergency department by the mother, who states that the child has been complaining of abdominal pain and has been lethargic. Diabetic ketoacidosis is diagnosed. Anticipating the plan of care, the nurse prepares to administer which type of intravenous (IV) infusion?
1. Potassium infusion
 2. NPH insulin infusion
 3. 5% dextrose infusion
 4. Normal saline infusion
379. The nurse has just administered ibuprofen to a child with a temperature of 102 °F (38.8 °C). The nurse should also take which action?
1. Withhold oral fluids for 8 hours.
 2. Sponge the child with cold water.
 3. Plan to administer salicylate in 4 hours.
 4. Remove excess clothing and blankets from the child.
380. A child has fluid volume deficit. The nurse performs an assessment and determines that the child is improving and the deficit is resolving if which finding is noted?
1. The child has no tears.
 2. Urine specific gravity is 1.035.
 3. Capillary refill is less than 2 seconds.
 4. Urine output is less than 1 mL/kg/hour.
- ❖ 381. The nurse should implement which interventions for a child older than 2 years with type 1 diabetes mellitus who has a blood glucose level of 60 mg/dL (3.4 mmol/L)? Select all that apply.
- 1. Administer regular insulin.
 - 2. Encourage the child to ambulate.
 - 3. Give the child a teaspoon of honey.
 - 4. Provide electrolyte replacement therapy intravenously.
 - 5. Wait 30 minutes and confirm the blood glucose reading.
 - 6. Prepare to administer glucagon subcutaneously if unconsciousness occurs.

ANSWERS

373. 4

Rationale: Hypoglycemia is a blood glucose level less than 70 mg/dL (4 mmol/L) and results from too much insulin, not enough food, or excessive activity. An extra snack of 15 to 30 g of carbohydrates eaten before activities such as soccer practice would prevent hypoglycemia. A small box of raisins or a cup of orange juice provides 15 to 30 g of carbohydrates. The child or parents should not be instructed to adjust the amount or time of insulin administration. Meal amounts should not be doubled.

Test-Taking Strategy: Use general medication guidelines to eliminate options 2 and 3 first, noting that they are **comparable or alike** and indicate changing the amount of insulin or time of administration. From the remaining options, recalling the definition of hypoglycemia and its manifestations and associated treatment will direct you to the correct option.

Review: Prevention of **hypoglycemia**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Glucose Regulation; Health Promotion
Reference: Hockenberry, Wilson (2015), p. 1537.

374. 3

Rationale: When the child is sick, the mother should test for urinary ketones with each voiding. If ketones are present, liquids are essential to aid in clearing the ketones. The child should be encouraged to drink liquids. Bringing the child to the clinic immediately is unnecessary. Insulin doses should not be adjusted or changed.

Test-Taking Strategy: Use general medication guidelines. Eliminate options 1 and 4, noting that they are **comparable or alike**. Recall that insulin doses should not be adjusted or changed. From the remaining options, note the words positive for ketones in the question. Recalling that liquids are essential to aid in clearing the ketones will direct you to the correct option.

Review: **Sick day rules** for the **diabetic child**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Clinical Judgment; Glucose Regulation

Reference: Hockenberry, Wilson (2015), pp. 1529, 1536.

375. 4

Rationale: In hypotonic dehydration, electrolyte loss exceeds water loss. The priority assessment before administering potassium chloride intravenously would be to assess the status of the urine output. Potassium chloride should never be administered in the presence of oliguria or anuria. If the urine output is less than 1 to 2 mL/kg/hour, potassium chloride should not be administered. Although options 1, 2, and 3 are appropriate assessments for a child with dehydration, these assessments are not related specifically to the IV administration of potassium chloride.

Test-Taking Strategy: Note the **strategic word**, priority. Focus on the IV prescription. Recalling that the kidneys play a key role in the excretion and reabsorption of potassium will direct you to the correct option.

Review: Nursing considerations for the administration of **potassium chloride**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Clinical Judgment; Fluid and Electrolytes

Reference: Hockenberry, Wilson (2015), pp. 952-953.

376. 4

Rationale: Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Signs of hyperglycemia include fruity breath odor and a decreasing level of consciousness. Hunger can be a sign of hypoglycemia or hyperglycemia, but hypertension is not a sign of diabetic ketoacidosis. Hypotension occurs because of a decrease in blood volume related to the dehydrated state that occurs during diabetic ketoacidosis. Cold clammy skin, irritability, sweating, and tremors all are signs of hypoglycemia.

Test-Taking Strategy: Focus on the **subject**, the signs of diabetic ketoacidosis, and recall that in this condition the blood glucose level is elevated. Eliminate options 1, 2, and 3 because these signs do not occur with hyperglycemia. Recall that fruity breath odor and a change in the level of consciousness can occur during diabetic ketoacidosis.

Review: Signs and symptoms of **hyperglycemia**, **hypoglycemia**, and **diabetic ketoacidosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Clinical Judgment; Glucose Regulation

Reference: Hockenberry, Wilson (2015), p. 1528.

377. 2

Rationale: Phenylketonuria is a genetic (autosomal recessive) disorder that results in central nervous system damage from toxic levels of phenylalanine (an essential amino acid) in the blood. It is characterized by blood phenylalanine levels greater than 20 mg/dL (12.1 mmol/L); normal level is 0 to 2 mg/dL (0 to 121 mmol/L). A result of 1 mg/dL is a negative test result.

Test-Taking Strategy: Eliminate options 3 and 4 first because they are **comparable or alike**, indicating no definitive finding. Note that the level identified in the question is a low level; this should assist in directing you to the correct option.

Review: **Phenylketonuria**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Clinical Judgment; Health Promotion

Reference: Hockenberry, Wilson (2015), p. 71.

378. 4

Rationale: Diabetic ketoacidosis is a complication of diabetes mellitus that develops when a severe insulin deficiency occurs. Hyperglycemia occurs with diabetic ketoacidosis. Rehydration is the initial step in resolving diabetic ketoacidosis. Normal saline is the initial IV rehydration fluid. NPH insulin is never administered by the IV route. Dextrose solutions are added to the treatment when the blood glucose level decreases to an acceptable level. Intravenously administered potassium may be required, depending on the potassium level, but would not be part of the initial treatment.

Test-Taking Strategy: Focus on the **subject**, treatment for diabetic ketoacidosis. Eliminate option 3, knowing that dextrose would not be administered in a hyperglycemic state. Eliminate option 2 next, knowing that NPH insulin is not administered by the IV route. Recalling that hydration is the initial treatment in diabetic ketoacidosis will direct you to the correct option.

Review: **Diabetic ketoacidosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Planning

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Clinical Judgment; Glucose Regulation

Reference: Hockenberry, Wilson (2015), p. 1530.

379. 4

Rationale: After administering ibuprofen, excess clothing and blankets should be removed. The child can be sponged with tepid water but not cold water, because the cold water can cause shivering, which increases metabolic requirements above those already caused by the fever. Aspirin is not administered to a child with fever because of the risk of Reye's syndrome. Fluids should be encouraged to prevent dehydration, so oral fluids should not be withheld.

Test-Taking Strategy: Focus on the **subject**, interventions for an elevated temperature. Remember that cooling measures such as removing excess clothing and blankets should be done when a child has a fever. Options 1, 2, and 3 are not interventions for a child with a fever.

Review: Interventions for **fever**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Clinical Judgment; Thermoregulation

Reference: Hockenberry, Wilson (2015), p. 899.

380. 3

Rationale: Indicators that fluid volume deficit is resolving would be capillary refill less than 2 seconds, specific gravity of 1.003 to 1.030, urine output of at least 1 mL/kg/hour, and adequate tear production. A capillary refill time less than 2 seconds is the only indicator that the child is improving. Urine output of less than 1 mL/kg/hour, a specific gravity of 1.035, and no tears would indicate that the deficit is not resolving.

Test-Taking Strategy: Focus on the **subject**, assessment findings indicating that fluid volume deficit is resolving. Recall the parameters that indicate adequate hydration status. The only option that indicates an improving fluid balance is option 3. The other options indicate fluid imbalance.

Review: **Fluid volume deficit** and **fluid volume excess**

Level of Cognitive Ability: Evaluating

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Evaluation

Content Area: Pediatrics—Metabolic/Endocrine

Priority Concepts: Evidence; Fluid and Electrolyte Balance

Reference: Hockenberry, Wilson (2015), p. 958.

❖ 381. 3, 6

Rationale: Hypoglycemia is defined as a blood glucose level less than 70 mg/dL (4 mmol/L). Hypoglycemia occurs as a result of too much insulin, not enough food, or excessive activity. If possible, the nurse should confirm hypoglycemia with a blood glucose reading. Glucose is administered orally

immediately; rapid-releasing glucose is followed by a complex carbohydrate and protein, such as a slice of bread or a peanut butter cracker. An extra snack is given if the next meal is not planned for more than 30 minutes or if activity is planned. If the child becomes unconscious, cake frosting or glucose paste is squeezed onto the gums, and the blood glucose level is retested in 15 minutes; if the reading remains low, additional glucose is administered. If the child remains unconscious, administration of glucagon may be necessary, and the nurse should be prepared for this intervention. Encouraging the child to ambulate and administering regular insulin would result in a lowered blood glucose level. Providing electrolyte replacement therapy intravenously is an intervention to treat diabetic ketoacidosis. Waiting 30 minutes to confirm the blood glucose level delays necessary intervention.

Test-Taking Strategy: Focus on the **subject**, a low blood glucose level, and on the information in the question. Think about the pathophysiology associated with hypoglycemia and how it is treated. Recalling that a blood glucose level of 60 mg/dL (3.4 mmol/L) indicates hypoglycemia will assist in determining the correct interventions.

Review: Interventions for **hypoglycemia**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Gastrointestinal Disorders

PRIORITY CONCEPTS Elimination; Nutrition

CRITICAL THINKING What Should You Do?

A child suddenly vomits. What should the nurse do to prevent aspiration?

Answer located on p. 453.

I. Vomiting

A. Description

1. The major concerns when a child is vomiting are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic alkalosis.
2. Additional concerns include aspiration and the development of atelectasis or pneumonia.
3. Causes of vomiting include acute infectious diseases, increased intracranial pressure, toxic ingestions, food intolerance, mechanical obstruction of the gastrointestinal tract, metabolic disorders, and psychogenic disorders.

B. Assessment

1. Character of vomitus
2. Signs of aspiration
3. Presence of pain and abdominal cramping
4. Signs of dehydration and fluid and electrolyte imbalances
5. Signs of metabolic alkalosis

C. Interventions

1. Maintain a patent airway.
2. Position the child on the side to prevent aspiration.
3. Monitor the character, amount, and frequency of vomiting.
4. Assess the force of the vomiting; projectile vomiting may indicate pyloric stenosis or increased intracranial pressure.
5. Monitor strict intake and output.
6. Monitor for signs and symptoms of dehydration, such as a sunken fontanel (age-appropriate), nonelastic skin turgor, dry mucous membranes, decreased tear production, and oliguria.

7. Monitor electrolyte levels.

8. Provide oral rehydration therapy as tolerated and as prescribed; begin feeding slowly, with small amounts of fluid at frequent intervals.

9. Administer antiemetics as prescribed.

10. Assess for abdominal pain or diarrhea.

11. Advise the parents to inform the health care provider (HCP) if signs of dehydration, blood in the vomitus, forceful vomiting, or abdominal pain are present.

II. Diarrhea

A. Description

1. Acute diarrhea is a cause of dehydration, particularly in children younger than 5 years.
2. Causes of acute diarrhea include acute infectious disorders of the gastrointestinal tract, antibiotic therapy, rotavirus, and parasitic infestation.
3. Causes of chronic diarrhea include malabsorption syndromes, inflammatory bowel disease, immunodeficiencies, food intolerances, and nonspecific factors.
4. Rotavirus is a cause of serious gastroenteritis and is a nosocomial (hospital-acquired) pathogen that is most severe in children 3 to 24 months old; children younger than 3 months have some protection because of maternally acquired antibodies.

B. Assessment

1. Character of stools
2. Presence of pain and abdominal cramping
3. Signs of dehydration and fluid and electrolyte imbalances
4. Signs of metabolic acidosis

C. Interventions

1. Monitor character, amount, and frequency of diarrhea.
2. Provide enteric isolation as required; instruct the parents in effective hand-washing technique (children should be taught this technique also).
3. Monitor skin integrity.
4. Monitor strict intake and output.

5. Monitor electrolyte levels.
6. Monitor for signs and symptoms of dehydration.
7. For mild to moderate dehydration, provide oral rehydration therapy with Pedialyte[®] or a similar rehydration solution as prescribed; avoid carbonated beverages, because they are gas-producing, and fluids that contain high amounts of sugar, such as apple juice.
8. For severe dehydration, maintain NPO (nothing by mouth) status to place the bowel at rest and provide fluid and electrolyte replacement by the intravenous (IV) route as prescribed; if potassium is prescribed for IV administration, ensure that the child has voided before administering and has adequate renal function.
9. Reintroduce a normal diet when rehydration is achieved.

! The major concerns when a child is having diarrhea are the risk of dehydration, the loss of fluid and electrolytes, and the development of metabolic acidosis.

III. Cleft Lip and Cleft Palate

A. Description

1. Cleft lip and cleft palate are congenital anomalies that occur as a result of failure of soft tissue or bony structure to fuse during embryonic development.

2. The defects involve abnormal openings in the lip and palate that may occur unilaterally or bilaterally and are readily apparent at birth.
3. Causes include **hereditary** and environmental factors—exposure to radiation or rubella virus, chromosome abnormalities, and teratogenic factors.
4. Closure of a cleft lip defect precedes closure of the cleft palate and is usually performed by age 3 to 6 months.
5. Cleft palate repair is usually performed between 6 and 24 months of age to allow for the palatal changes that occur with normal **growth**; a cleft palate is closed as early as possible to facilitate speech development.
6. A child with cleft palate is at risk for developing frequent otitis media; this can result in hearing loss.
7. An interprofessional team approach, including audiologists, orthodontists, plastic surgeons, and occupational and speech therapists, is taken to address the many needs of the child.

B. Assessment (Fig. 37-1)

1. Cleft lip can range from a slight notch to a complete separation from the floor of the nose.
2. Cleft palate can include nasal distortion, midline or bilateral cleft, and variable extension from the uvula and soft and hard palate.

FIGURE 37-1 Variations in clefts of lip and palate at birth. A, Notch in vermilion border. B, Unilateral cleft lip and palate. C, Bilateral cleft lip and palate. D, Cleft palate.

 C. Interventions

1. Assess the ability to suck, swallow, handle normal secretions, and breathe without distress.
2. Assess fluid and calorie intake daily.
3. Monitor daily weight.
4. Modify feeding techniques; plan to use specialized feeding techniques, obturators, and special nipples and feeders.
5. Hold the infant in an upright position and direct the formula to the side and back of the mouth to prevent aspiration.
6. Feed small amounts gradually and burp frequently.
7. Keep suction equipment and a bulb syringe at the bedside.
8. Teach the parents special feeding or suctioning techniques.
9. Teach the parents the ESSR method of feeding—enlarge the nipple, stimulate the sucking reflex, swallow, rest to allow the infant to finish swallowing what has been placed in the mouth.
10. Encourage parents to express their feelings about the disorder.
11. Encourage parental bonding with the infant, including holding the infant and calling the infant by name.

D. Postoperative interventions

1. Cleft lip repair
 - a. Provide lip protection; a metal appliance or adhesive strips may be taped securely to the cheeks to prevent trauma to the suture line.
 - b. Avoid positioning the infant on the side of the repair or in the prone position because these positions can cause rubbing of the surgical site on the mattress (position on the back upright and position to prevent airway obstruction by secretions, blood, or the tongue).
 - c. Keep the surgical site clean and dry; after feeding, gently cleanse the suture line of formula or serosanguineous drainage with a solution such as normal saline or as designated by agency procedure.
 - d. Apply antibiotic ointment to the site as prescribed.
 - e. Elbow restraints should be used to prevent the infant from injuring or traumatizing the surgical site.
 - f. Monitor for signs and symptoms of infection at the surgical site.
2. Cleft palate repair
 - a. Feedings are resumed by bottle, breast, or cup per surgeon preference; some surgeons prescribe the use of an Asepto[®] syringe for feeding or a soft cup such as a sippy cup.
 - b. Oral packing may be secured to the palate (usually removed in 2 to 3 days).

- c. Do not allow the child to brush his or her teeth.
- d. Instruct the parents to avoid offering hard food items to the child, such as toast or cookies.

3. Soft elbow or jacket restraints may be used (check agency policies and procedures) to keep the child from touching the repair site; remove restraints at least every 2 hours (or per agency procedure) to assess skin integrity and circulation and to allow for exercising the arms.
4. Avoid the use of oral suction or placing objects in the mouth such as a tongue depressor, thermometer, straws, spoons, forks, or pacifiers.
5. Provide analgesics for pain as prescribed.
6. Instruct the parents in feeding techniques and in the care of the surgical site.
7. Instruct the parents to monitor for signs of infection at the surgical site, such as redness, swelling, or drainage.
8. Encourage the parents to hold the child.
9. Initiate appropriate referrals such as a dental referral and speech therapy referral.

IV. Esophageal Atresia and Tracheoesophageal Fistula (Fig. 37-2)

A. Description

1. The esophagus terminates before it reaches the stomach, ending in a blind pouch, or a fistula is present that forms an unnatural connection with the trachea.
2. The condition causes oral intake to enter the lungs or a large amount of air to enter the stomach, presenting a risk of coughing and choking; severe abdominal distention can occur.
3. Aspiration pneumonia and severe respiratory distress may develop, and death is likely to occur without surgical intervention.
4. Treatment includes maintenance of a patent airway, prevention of aspiration pneumonia, gastric or blind pouch decompression, supportive therapy, and surgical repair.

B. Assessment

1. Frothy saliva in the mouth and nose and excessive drooling
2. The “3 Cs”—coughing and choking during feedings and unexplained cyanosis
3. Regurgitation and vomiting
4. Abdominal distention
5. Increased respiratory distress during and after feeding

C. Preoperative interventions

1. The infant may be placed in a radiant warmer in which humidified oxygen is administered (intubation and mechanical ventilation may be necessary if respiratory distress occurs).
 2. Maintain NPO status.
 3. Maintain IV fluids as prescribed.
 4. Monitor respiratory status closely.
- 

FIGURE 37-2 Congenital atresia of esophagus and tracheoesophageal fistula. A, Upper and lower segments of esophagus end in blind sac (occurring in 5% to 8% of such infants). B, Upper segment of esophagus ends in atresia and connects to trachea by fistulous tract (occurring rarely). C, Upper segment of esophagus ends in blind pouch; lower segment connects with trachea by small fistulous tract (occurring in 80% to 95% of such infants). D, Both segments of esophagus connect by fistulous tracts to trachea (occurring in less than 1% of such infants). Infant may aspirate with first feeding. E, Esophagus is continuous, but connects by fistulous tract to trachea (known as H-type).

5. Suction accumulated secretions from the mouth and pharynx.
6. Maintain in a supine upright position (at least 30 degrees upright) to facilitate drainage and prevent aspiration of gastric secretions.
7. Keep the blind pouch empty of secretions by intermittent or continuous suction as prescribed; monitor its patency closely because clogging from mucus can occur easily.
8. If a gastrostomy tube is inserted, it may be left open so that air entering the stomach through the fistula can escape, minimizing the risk of **regurgitation** of gastric contents into the trachea.
9. Broad-spectrum antibiotics may be prescribed because of the high risk for aspiration pneumonia.

D. Postoperative interventions

1. Monitor vital signs and respiratory status.
2. Maintain IV fluids, antibiotics, and parenteral nutrition as prescribed.
3. Monitor strict intake and output.
4. Monitor daily weight; assess for dehydration and possible fluid overload.
5. Assess for signs of pain.
6. Maintain chest tube if present.
7. Inspect the surgical site for signs and symptoms of infection.
8. Monitor for anastomotic leaks as evidenced by purulent drainage from the chest tube, increased temperature, and increased white blood cell count.
9. If a gastrostomy tube is present, it is usually attached to gravity drainage until the infant can tolerate feedings and the anastomosis is healed (usually postoperative day 5 to 7); then feedings are prescribed.
10. Before oral feedings and removal of the chest tube, prepare for an esophagogram as prescribed to check the integrity of the esophageal anastomosis.

11. Before feeding, elevate the gastrostomy tube and secure it above the level of the stomach to allow gastric secretions to pass to the duodenum and swallowed air to escape through the open gastrostomy tube.
12. Administer oral feedings with sterile water, followed by frequent small feedings of formula as prescribed.
13. Assess the cervical esophagostomy site, if present, for redness, breakdown, or exudate; remove accumulated drainage frequently, and apply protective ointment, barrier dressing, or a collection device as prescribed.
14. Provide nonnutritive sucking, using a pacifier for infants who remain NPO for extended periods (a pacifier should not be used if the infant is unable to handle secretions).
15. Instruct the parents in the techniques of suctioning, gastrostomy tube care and feedings, and skin site care as appropriate.
16. Instruct the parents to identify behaviors that indicate the need for suctioning, signs of respiratory distress, and signs of a constricted esophagus (e.g., poor feeding, dysphagia, drooling, coughing during feedings, regurgitated undigested food).

V. Gastroesophageal Reflux Disease

A. Description

1. Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter.
2. Most infants with gastroesophageal reflux have a mild problem that improves in about 1 year and requires medical therapy only.
3. Gastroesophageal reflux disease occurs when gastric contents reflux into the esophagus or oropharynx and produce symptoms.

B. Assessment

1. Passive **regurgitation** or emesis
2. Poor weight gain
3. Irritability
4. Hematemesis
5. Heartburn (in older children)
6. Anemia from blood loss

C. Interventions

1. Assess amount and characteristics of emesis.
2. Assess the relationship of vomiting to the times of feedings and infant activity.
3. Monitor breath sounds before and after feedings.
4. Assess for signs of aspiration, such as drooling, coughing, or dyspnea, after feeding.
5. Place suction equipment at the bedside.
6. Monitor intake and output.
7. Monitor for signs and symptoms of dehydration.
8. Maintain IV fluids as prescribed.

! **Complications of gastroesophageal reflux disease include esophagitis, esophageal strictures, aspiration of gastric contents, and aspiration pneumonia.**

D. Positioning

1. The infant is placed in the supine position during sleep (to reduce the incidence of sudden infant death syndrome) unless the risk of death from aspiration or other serious complications of gastroesophageal reflux disease greatly outweighs the risks associated with the prone position (check the HCP's prescription); otherwise, the prone position is acceptable only while the infant is awake and can be monitored.
2. In children older than 1 year, position with the head of the bed elevated.

E. Diet

1. Provide small, frequent feedings with predigested formula to decrease the amount of regurgitation.
2. Nutrition via nasogastric tube feedings may be prescribed if severe regurgitation and poor **growth** are present.
3. For infants, formula may be thickened by adding rice cereal to the formula (follow agency procedure); cross-cut the nipple.
4. Breast-feeding may continue, and the mother may provide more frequent feeding times or express milk for thickening with rice **cereal**.
5. Burp the infant frequently when feeding and handle the infant minimally after feedings; monitor for coughing during feeding and other signs of aspiration.
6. For toddlers, feed solids first, followed by liquids.
7. Instruct the parents to avoid feeding the child fatty foods, chocolate, tomato products, carbonated liquids, fruit juices, citrus products, and spicy foods.

8. Instruct the parents that the child should avoid vigorous play after feeding and avoid feeding just before bedtime.

F. Medications

1. Antacids for symptom relief
2. Proton pump inhibitors and histamine H₂-receptor antagonists to decrease gastric acid secretion

VI. Hypertrophic Pyloric Stenosis (Fig. 37-3)

A. Description

1. Hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum.
2. The **stenosis** usually develops in the first few weeks of life, causing projectile vomiting, dehydration, metabolic alkalosis, and failure to thrive.

B. Assessment

1. Vomiting that progresses from mild **regurgitation** to forceful and projectile vomiting; it usually occurs after a feeding.
2. Vomitus contains gastric contents such as milk or formula, may contain mucus, may be blood-tinged, and does not usually contain bile.

FIGURE 37-3 Hypertrophic pyloric stenosis. A, Enlarged muscular area nearly obliterates pyloric channel. B, Longitudinal surgical division of muscle down to submucosa establishes adequate passageway.

3. The child exhibits hunger and irritability.
4. Peristaltic waves are visible from left to right across the epigastrium during or immediately after a feeding.
5. An olive-shaped mass is in the epigastrium just right of the umbilicus.
6. Signs of dehydration and malnutrition
7. Signs of electrolyte imbalances
8. Metabolic alkalosis

C. Interventions

1. Monitor strict intake and output.
2. Monitor vomiting episodes and stools.
3. Obtain daily weights.
4. Monitor for signs of dehydration and electrolyte imbalances.
5. Prepare the child and parents for pyloromyotomy if prescribed.

D. Pyloromyotomy

1. Description: An incision through the muscle fibers of the pylorus; may be performed by laparoscopy
2. Preoperative interventions
 - a. Monitor hydration status by daily weights, intake and output, and urine for specific gravity.
 - b. Correct fluid and electrolyte imbalances; administer fluids intravenously as prescribed for rehydration.
 - c. Maintain NPO status as prescribed.
 - d. Monitor the number and character of stools.
 - e. Maintain patency of the nasogastric tube placed for stomach decompression.
3. Postoperative interventions
 - a. Monitor intake and output.
 - b. Begin small, frequent feedings postoperatively as prescribed.
 - c. Gradually increase amount and interval between feedings until a full feeding schedule has been reinstated.
 - d. Feed the infant slowly, burping frequently, and handle the infant minimally after feedings.
 - e. Monitor for abdominal distention.
 - f. Monitor the surgical wound and for signs of infection.
 - g. Instruct the parents about wound care and feeding.

VII. Lactose Intolerance

A. Description: Inability to tolerate lactose as a result of an absence or deficiency of lactase, an enzyme found in the secretions of the small intestine that is required for the digestion of lactose

B. Assessment

1. Symptoms occur after the ingestion of milk or other dairy products.
2. Abdominal distention

3. Crampy, abdominal pain; colic
4. Diarrhea and excessive flatus

C. Interventions

1. Eliminate the offending dairy product, or administer an enzyme tablet replacement.
2. Provide information to the parents about enzyme tablets that predigest the lactose in dairy products or supplement the body's own lactase.
3. Substitute soy-based formulas for cow's milk formula or human milk.
4. Limit milk consumption to 1 glass at a time.
5. Instruct the child and family that the child should drink milk with other foods rather than by itself.
6. Encourage consumption of hard cheese, cottage cheese, and yogurt, which contain the inactive lactase enzyme.
7. Encourage consumption of small amounts of dairy foods daily to help colonic bacteria adapt to ingested lactose.
8. Instruct the parents about the foods that contain lactose, including hidden sources.

 **A child with lactose intolerance can develop calcium and vitamin D deficiency. Instruct the parents about the importance of providing these supplements.**

VIII. Celiac Disease

A. Description

1. Celiac disease is also known as gluten enteropathy or celiac sprue.
2. Intolerance to gluten, the protein component of wheat, barley, rye, and oats, is characteristic.
3. Celiac disease results in the accumulation of the amino acid glutamine, which is toxic to intestinal mucosal cells.
4. Intestinal villous atrophy occurs, which affects absorption of ingested nutrients.
5. Symptoms of the disorder occur most often between the ages of 1 and 5 years.
6. There is usually an interval of 3 to 6 months between the introduction of gluten in the diet and the onset of symptoms.
7. Strict dietary avoidance of gluten minimizes the risk of developing malignant lymphoma of the small intestine and other gastrointestinal malignancies.

B. Assessment

1. Acute or insidious diarrhea
2. Steatorrhea
3. Anorexia
4. Abdominal pain and distention
5. Muscle wasting, particularly in the buttocks and extremities
6. Vomiting
7. Anemia
8. Irritability

- C. Celiac crisis
 1. Precipitated by fasting, infection, or ingestion of gluten
 2. Causes profuse watery diarrhea and vomiting
 3. Can lead to rapid dehydration, electrolyte imbalance, and severe acidosis
- D. Interventions
 1. Maintain a gluten-free diet, substituting corn, rice, and millet as grain sources.
 2. Instruct the parents and child about lifelong elimination of gluten sources such as wheat, rye, oats, and barley.
 3. Administer mineral and vitamin supplements, including iron, folic acid, and fat-soluble vitamins A, D, E, and K.
 4. Teach the child and parents about a gluten-free diet and about reading food labels carefully for hidden sources of gluten (Box 37-1).
 5. Instruct the parents in measures to prevent celiac crisis.
 6. Inform the parents about the Celiac Sprue Association.

IX. Appendicitis

- A. Description
 1. Inflammation of the appendix
 2. When the appendix becomes inflamed or infected, perforation may occur within a matter of hours, leading to peritonitis, sepsis, septic shock, and potentially death.
 3. Treatment is surgical removal of the appendix before perforation occurs.
- B. Assessment
 1. Pain in periumbilical area that descends to the right lower quadrant
 2. Abdominal pain that is most intense at McBurney's point
 3. Referred pain indicating the presence of peritoneal irritation
 4. Rebound tenderness and abdominal rigidity
 5. Elevated white blood cell count

BOX 37-1 Basics of a Gluten-Free Diet

Foods Allowed

Meat such as beef, pork, poultry, and fish; eggs; milk and some dairy products; vegetables, fruits, rice, corn, gluten-free flour, puffed rice, cornflakes, cornmeal, and precooked gluten-free cereals are allowed.

Foods Prohibited

Commercially prepared ice cream; malted milk; prepared puddings; and grains, including anything made from wheat, rye, oats, or barley, such as breads, rolls, cookies, cakes, crackers, cereal, spaghetti, macaroni noodles, beer, and ale, are prohibited.

6. Side-lying position with abdominal guarding (legs flexed) to relieve pain
 7. Difficulty walking and pain in the right hip
 8. Low-grade fever
 9. Anorexia, nausea, and vomiting after pain develops
 10. Diarrhea
- C. Peritonitis
 1. Description: Results from a perforated appendix
 2. Assessment
 - a. Increased fever
 - b. Progressive abdominal distention
 - c. Tachycardia and tachypnea
 - d. Pallor
 - e. Chills
 - f. Restlessness and irritability

! An indication of a perforated appendix is the sudden relief of pain and then a subsequent increase in pain accompanied by right guarding of the abdomen.
 - D. Appendectomy
 1. Description: Surgical removal of the appendix
 2. Interventions preoperatively
 - a. Maintain NPO status.
 - b. Administer IV fluids and electrolytes as prescribed to prevent dehydration and correct electrolyte imbalances.
 - c. Monitor for changes in the level of pain.
 - d. Monitor for signs of a ruptured appendix and peritonitis.
 - e. Avoid the use of pain medications so as not to mask pain changes associated with perforation.
 - f. Administer antibiotics as prescribed.
 - g. Monitor bowel sounds.
 - h. Position in a right side-lying or low to semi-Fowler's position to promote comfort.
 - i. Apply ice packs to the abdomen for 20 to 30 minutes every hour if prescribed.
 - j. Avoid the application of heat to the abdomen.
 - k. Avoid laxatives or enemas.
 3. Postoperative interventions
 - a. Monitor vital signs, particularly temperature.
 - b. Maintain NPO status until bowel function has returned, advancing the diet gradually as tolerated and as prescribed when bowel sounds return.
 - c. Assess the incision for signs of infection, such as redness, swelling, drainage, and pain.
 - d. Monitor drainage from the drain, which may be inserted if perforation occurred.
 - e. Position the child in a right side-lying or low to semi-Fowler's position with the legs slightly flexed to facilitate drainage.
 - f. Change the dressing as prescribed, and record the type and amount of drainage.

- g. Perform wound irrigations if prescribed.
- h. Maintain nasogastric tube suction and patency of the tube if present.
- i. Administer antibiotics and analgesics as prescribed.

X Hirschsprung's Disease (Fig. 37-4)

A. Description

1. Hirschsprung's disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon.
2. The disease occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine.
3. Mechanical obstruction results because of inadequate motility in an intestinal segment.
4. The disease may be a familial congenital defect or may be associated with other anomalies, such as Down syndrome and genitourinary abnormalities.
5. A rectal biopsy specimen shows histological evidence of the absence of ganglionic cells.
6. The most serious complication is enterocolitis; signs include fever, severe prostration, gastrointestinal bleeding, and explosive watery diarrhea.
7. Treatment for mild or moderate disease is based on relieving the chronic constipation with stool softeners and rectal irrigations; however, many children require surgery.
8. Treatment for moderate to severe disease involves a 2-step surgical procedure.
 - a. Initially, in the neonatal period, a temporary colostomy is created to relieve obstruction and allow the normally innervated, dilated bowel to return to its normal size.
 - b. When the bowel returns to its normal size, a complete surgical repair is performed via a pull-through procedure to excise portions of the bowel; at this time, the colostomy is closed.

FIGURE 37-4 Hirschsprung's disease.

B. Assessment

1. Newborns
 - a. Failure to pass meconium stool
 - b. Refusal to suck
 - c. Abdominal distention
 - d. Bile-stained vomitus
2. Children
 - a. Failure to gain weight and delayed growth
 - b. Abdominal distention
 - c. Vomiting
 - d. Constipation alternating with diarrhea
 - e. Ribbon-like and foul-smelling stools

C. Interventions: Medical management

1. Maintain a low-fiber, high-calorie, high-protein diet; parenteral nutrition may be necessary in extreme situations.
2. Administer stool softeners as prescribed.
3. Administer daily rectal irrigations with normal saline to promote adequate elimination and prevent obstruction as prescribed.

D. Surgical management: Preoperative interventions

1. Assess bowel function.
2. Administer bowel preparation as prescribed.
3. Maintain NPO status.
4. Monitor hydration and fluid and electrolyte status; provide fluids intravenously as prescribed for hydration.
5. Administer antibiotics or colonic irrigations with an antibiotic solution as prescribed to clear the bowel of bacteria.
6. Monitor strict intake and output.
7. Obtain daily weight.
8. Measure abdominal girth daily
9. Avoid taking the temperature rectally.
10. Monitor for respiratory distress associated with abdominal distention.

E. Surgical management: Postoperative interventions

1. Monitor vital signs, avoiding taking the temperature rectally.
2. Measure abdominal girth daily and PRN (as needed).
3. Assess the surgical site for redness, swelling, and drainage.
4. Assess the stoma if present for bleeding or skin breakdown (stoma should be red and moist).
5. Assess the anal area for the presence of stool, redness, or discharge.
6. Maintain NPO status as prescribed and until bowel sounds return or flatus is passed, usually within 48 to 72 hours.
7. Maintain nasogastric tube to allow intermittent suction until peristalsis returns.
8. Maintain IV fluids until the child tolerates appropriate oral intake, advancing the diet from clear liquids to regular as tolerated and as prescribed.
9. Assess for dehydration and fluid overload.
10. Monitor strict intake and output.

11. Obtain daily weight.
12. Assess for pain and provide comfort measures as required.
13. Provide the parents with instructions regarding colostomy care and skin care.
14. Teach the parents about the appropriate diet and the need for adequate fluid intake.

XI. Intussusception (Fig. 37-5)

A. Description

1. Telescoping of one portion of the bowel into another portion
2. The condition results in obstruction to the passage of intestinal contents.

B. Assessment

1. Colicky abdominal pain that causes the child to scream and draw the knees to the abdomen, similar to the fetal position
2. Vomiting of gastric contents
3. Bile-stained fecal emesis
4. Currant jelly–like stools containing blood and mucus
5. Hypoactive or hyperactive bowel sounds
6. Tender distended abdomen, possibly with a palpable sausage-shaped mass in the upper right quadrant

C. Interventions

1. Monitor for signs of perforation and shock as evidenced by fever, increased heart rate, changes in level of consciousness or blood pressure, and respiratory distress, and report immediately.
2. Antibiotics, IV fluids, and decompression via nasogastric tube may be prescribed.

3. Monitor for the passage of normal, brown stool, which indicates that the intussusception has reduced itself.
4. Prepare for hydrostatic reduction as prescribed, if no signs of perforation or shock occur (in hydrostatic reduction, air or fluid is used to exert pressure on area involved to lessen, diminish, or rid the intestine of prolapse).
5. Posthydrostatic reduction
 - a. Monitor for the return of normal bowel sounds, for the passage of barium, and the characteristics of stool.
 - b. Administer clear fluids, and advance the diet gradually as prescribed.
6. If surgery is required, postoperative care is similar to care after any abdominal surgery; procedure may be done via laparoscope.

XII. Abdominal Wall Defects

A. Omphalocele

1. Omphalocele refers to herniation of the abdominal contents through the umbilical ring, usually with an intact peritoneal sac.
2. The protrusion is covered by a translucent sac that may contain bowel or other abdominal organs.
3. Rupture of the sac results in evisceration of the abdominal contents.
4. Immediately after birth, the sac is covered with sterile gauze soaked in normal saline to prevent drying of abdominal contents; a layer of plastic wrap is placed over the gauze to provide additional protection against moisture loss.
5. Monitor vital signs frequently (every 2 to 4 hours), particularly temperature, because the infant can lose heat through the sac.
6. Preoperatively: Maintain NPO status, administer IV fluids as prescribed to maintain hydration and electrolyte balance, monitor for signs of infection, and handle the infant carefully to prevent rupture of the sac.
7. Postoperatively: Control pain, prevent infection, maintain fluid and electrolyte balance, and ensure adequate nutrition.

B. Gastroschisis

1. Gastroschisis occurs when the herniation of the intestine is lateral to the umbilical ring.
2. No membrane covers the exposed bowel.
3. The exposed bowel is covered loosely in saline-soaked pads, and the abdomen is loosely wrapped in a plastic drape or bowel bag; wrapping directly around the exposed bowel is contraindicated because if the exposed bowel expands, wrapping could cause pressure and necrosis.
4. Preoperatively: Care is similar to that for omphalocele; surgery is performed within several hours after birth because no membrane is covering the sac.

FIGURE 37-5 Ileocolic intussusception.

5. Postoperatively: Most infants develop prolonged ileus, require mechanical ventilation, and need parenteral nutrition; otherwise, care is similar to that for omphalocele.

XIII. Umbilical Hernia

A. Description

1. A hernia is a protrusion of the bowel through an abnormal opening in the abdominal wall.
2. In children, hernias most commonly occur at the umbilicus and through the inguinal canal.
3. A hydrocele is the presence of abdominal fluid in the scrotal sac.

B. Assessment

1. Umbilical hernia: Soft swelling or protrusion around the umbilicus that is usually reducible with the finger
2. Inguinal hernia
 - a. Inguinal hernia refers to a painless inguinal swelling that is reducible.
 - b. Swelling may disappear during periods of rest and is most noticeable when the infant cries or coughs.
3. Incarcerated hernia
 - a. Incarcerated hernia occurs when the descended portion of the bowel becomes tightly caught in the hernial sac, compromising blood supply.
 - b. This represents a medical emergency requiring surgical repair.
 - c. Assessment findings include irritability, tenderness at site, anorexia, abdominal distention, and difficulty defecating.
 - d. Complete intestinal obstruction and gangrene may occur.
4. Noncommunicating hydrocele
 - a. Noncommunicating hydrocele occurs when residual peritoneal fluid is trapped with no communication to the peritoneal cavity.
 - b. Hydrocele usually disappears by age 1 year.
5. Communicating hydrocele
 - a. Communicating hydrocele is associated with a hernia that remains open from the scrotum to the abdominal cavity.
 - b. Assessment includes a bulge in the inguinal area or the scrotum that increases with crying or straining and decreases when the infant is at rest.

C. Postoperative interventions (hernia)

1. Monitor vital signs.
2. Assess for wound infection.
3. Monitor for redness or drainage.
4. Monitor input and output and hydration status.
5. Advance the diet as tolerated.
6. Administer analgesics as prescribed.

D. Postoperative interventions (hydrocele)

1. Provide ice bags and a scrotal support to relieve pain and swelling.

2. Instruct the child and parents to avoid tub bathing until the incision heals.
3. Instruct the child and parents to avoid strenuous physical activities.

XIV. Constipation and Encopresis

A. Description

1. Constipation is the infrequent and difficult passage of dry, hard stools.
2. Encopresis is constipation with fecal incontinence; children often complain that soiling is involuntary and occurs without warning.
3. If the child does not have a neurological or anatomical disorder, encopresis is usually the result of fecal impaction and an enlarged rectum caused by chronic constipation.

B. Assessment

1. Constipation
 - a. Abdominal pain and cramping without distention
 - b. Palpable movable fecal masses
 - c. Normal or decreased bowel sounds
 - d. Malaise and headache
 - e. Anorexia, nausea, and vomiting
2. Encopresis
 - a. Evidence of soiling of clothing
 - b. Scratching or rubbing of the anal area
 - c. Fecal odor
 - d. Social withdrawal

C. Interventions

1. Maintain a diet high in fiber and fluids to promote bowel elimination ([Box 37-2](#)).
2. Monitor treatment regimen for severe encopresis for 3 to 6 months.
3. Decrease sugar and milk intake.
4. Administer enemas as prescribed until impaction is cleared.
5. Monitor for hypernatremia or hyperphosphatemia when administering repeated enemas.
 - a. Signs of hypernatremia include increased thirst; dry, sticky mucous membranes; flushed skin; increased temperature; nausea and vomiting; oliguria; and lethargy.
 - b. Signs of hyperphosphatemia include tetany, muscle weakness, dysrhythmias, and hypotension.
6. Administer stool softeners or laxatives as prescribed.
7. Encourage the child to sit on the toilet for 5 to 10 minutes approximately 20 to 30 minutes after breakfast and dinner to assist with defecation.

XV. Irritable Bowel Syndrome

A. Description

1. Irritable bowel syndrome results from increased motility, which can lead to spasm and pain.

BOX 37-2 High-Fiber Foods**Bread and Grains**

- Whole-grain bread or rolls
- Whole-grain cereals
- Bran
- Pancakes, waffles, and muffins with fruit or bran
- Unrefined (brown) rice

Vegetables

- Raw vegetables, especially broccoli, cabbage, carrots, cauliflower, celery, lettuce, and spinach
- Cooked vegetables, including those listed above and asparagus, beans, Brussels sprouts, corn, potatoes, rhubarb, squash, string beans, and turnips

Fruits

- Prunes, raisins, or other dried fruits
- Raw fruits, especially those with skins or seeds, other than ripe banana or avocado

Miscellaneous

- Legumes (beans), popcorn, nuts, and seeds
- High-fiber snack bars

Data from Perry S, Hockenberry M, Lowdermilk D, Wilson D: Maternal-child nursing care, ed 4, St. Louis, 2010, Mosby.

2. The diagnosis is based on the elimination of pathological conditions.
3. The syndrome is a self-limiting, intermittent problem with no definitive treatment.
4. Stress and emotional factors may contribute to its occurrence.

B. Assessment

1. Diffuse abdominal pain unrelated to meals or activity
2. Alternating constipation and diarrhea with the presence of undigested food and mucus in the stool

C. Interventions

1. Reassure the parents and child that the problem is self-limiting and intermittent and will resolve.
2. Anticholinergics may be prescribed (antidepressants may be needed in severe cases).
3. Encourage the maintenance of a healthy, well-balanced, moderate-fiber, and low-fat diet.
4. Encourage health promotion activities such as exercise and school activities.
5. Inform the parents of psychosocial resources if required.

XVI. Imperforate Anus

A. Description: Incomplete development or absence of the anus in its normal position in the perineum

B. Types

1. A membrane is noted over the anal opening, with a normal anus just above the membrane.

BOX 37-3 Assessment Findings: Imperforate Anus

- Failure to pass meconium stool
- Absence or stenosis of the anal rectal canal
- Presence of an anal membrane
- External fistula to the perineum

2. There is complete absence of the anus (anal agenesis) with a rectal pouch ending some distance above.
3. Rectum ends blindly or has a fistula connection to the perineum, urethra, bladder, or vagina.

C. Assessment (Box 37-3)**D. Preoperative interventions**

1. Determine presence of an anal opening.
2. Monitor for the presence of stool in the urine and vagina (indicates a fistula) and report immediately.
3. Administer IV fluids as prescribed.
4. Prepare the child and parents for the surgical procedures, including the potential for colostomy.

E. Postoperative interventions

1. Monitor the skin for signs of infection.
2. The preferred position is a side-lying prone position with the hips elevated or a supine position with the legs suspended at a 90-degree angle to the trunk to reduce edema and pressure on the surgical site.
3. Keep the anal surgical incision clean and dry, and monitor for redness, swelling, or drainage.
4. Maintain NPO status and nasogastric tube if in place.
5. Maintain IV fluids until gastrointestinal motility returns.
6. Provide care for colostomy, if present, as prescribed.
7. A new colostomy stoma may be red and edematous, but this should decrease with time.
8. Instruct the parents to perform anal dilation if prescribed to achieve and maintain bowel patency.
9. Instruct the parents to use only dilators supplied by the HCP and a water-soluble lubricant and to insert the dilator no more than 1 to 2 cm into the anus to prevent damage to the mucosa.

XVII. Hepatitis

A. This section contains specific information regarding hepatitis as it relates to infants and children; see also [Chapters 26](#) and [52](#).

B. Description: An acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process

C. Hepatitis A (HAV)

1. Highest incidence of HAV infection occurs among preschool or school-age children younger than 15 years.
2. Many infected children are asymptomatic, but mild nausea, vomiting, and diarrhea may occur.
3. Infected children who are asymptomatic still can spread HAV to others.

D. Hepatitis B (HBV)

1. Most HBV infection in children is acquired perinatally.
2. Newborns are at risk if the mother is infected with HBV or was a carrier of HBV during pregnancy.
3. Possible routes of maternal-fetal (newborn) transmission include leakage of the virus across the placenta late in pregnancy or during labor, ingestion of amniotic fluid or maternal blood, and breast-feeding, especially if the mother has cracked nipples.
4. The severity in the infant varies from no liver disease to fulminant (severe acute course) or chronic active disease.
5. In children and adolescents, HBV occurs in specific high-risk groups, including children with hemophilia or other disorders requiring multiple blood transfusions, children or adolescents involved in IV drug abuse, institutionalized children, preschool children in endemic areas, and children who have had heterosexual activity or sexual activity with homosexual men.
6. Infection with HBV can cause a carrier state and lead to eventual cirrhosis or hepatocellular carcinoma in adulthood.

E. Hepatitis C (HCV)

1. Transmission of HCV is primarily by the parenteral route.
2. Some children may be asymptomatic, but HCV often becomes a chronic condition and can cause cirrhosis and hepatocellular carcinoma.

F. Hepatitis D

1. Infection occurs in children already infected with HBV.
2. Acute and chronic forms tend to be more severe than HBV and can lead to cirrhosis.
3. Children with hemophilia are more likely to be infected, as are children who are IV drug users.

G. Hepatitis E

1. Infection is uncommon in children.
2. Infection is not a chronic condition, does not cause chronic liver disease, and has no carrier state.

H. Assessment (Box 37-4)

I. Laboratory diagnostic evaluation: See Chapter 52.

J. Prevention

1. Immunoglobulin provides **passive immunity** and may be effective for preexposure prophylaxis to prevent HAV infection.

BOX 37-4 Assessment Findings: Hepatitis

Prodromal or Anicteric Phase

- Lasts 5 to 7 days
- Absence of jaundice
- Anorexia, malaise, lethargy, easy fatigability
- Fever (especially in adolescents)
- Nausea and vomiting
- Epigastric or right upper quadrant abdominal pain
- Arthralgia and rashes (more likely with hepatitis B virus)
- Hepatomegaly

Icteric Phase

- Jaundice, which is best assessed in the sclera, nail beds, and mucous membranes
- Dark urine and pale stools
- Pruritus

2. Hepatitis B immunoglobulin provides passive immunity and may be effective in preventing infection after a 1-time exposure (should be given immediately after exposure), such as an accidental needle puncture or other contact of contaminated material with mucous membranes; immunoglobulin should also be given to newborns whose mothers are positive for hepatitis B surface antigen.
3. Hepatitis A **vaccine** and hepatitis B vaccine: See Chapter 44.

 **Proper hand washing and standard precautions, as well as enteric precautions, can prevent the spread of viral hepatitis.**

K. Interventions

1. Strict hand washing is required.
2. Hospitalization is required in the event of coagulopathy or fulminant hepatitis.
3. Standard precautions and enteric precautions are followed during hospitalization.
4. Provide enteric precautions for at least 1 week after the onset of jaundice with HAV.
5. The hospitalized child usually is not isolated in a separate room unless he or she is fecally incontinent and items are likely to become contaminated with feces.
6. Children are discouraged from sharing toys.
7. Instruct the child and parents in effective hand-washing techniques.
8. Instruct the parents to disinfect diaper-changing surfaces thoroughly with a solution of ¼ cup (60 mL) bleach in 1 gallon (3.8 L) of water.
9. Maintain comfort, and provide adequate rest and sleep.
10. Provide a low-fat, well-balanced diet.
11. In form the parents that because HAV is not infectious 1 week after the onset of jaundice, the child

may return to school at that time if he or she feels well enough.

12. Inform the parents that jaundice may appear worse before it resolves.
13. Caution the parents about administering any medications to the child; explain the role of the liver in detoxification and excretion of medications in understandable terms.
14. Instruct the parents about the signs of the child's condition worsening, such as changes in neurological status, bleeding, and fluid retention.

XVIII. Ingestion of Poisons (see Priority Nursing Actions)

PRIORITY NURSING ACTIONS

Poisoning Treatment in the Emergency Department

1. Assess the child.
2. Terminate exposure to the poison.
3. Identify the poison.
4. Take measures to prevent absorption of the poison.
5. Document the occurrence, assessment findings, poison ingested, treatment measures, and the child's response.

In the event of a poisoning, the nurse treats the child first, not the poison. The ABCs—airway—breathing—circulation—and vital signs are assessed. Cardiopulmonary resuscitation is initiated immediately if necessary. Exposure to the poison is terminated next, such as emptying the mouth of pills or other materials or flushing the skin or other body area. Then, the poison is identified by questioning the parents or witnesses of the event to determine the appropriate treatment. The nurse administers the antidote or takes other measures as prescribed by the health care provider, such as administering activated charcoal. The nurse documents the occurrence, assessment findings, poison ingested, treatment measures, and the child's response.

Reference

Hockenberry, Wilson (2015), p. 548.

A. Lead poisoning

1. Description: Excessive accumulation of lead in the blood
2. Causes
 - a. The pathway for exposure may be food, air, or water.
 - b. Dust and soil contaminated with lead may be a source of exposure.
 - c. Lead enters the child's body through ingestion or inhalation or through placental transmission to an unborn child when the mother is exposed; the most common route is hand to mouth from contaminated objects, such

as loose paint chips, pottery, or ceramic ware coupled with the inhalation of lead dust in the environment.

- d. When lead enters the body, it affects the erythrocytes, bones and teeth, and organs and tissues, including the brain and nervous system; the most serious consequences are the effects on the central nervous system.
3. Universal screening
 - a. Screening is recommended for children 1 to 2 years old; children at high risk should be screened earlier.
 - b. Any child between the ages of 3 and 6 years who has not been screened should be tested.
4. Targeted screening
 - a. Targeted screening is acceptable in low-risk areas.
 - b. A child at the age of 1 to 2 years (or a child between the ages of 3 and 6 years who has not been screened) may be targeted for screening if determined to be at risk.
5. Blood lead level test: Used for screening and diagnosis (Table 37-1)
6. Erythrocyte protoporphyrin test
 - a. Indicator of anemia
 - b. Normal value for a child: 35 mcg/100 mL of whole blood or lower

TABLE 37-1 Blood Lead Level Test Results and Interventions

Level (mcg/dL)	Intervention
< 5	Reassess or rescreen in 1 yr or sooner if exposure status changes
5-14	Provide family lead education, follow-up testing, and social service referral for home assessment if necessary
15-19	Provide family education about lead, follow-up testing, and social service referral if necessary; on follow-up testing, initiate actions for blood lead level of 20-44 mcg/dL (9.7-2.1 mmol/L)
20-44	Provide coordination of care and clinical management, including treatment, environmental investigation, and lead-hazard control
45-69	Provide coordination of care and clinical management within 48 hr, including treatment, environmental investigation, and lead-hazard control (the child must not remain in a lead-hazardous environment if resolution is necessary)
≥70	Medical treatment is provided immediately, including coordination of care, clinical management, environmental investigation, and lead-hazard control

Data from Perry S, Hockenberry M, Lowdermilk D, Wilson D: Maternal-child nursing care, ed 4, St. Louis, 2010, Mosby, and Centers for Disease Control and Prevention: Blood lead levels in children (website): www.cdc.gov/nceh/lead/acclpp/lead_levels_in_children_fact_sheet.pdf. Accessed September 28, 2015.

7. Chelation therapy

- a. Chelation therapy removes lead from the circulating blood and from some organs and tissues.
- b. Therapy does not counteract any effects of the lead.
- c. Medications include calcium disodium edetate, and succimer, an oral preparation; British anti-Lewisite is used in conjunction with EDTA.
- d. British anti-Lewisite is administered via the IV route or the deep intramuscular route and is contraindicated in children with an allergy to peanuts because the medication is prepared in a peanut oil solution; it is also contraindicated in children with glucose-6-phosphate dehydrogenase (G6PD) deficiency and should not be given with iron.
- e. The function of the renal, hepatic, and hematological systems must be monitored closely.
- f. Ensure adequate urinary output before administering the medication, and monitor the output and pH of the urine closely during and after therapy.
- g. Provide adequate hydration and monitor kidney function for nephrotoxicity when the medication is given because the medication is excreted via the kidneys.
- h. Follow-up of lead levels needs to be done to monitor progress.
- i. Provide instructions to parents about safety from lead hazards, medication administration, and the need for follow-up.
- j. Confirm that the child will be discharged to a home without lead hazards.

B. Acetaminophen

1. Description

- a. Seriousness of ingestion is determined by the amount ingested and the length of time before intervention.
- b. Toxic dose is 150 mg/kg or higher in children.

2. Assessment

- a. First 2 to 4 hours: Malaise, nausea, vomiting, sweating, pallor, weakness
- b. Latent period: 24 to 36 hours; child improves
- c. Hepatic involvement: May last 7 days and may be permanent; right upper quadrant pain, jaundice, confusion, stupor, elevated liver enzyme and bilirubin levels, prolonged prothrombin time

3. Interventions

- a. Administer antidote: N-Acetylcysteine.
- b. Dilute antidote in juice or soda because of its offensive odor.
- c. Loading dose is followed by maintenance doses.

- d. In an unconscious child, prepare to administer gastric lavage with activated charcoal to decrease the absorption of acetaminophen.
- e. If using activated charcoal with lavage, do not also use N-acetylcysteine because activated charcoal inactivates the antidote.

C. Acetylsalicylic acid (aspirin)

1. Description

- a. Overdose may be caused by acute ingestion or chronic ingestion.
- b. Acute: Severe toxicity with 300 to 500 mg/kg
- c. Chronic: Ingestion of more than 100 mg/kg per day for 2 days or more, which can be more serious than acute ingestion

2. Assessment

- a. Gastrointestinal effects: Nausea, vomiting, and thirst from dehydration
- b. Central nervous system effects: Hyperpnea, confusion, tinnitus, seizures, coma, respiratory failure, circulatory collapse
- c. Renal effects: Oliguria
- d. Hematopoietic effects: Bleeding tendencies
- e. Metabolic effects: Diaphoresis, fever, hyponatremia, hypokalemia, dehydration, hypoglycemia, metabolic acidosis

3. Interventions

- a. Prepare to administer activated charcoal to decrease absorption of salicylate.
- b. Emesis or cathartic measures may be prescribed.
- c. Administer IV fluids; sodium bicarbonate may be prescribed to correct metabolic acidosis.
- d. Other interventions include external cooling, anticonvulsants, vitamin K (if bleeding), and oxygen.
- e. Prepare the child for dialysis as prescribed if the child is unresponsive to the therapy.

D. Corrosives

1. Description

- a. Items that can cause poisoning include household cleaners, detergents, bleach, paint or paint thinners, and batteries.
- b. Liquid corrosives can cause more damage to the victim than other types of corrosives, such as granular.

2. Assessment

- a. Severe burning in the mouth, throat, or stomach
- b. Edema of the mucous membranes, lips, tongue, and pharynx
- c. Vomiting
- d. Drooling and inability to clear secretions

3. Interventions

- a. Dilute corrosive with water or milk as prescribed (usually no more than 4 oz [120 mL])
- b. Inducing vomiting is contraindicated because vomiting redamages the mucous membranes.

- c. Neutralization of the ingested corrosive is not done because it can cause a reaction producing heat and burns.

! Educate parents to call the Poison Control Center immediately in the event of poisoning. The parents need to post the Poison Control Center telephone number near each phone in the house and have it in their mobile phones.

XIX. Intestinal Parasites

- A. Description: Common infections in children are giardiasis and pinworm infestation.
1. Giardiasis is caused by protozoa and is prevalent among children in crowded environments, such as classrooms or day care centers.
 2. Pinworms (enterobiasis) are universally present in temperate climate zones and are easily transmitted in crowded environments.
- B. Assessment
1. Giardiasis
 - a. Diarrhea and vomiting
 - b. Anorexia
 - c. Failure to thrive
 - d. Abdominal cramps with intermittent loose stools and constipation
 - e. Steatorrhea
 - f. Stool specimens from 3 or more collections are used for diagnosis.
 2. Pinworms
 - a. Intense perianal itching
 - b. Irritability, restlessness
 - c. Poor sleeping
 - d. Bed wetting
- C. Interventions
1. Giardiasis
 - a. Medications that kill the parasites may be prescribed; medications are not usually prescribed for children younger than 2 years.
 - b. Caregivers should wash hands meticulously.
 - c. Provide education to family and caregivers regarding sanitary practices.
 2. Pinworms
 - a. Perform a visual inspection of the anus with a flashlight 2 to 3 hours after sleep.
 - b. The tape test is the most common diagnostic test.
 - c. Educate the family and caregivers regarding the tape test. A loop of transparent tape is placed firmly against the child's perianal area; it is removed in the morning and placed in a glass jar or plastic bag and transported to the laboratory for analysis.
 - d. Medications that kill the parasites may be prescribed; medications are not usually prescribed for children younger than 2 years.
 - e. The medication regimen may be repeated in 2 weeks to prevent reinfection.
 - f. All members of the family are treated for the infection.
 - g. Teach the family and caregivers about the importance of meticulous hand washing and about washing all clothes and bed linens in hot water.

CRITICAL THINKING What Should You Do?

Answer: If a child suddenly vomits, the nurse must maintain a patent airway. The child should be positioned upright or on the side to prevent aspiration. Suctioning equipment should be obtained and kept at the bedside. The nurse should check the character and amount of the vomitus. The force of the vomiting should be assessed because projectile vomiting may indicate pyloric stenosis or increased intracranial pressure. The nurse should also monitor intake and output and for signs of dehydration.

References: Hockenberry, Wilson (2015), p. 1068.
McKinney et al. (2013), pp. 1004-1005.

PRACTICE QUESTIONS

382. The clinic nurse reviews the record of an infant and notes that the health care provider has documented a diagnosis of suspected Hirschsprung's disease. The nurse reviews the assessment findings documented in the record, knowing that which sign most likely led the mother to seek health care for the infant?
1. Diarrhea
 2. Projectile vomiting
 3. Regurgitation of feedings
 4. Foul-smelling ribbon-like stools
383. An infant has just returned to the nursing unit after surgical repair of a cleft lip on the right side. The nurse should place the infant in which best position at this time?
1. Prone position
 2. On the stomach
 3. Left lateral position
 4. Right lateral position
384. The nurse reviews the record of a newborn infant and notes that a diagnosis of esophageal atresia with tracheoesophageal fistula is suspected. The nurse expects to note which most likely sign of this condition documented in the record?
1. Incessant crying
 2. Coughing at nighttime
 3. Choking with feedings
 4. Severe projectile vomiting

385. The nurse provides feeding instructions to a parent of an infant diagnosed with gastroesophageal reflux disease. Which instruction should the nurse give to the parent to assist in reducing the episodes of emesis?
1. Provide less frequent, larger feedings.
 2. Burp the infant less frequently during feedings.
 3. Thin the feedings by adding water to the formula.
 4. Thicken the feedings by adding rice cereal to the formula.
386. A child is hospitalized because of persistent vomiting. The nurse should monitor the child closely for which problem?
1. Diarrhea
 2. Metabolic acidosis
 3. Metabolic alkalosis
 4. Hyperactive bowel sounds
387. The nurse is caring for a newborn with a suspected diagnosis of imperforate anus. The nurse monitors the infant, knowing that which is a clinical manifestation associated with this disorder?
1. Bile-stained fecal emesis
 2. The passage of currant jelly–like stools
 3. Failure to pass meconium stool in the first 24 hours after birth
 4. Sausage-shaped mass palpated in the upper right abdominal quadrant
388. The nurse admits a child to the hospital with a diagnosis of pyloric stenosis. On assessment, which data would the nurse expect to obtain when asking the parent about the child's symptoms?
1. Watery diarrhea
 2. Projectile vomiting
 3. Increased urine output
 4. Vomiting large amounts of bile
389. The nurse provides home care instructions to the parents of a child with celiac disease. The nurse should teach the parents to include which food item in the child's diet?
1. Rice
 2. Oatmeal
 3. Rye toast
 4. Wheat bread
390. The nurse is preparing to care for a child with a diagnosis of intussusception. The nurse reviews the child's record and expects to note which sign of this disorder documented?
1. Watery diarrhea
 2. Ribbon-like stools
 3. Profuse projectile vomiting
 4. Bright red blood and mucus in the stools
- ❖ 391. Which interventions should the nurse include when creating a care plan for a child with hepatitis? Select all that apply.
- 1. Providing a low-fat, well-balanced diet.
 - 2. Teaching the child effective hand-washing techniques.
 - 3. Scheduling playtime in the playroom with other children.
 - 4. Notifying the health care provider (HCP) if jaundice is present.
 - 5. Instructing the parents to avoid administering medications unless prescribed.
 - 6. Arranging for indefinite home schooling because the child will not be able to return to school.

ANSWERS

382. 4

Rationale: Hirschsprung's disease is a congenital anomaly also known as congenital aganglionosis or aganglionic megacolon. It occurs as the result of an absence of ganglion cells in the rectum and other areas of the affected intestine. Chronic constipation beginning in the first month of life and resulting in pellet-like or ribbon-like stools that are foul-smelling is a clinical manifestation of this disorder. Delayed passage or absence of meconium stool in the neonatal period is also a sign. Bowel obstruction, especially in the neonatal period; abdominal pain and distention; and failure to thrive are also clinical manifestations. Options 1, 2, and 3 are not associated specifically with this disorder.

Test-Taking Strategy: Note the **strategic words**, most likely. Use knowledge regarding the pathophysiology associated with Hirschsprung's disease to direct you to the correct option. Remember that chronic constipation beginning in the first

month of life and resulting in pellet-like or ribbon-like, foul-smelling stools is a clinical manifestation of this disorder.

Review: **Hirschsprung's disease**

Level of Cognitive Ability: Analyzing

Content Area: Pediatrics—Gastrointestinal

Priority Concepts: Clinical Judgment; Elimination

Reference: Hockenberry, Wilson (2015), p. 1074.

383. 3

Rationale: A cleft lip is a congenital anomaly that occurs as a result of failure of soft tissue or bony structure to fuse during embryonic development. After cleft lip repair, the nurse avoids positioning an infant on the side of the repair or in the prone position because these positions can cause rubbing of the surgical site on the mattress. The nurse positions the infant on the side lateral to the repair or on the back upright and positions

the infant to prevent airway obstruction by secretions, blood, or the tongue. From the options provided, placing the infant on the left side immediately after surgery is best to prevent the risk of aspiration if the infant vomits.

Test-Taking Strategy: Note the **strategic word**, best. Eliminate options 1 and 2 because they are comparable or alike positions. Consider the anatomical location of the surgical site and note the words right side in the question to direct you to the correct option from those remaining.

Review: Positioning guidelines following **cleft lip repair**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Gastrointestinal

Priority Concepts: Safety; Tissue Integrity

Reference: Hockenberry, Wilson (2015), pp. 305, 309.

384. 3

Rationale: In esophageal atresia and tracheoesophageal fistula, the esophagus terminates before it reaches the stomach, ending in a blind pouch, and a fistula is present that forms an unnatural connection with the trachea. Any child who exhibits the “3 Cs”—coughing and choking with feedings and unexplained cyanosis—should be suspected to have tracheoesophageal fistula. Options 1, 2, and 4 are not specifically associated with tracheoesophageal fistula.

Test-Taking Strategy: Note the **strategic words**, most likely. Focus on the diagnosis and think about the pathophysiology of the disorder. Recalling the “3 Cs” associated with this disorder will assist in directing you to the correct option.

Review: **Tracheoesophageal fistula**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Gastrointestinal

Priority Concepts: Clinical Judgment; Tissue Integrity

Reference: Hockenberry, Wilson (2015), p. 1108.

385. 4

Rationale: Gastroesophageal reflux is backflow of gastric contents into the esophagus as a result of relaxation or incompetence of the lower esophageal or cardiac sphincter. Small, more frequent feedings with frequent burping often are prescribed in the treatment of gastroesophageal reflux. Feedings thickened with rice cereal may reduce episodes of emesis. If thickened formula is used, cross-cutting of the nipple may be required.

Test-Taking Strategy: Note the **subject**, gastroesophageal reflux disease. Use basic principles related to feeding an infant to assist in eliminating options 1 and 2. Noting the words reducing the episodes of emesis in the question will assist in directing you to select the correct option over option 3.

Review: **Gastroesophageal reflux disease**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Teaching and Learning

Content Area: Pediatrics—Gastrointestinal

Priority Concepts: Client Education; Nutrition

Reference: Hockenberry, Wilson (2015), pp. 1076-1077.

386. 3

Rationale: Vomiting causes the loss of hydrochloric acid and subsequent metabolic alkalosis. Metabolic acidosis would occur in a child experiencing diarrhea because of the loss of bicarbonate. Diarrhea might or might not accompany vomiting. Hyperactive bowel sounds are not associated with vomiting.

Test-Taking Strategy: Focus on the **subject**, complications related to vomiting. Recalling that gastric fluids are acidic and that the loss of these fluids leads to alkalosis will assist you in answering the question. No data in the question support options 1 and 4.

Review: **Fluid and electrolyte balance** and **vomiting**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Gastrointestinal

Priority Concepts: Acid-Base Balance; Fluid and Electrolyte Balance

Reference: Hockenberry, Wilson (2015), p. 1132.

387. 3

Rationale: Imperforate anus is the incomplete development or absence of the anus in its normal position in the perineum. During the newborn assessment, this defect should be identified easily on sight. However, a rectal thermometer or tube may be necessary to determine patency if meconium is not passed in the first 24 hours after birth. Other assessment findings include absence or stenosis of the anal rectal canal, presence of an anal membrane, and an external fistula to the perineum. Options 1, 2, and 4 are findings noted in intussusception.

Test-Taking Strategy: Note the **subject**, manifestations of imperforate anus. Use the definition of the word imperforate to assist in answering this question. This should direct you to the correct option.

Review: **Imperforate anus**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Gastrointestinal

Priority Concepts: Clinical Judgment; Elimination

Reference: Hockenberry, Wilson (2015), p. 1117.

388. 2

Rationale: In pyloric stenosis, hypertrophy of the circular muscles of the pylorus causes narrowing of the pyloric canal between the stomach and the duodenum. Clinical manifestations of pyloric stenosis include projectile vomiting, irritability, hunger and crying, constipation, and signs of dehydration, including a decrease in urine output.

Test-Taking Strategy: Focus on the **subject**, the manifestations of pyloric stenosis. Considering the anatomical location of this disorder and its potential effects will assist in eliminating options 1 and 3. Thinking about the pathophysiology of the disorder and recalling that a major clinical manifestation is projectile vomiting will assist in directing you to the correct option from those remaining.

Review: **Pyloric stenosis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment
 Content Area: Pediatrics—Gastrointestinal
 Priority Concepts: Clinical Judgment; Nutrition
 Reference: Hockenberry, Wilson (2015), p. 1091.

389. 1

Rationale: Celiac disease also is known as gluten enteropathy or celiac sprue and refers to intolerance to gluten, the protein component of wheat, barley, rye, and oats. The important factor to remember is that all wheat, rye, barley, and oats should be eliminated from the diet and replaced with corn, rice, or millet. Vitamin supplements—especially the fat-soluble vitamins, iron, and folic acid—may be needed to correct deficiencies. Dietary restrictions are likely to be lifelong.

Test-Taking Strategy: Focus on the **subject**, home care instructions for the child with celiac disease. Recalling that corn, rice, and millet are substitute food replacements in this disease will direct you to the correct option.

Review: **Celiac disease**

Level of Cognitive Ability: Applying
 Client Needs: Health Promotion and Maintenance
 Integrated Process: Teaching and Learning
 Content Area: Pediatrics—Gastrointestinal
 Priority Concepts: Client Education; Nutrition
 Reference: Hockenberry, Wilson (2015), p. 1096.

390. 4

Rationale: Intussusception is a telescoping of 1 portion of the bowel into another. The condition results in an obstruction to the passage of intestinal contents. A child with intussusception typically has severe abdominal pain that is crampy and intermittent, causing the child to draw in the knees to the chest. Vomiting may be present, but is not projectile. Bright red blood and mucus are passed through the rectum and commonly are described as currant jelly–like stools. Watery diarrhea and ribbon-like stools are not manifestations of this disorder.

Test-Taking Strategy: Focus on the **subject**, the manifestations of intussusception. Think about the pathophysiology associated with this condition. Recalling that a classic manifestation is currant jelly–like stools will assist in directing you to the correct option.

Review: **Intussusception**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Pediatrics—Gastrointestinal
 Priority Concepts: Clinical Judgment; Elimination
 Reference: Hockenberry, Wilson (2015), p. 1094.

❖ 391. 1, 2, 5

Rationale: Hepatitis is an acute or chronic inflammation of the liver that may be caused by a virus, a medication reaction, or another disease process. Because hepatitis can be viral, standard precautions should be instituted in the hospital. The child should be discouraged from sharing toys, so playtime in the playroom with other children is not part of the plan of care. The child will be allowed to return to school 1 week after the onset of jaundice, so indefinite home schooling would not need to be arranged. Jaundice is an expected finding with hepatitis and would not warrant notification of the HCP. Provision of a low-fat, well-balanced diet is recommended. Parents are cautioned about administering any medication to the child because normal doses of many medications may become dangerous owing to the liver's inability to detoxify and excrete them. Hand washing is the most effective measure for control of hepatitis in any setting, and effective hand washing can prevent the immunocompromised child from contracting an opportunistic type of infection.

Test-Taking Strategy: Focus on the **subject**, care for a child with hepatitis. Thinking about the pathophysiology associated with hepatitis and the method of transmission will assist you in answering the question. Because the infection can be transmitted to others, playing with other children in the playroom is not an appropriate intervention. Since jaundice is an expected finding, notifying the HCP is unnecessary. Planning for an indefinite period of home schooling is not necessary.

Review: **Hepatitis**

Eye, Ear, and Throat Disorders

PRIORITY CONCEPTS Safety; Sensory Perception

CRITICAL THINKING What Should You Do?

An adolescent has just been diagnosed with bacterial conjunctivitis. What should the nurse do?

Answer located on p. 459.

I. Strabismus

A. Description

1. Called “squint” or “cross-eye”
2. Condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles
3. Most often results from muscle imbalance or paralysis of extraocular muscles, but also may result from a congenital defect
4. Amblyopia (reduced visual acuity) may occur if not treated early because the brain receives 2 messages as a result of the nonparallel visual axes.
5. Permanent loss of vision can occur if not treated early.
6. This condition, considered a normal finding in a young infant, should not be present after about age 4 months.
7. Treatment of the condition depends on the cause.

B. Assessment

1. Crossed eyes
2. Squinting; tilts the head or closes 1 eye to see
3. Loss of binocular vision
4. Impairment of depth perception
5. Frequent headaches
6. Diplopia; photophobia

C. Interventions

1. Corrective lenses may be indicated.
2. Instruct the parents regarding patching (occlusion therapy) of the “good” eye to strengthen the weak eye.
3. Prepare for surgery to realign the weak muscles as prescribed if nonsurgical interventions are

unsuccessful; this is usually performed before age 2 years.

4. Instruct the parents about the need for follow-up visits.

II. Conjunctivitis

A. Description

1. Also known as “pink eye”; an inflammation of the conjunctiva
2. Conjunctivitis usually is caused by allergy, infection, or trauma.
3. Bacterial or viral conjunctivitis is extremely contagious.

B. Assessment

1. Itching, burning, or scratchy eyelids
2. Redness
3. Edema
4. Discharge

! Chlamydial conjunctivitis is rare in older children; if diagnosed in a child who is not sexually active, the child should be assessed for possible sexual abuse.

C. Interventions

1. Instruct in infection control measures such as good hand washing and not sharing towels and washcloths.
2. Administer antibiotic or antiviral eye drops or ointment as prescribed if infection is present (severe infection may require therapy with systemic antibiotics).
3. Instruct the child and parents about the administration of the prescribed medications.
4. Instruct the parents that the child should be kept home from school or day care until antibiotics have been administered for 24 hours.
5. Instruct the child to avoid rubbing the eye to prevent injury.
6. Instruct a child who is wearing contact lenses to discontinue wearing them and to obtain new lenses to eliminate the chance of reinfection that can occur from use of the old lenses.

- Instruct an adolescent that eye makeup should be discarded and replaced.

III. Otitis Media

A. Description

- An inflammatory disorder usually caused by an infection of the middle ear occurring as a result of a blocked eustachian tube, which prevents normal drainage; can be acute or chronic.
- Otitis media is a common complication of an acute respiratory infection (most commonly from respiratory syncytial virus or influenza).
- Infants and children have eustachian tubes that are shorter, wider, and straighter, which makes them more prone to otitis media.

B. Prevention

- Feed infants in upright position, to prevent reflux.
- Maintain routine immunizations.
- Encourage breast-feeding for at least the first 6 months of life.
- Avoid exposure to tobacco smoke and allergens.

C. Assessment

- Fever
- Acute onset of ear pain
- Crying, irritability, lethargy
- Loss of appetite
- Rolling of head from side to side
- Pulling on or rubbing the ear
- Purulent ear drainage may be present
- Red, opaque, bulging, immobile tympanic membrane on otoscopic examination
- Signs of hearing loss (indicative of chronic otitis media)

D. Interventions

- Encourage fluid intake (may be difficult if the child is in pain).
- Instruct the child to avoid chewing as much as possible during the acute period because chewing increases pain.
- Provide local heat or cold as prescribed to relieve discomfort, and have the child lie with the affected ear down.
- Instruct the parents in the appropriate procedure to clean drainage from the external ear canal with sterile swabs or gauze; frequent cleansing and the application of moisture barriers may be prescribed to prevent ear excoriation from the drainage.
- Instruct the parents in the administration of analgesics or antipyretics such as acetaminophen or ibuprofen as prescribed to decrease fever and pain.
- Instruct the parents in the administration of antibiotics if prescribed, emphasizing that the

prescribed period of administration is necessary to eliminate infective organisms.

- In healthy infants over 6 months and children, careful use of antibiotics is recommended because of concerns about medication-resistant *Streptococcus pneumoniae*; usually, waiting up to 72 hours for spontaneous resolution is a safe and appropriate management of acute otitis media.
- Instruct the parents that screening for hearing loss may be necessary.
- Instruct the parents about the procedure for administering ear medications such as topical pain-relief drops, if prescribed.

 **To administer ear medications in a child younger than age 3 years, pull the earlobe down and back. In a child older than 3 years, pull the pinna up and back.**

E. Myringotomy

1. Description

- A surgical incision into the tympanic membrane to provide drainage of the purulent middle ear fluid; may be done by a laser-assisted procedure
- Tympanoplasty tubes, which are small cylinder-shaped tubes, may be inserted into the middle ear to allow continued drainage and to equalize pressure and allow ventilation of the middle ear.

2. Postoperative interventions

- Instruct the parents and child to keep the ears dry.
- The client should wear earplugs while bathing, shampooing, and swimming (diving and submerging under water are not allowed).
- Parents can administer an analgesic such as acetaminophen or ibuprofen to relieve discomfort after insertion of tympanoplasty tubes.
- Parents should be taught that the child should not blow his or her nose for 7 to 10 days after surgery.
- Instruct the parents that if the tubes fall out, it is not an emergency, but the health care provider (HCP) should be notified; inform the parents of the appearance of the tubes (tiny, white, spool-shaped tubes).

IV. Tonsillitis and Adenoiditis

A. Description

- Tonsillitis refers to inflammation and infection of the tonsils, which is lymphoid tissue located in the pharynx (Fig. 38-1).

FIGURE 38-1 Location of various tonsillar masses.

2. Adenoiditis refers to inflammation and infection of the adenoids (pharyngeal tonsils), located on the posterior wall of the nasopharynx.
3. Tonsillectomy (surgical removal of the tonsils) and adenoidectomy (surgical removal of the adenoids) may be necessary.

B. Assessment

1. Persistent or recurrent sore throat
2. Enlarged, bright red tonsils that may be covered with white exudate
3. Difficulty in swallowing
4. Mouth breathing and an unpleasant mouth odor
5. Fever
6. Cough
7. Enlarged adenoids may cause nasal quality of speech, mouth breathing, hearing difficulty, snoring, or obstructive sleep apnea.

C. Preoperative interventions

1. Assess for signs of active infection.
2. Assess bleeding and clotting studies because the throat is vascular.
3. Prepare the child for a sore throat postoperatively, and inform the child that he or she will need to drink liquids.
4. Assess for any loose teeth to decrease the risk of aspiration during surgery.

D. Interventions postoperatively

1. Position the child prone or side-lying to facilitate drainage.
2. Have suction equipment available, but do not suction unless there is an airway obstruction.
3. Monitor for signs of bleeding (frequent swallowing may indicate bleeding); if bleeding occurs, turn the child to the side and notify the HCP.
4. Discourage coughing, clearing the throat, or nose blowing to prevent bleeding.

5. Provide an ice collar or analgesics (rectally or intravenously) for discomfort.
6. Administer antiemetics to prevent vomiting if prescribed.
7. Provide clear, cool, noncitrus and noncarbonated fluids (crushed ice, ice pops).
8. Avoid red, purple, or brown liquids, which simulate the appearance of blood if the child vomits.
9. Avoid milk products such as milk, ice cream, and pudding initially because they coat the throat, causing the child to cough to clear the throat.
10. Soft foods may be prescribed 1 to 2 days postoperatively.
11. Do not give the child any straws, forks, or sharp objects that can be put into the mouth.
12. Mouth odor, slight ear pain, and a low-grade fever may occur for a few days postoperatively, but the parents should be instructed to notify the HCP if bleeding, persistent earache, or fever occurs.
13. Instruct the parents to keep the child away from crowds until healing has occurred; usually the child is able to resume normal activities 1 to 2 weeks postoperatively.

V. Epistaxis (Nosebleed)

A. Description

1. The nose, especially the septum, is a highly vascular structure, and bleeding usually results from direct trauma, foreign bodies, and nose picking or from mucosal inflammation.
2. Recurrent epistaxis and severe bleeding may indicate an underlying disease.

B. Interventions

1. See Priority Nursing Actions.
2. If bleeding cannot be controlled, packing or cauterization of the bleeding vessel may be prescribed.

CRITICAL THINKING What Should You Do?

Answer: Bacterial conjunctivitis is contagious, so the nurse should immediately institute measures to prevent the spread of the infection to others. The nurse should also teach the adolescent about measures to prevent the spread of infection. These and other measures include good infection control measures such as hand washing and not sharing towels and washcloths, the procedure for administering antibiotic eye drops or ointment as prescribed, staying home from school until antibiotics have been administered for 24 hours, wearing dark glasses if photophobia occurs, avoiding rubbing the eye to prevent injury, discontinuing wearing eye contacts and obtaining new lenses to eliminate the chance of reinfection, and discarding and replacing eye makeup.

Reference: Hockenberry, Wilson (2015), p. 221.

⚡ PRIORITY NURSING ACTIONS

A Child Has a Nosebleed

1. Remain calm and keep the child calm and quiet.
2. Have the child sit up and lean forward (not lie down).
3. Apply continuous pressure to the nose with the thumb and forefinger for at least 10 minutes.
4. Insert cotton or wadded tissue into each nostril, and apply ice or a cold cloth to the bridge of the nose if bleeding persists.

If a nosebleed occurs in a child, it is important for the nurse to remain calm; otherwise, the child becomes agitated and it is difficult to get the child to cooperate with the necessary interventions. The child should be assisted to a sitting up and leaning forward position to prevent aspiration of blood. The child should not be placed in a lying down position because of the risk of aspiration. Nosebleeds usually originate in the anterior part of the nasal septum and can be controlled by applying pressure to the soft lower portion of the nose with the thumb and forefinger for at least 10 minutes. If bleeding persists, cotton or wadded tissue should be placed into each nostril, and ice or a cold cloth should be applied to the bridge of the nose. In addition, if bleeding persists, the health care provider (HCP) needs to be notified, and the nose may require packing by the HCP. After the nosebleed has been stopped, petroleum or a water-soluble jelly may be inserted into each nostril to prevent crusting of old blood and to lessen the likelihood of the child picking at the crusted lesions and restarting the bleeding. Repeated bleeding episodes that last longer than 30 minutes may be an indication of the need for evaluation of a bleeding disorder.

Reference

Hockenberry, Wilson (2015), p. 1362.

PRACTICE QUESTIONS

392. After a tonsillectomy, a child begins to vomit bright red blood. The nurse should take which initial action?
 1. Turn the child to the side.
 2. Administer the prescribed antiemetic.
 3. Notify the health care provider (HCP).
 4. Maintain NPO (nothing by mouth) status.
393. The mother of a 6-year-old child arrives at a clinic because the child has been experiencing itchy, red, and swollen eyes. The nurse notes a discharge from the eyes and sends a culture to the laboratory for analysis. Chlamydial conjunctivitis is diagnosed. On the basis of this diagnosis, the nurse determines that which requires further investigation?
 1. Possible trauma
 2. Possible sexual abuse
 3. Presence of an allergy
 4. Presence of a respiratory infection
394. The nurse prepares a teaching plan for the mother of a child diagnosed with bacterial conjunctivitis. Which, if stated by the mother, indicates a need for further teaching?
 1. "I need to wash my hands frequently."
 2. "I need to clean the eye as prescribed."
 3. "It is okay to share towels and washcloths."
 4. "I need to give the eye drops as prescribed."
395. The nurse is reviewing the laboratory results for a child scheduled for a tonsillectomy. The nurse determines that which laboratory value is most significant to review?
 1. Creatinine level
 2. Prothrombin time
 3. Sedimentation rate
 4. Blood urea nitrogen level
396. The nurse is preparing to care for a child after a tonsillectomy. The nurse documents on the plan of care to place the child in which position?
 1. Supine
 2. Side-lying
 3. High Fowler's
 4. Trendelenburg
397. After a tonsillectomy, the nurse reviews the health care provider's (HCP's) postoperative prescriptions. Which prescription should the nurse question?
 1. Monitor for bleeding.
 2. Suction every 2 hours.
 3. Give no milk or milk products.
 4. Give clear, cool liquids when awake and alert.
398. The nurse is caring for a child after a tonsillectomy. The nurse monitors the child, knowing that which finding indicates the child is bleeding?
 1. Frequent swallowing
 2. A decreased pulse rate
 3. Complaints of discomfort
 4. An elevation in blood pressure
399. Antibiotics are prescribed for a child with otitis media who underwent a myringotomy with insertion of tympanostomy tubes. The nurse provides discharge instructions to the parents regarding the administration of the antibiotics. Which statement, if made by the parents, indicates understanding of the instructions provided?
 1. "Administer the antibiotics until they are gone."
 2. "Administer the antibiotics if the child has a fever."
 3. "Administer the antibiotics until the child feels better."
 4. "Begin to taper the antibiotics after 3 days of a full course."

400. The day care nurse is observing a 2-year-old child and suspects that the child may have strabismus. Which observation made by the nurse indicates the presence of this condition?
1. The child has difficulty hearing.
 2. The child consistently tilts the head to see.
 3. The child does not respond when spoken to.
 4. The child consistently turns the head to hear.
- ❖ 401. A child has been diagnosed with acute otitis media of the right ear. Which interventions should the nurse include in the plan of care? Select all that apply.
- 1. Provide a soft diet.
 - 2. Position the child on the left side.
 - 3. Administer an antihistamine twice daily.
 - 4. Irrigate the right ear with normal saline every 8 hours.
 - 5. Administer ibuprofen for fever every 4 hours as prescribed and as needed.
 - 6. Instruct the parents about the need to administer the prescribed antibiotics for the full course of therapy.

ANSWERS

392. 1

Rationale: After tonsillectomy, if bleeding occurs, the nurse immediately turns the child to the side to prevent aspiration and then notifies the HCP. NPO status would be maintained, and an antiemetic may be prescribed; however, the initial nursing action would be to turn the child to the side.

Test-Taking Strategy: Note the **strategic word**, initial. Although all of the options may be appropriate to maintain physiological integrity, the initial action is to turn the child to the side to prevent aspiration.

Review: **Tonsillectomy**

Level of Cognitive Ability: Applying

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Implementation

Content Area: Pediatrics—Throat/Respiratory

Priority Concepts: Clinical Judgment; Safety

Reference: McKinney et al. (2013), p. 1158.

393. 2

Rationale: Conjunctivitis is an inflammation of the conjunctiva. A diagnosis of chlamydial conjunctivitis in a child who is not sexually active should signal the health care provider to assess the child for possible sexual abuse. Trauma, allergy, and infection can cause conjunctivitis, but the causative organism is not likely to be Chlamydia.

Test-Taking Strategy: Note the age of the child and the organism that is identified in the question. Also note that options 1, 3, and 4 are **comparable or alike** in that they can be recognized as the common causes of conjunctivitis and they relate to a physiological problem.

Review: Causes of **chlamydial conjunctivitis**

Level of Cognitive Ability: Analyzing

Client Needs: Psychosocial Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Infectious and Communicable Diseases

Priority Concepts: Clinical Judgment; Infection

References: Hockenberry, Wilson (2015), p. 562.

McKinney et al. (2013), pp. 1508-1509.

394. 3

Rationale: Conjunctivitis is an inflammation of the conjunctiva. Bacterial conjunctivitis is highly contagious, and the nurse should teach infection control measures. These include good hand washing and not sharing towels and washcloths. Options 1, 2, and 4 are correct treatment measures.

Test-Taking Strategy: Note the **strategic words**, need for further teaching. These words indicate a **negative event query** and ask you to select an option that is an incorrect statement. Options 1, 2, and 4 can be eliminated by recalling that bacterial conjunctivitis is highly contagious.

Review: Infection control measures for **bacterial conjunctivitis**

Level of Cognitive Ability: Evaluating

Client Needs: Safe and Effective Care Environment

Integrated Process: Teaching and Learning

Content Area: Pediatrics—Eye/Ear

Priority Concepts: Client Education; Infection

Reference: McKinney et al. (2013), p. 1509.

395. 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. Because the tonsillar area is so vascular, postoperative bleeding is a concern. Prothrombin time, partial thromboplastin time, platelet count, hemoglobin and hematocrit, white blood cell count, and urinalysis are performed preoperatively. The prothrombin time results would identify a potential for bleeding. Creatinine level, sedimentation rate, and blood urea nitrogen would not determine the potential for bleeding.

Test-Taking Strategy: Note the **strategic word**, most. Focus on the surgical procedure and the **subject** of the question. The **subject** of the question relates to the potential for bleeding. Options 1 and 4 can be eliminated because they relate to kidney function. Option 3 can be eliminated because it is unrelated to the **subject** of the question.

Review: **Tonsillectomy**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Throat/Respiratory

Priority Concepts: Clinical Judgment; Clotting

References: Hockenberry, Wilson (2015), p. 1358.

McKinney et al. (2013), p. 1158.

396. 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. The child should be placed in a prone or side-lying position after the surgical procedure to facilitate drainage. Options 1, 3, and 4 would not achieve this goal.

Test-Taking Strategy: Focus on the **subject**, positioning after tonsillectomy. Focus on the surgical procedure and visualize each of the positions described in the options. Keeping in mind that the goal is to facilitate drainage will direct you to the correct option.

Review: **Positioning guidelines** following **tonsillectomy**

Level of Cognitive Ability: Applying
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Planning
 Content Area: Pediatrics—Throat/Respiratory
 Priority Concepts: Caregiving; Safety
 Reference: McKinney et al. (2013), p. 1158.

397. 2

Rationale: A tonsillectomy is the surgical removal of the tonsils. After tonsillectomy, suction equipment should be available, but suctioning is not performed unless there is an airway obstruction because of the risk of trauma to the surgical site. Monitoring for bleeding is an important nursing intervention after any type of surgery. Milk and milk products are avoided initially because they coat the throat, cause the child to clear the throat, and increase the risk of bleeding. Clear, cool liquids are encouraged.

Test-Taking Strategy: Focus on the **subject**, the prescription that the nurse questions. Option 1 can be eliminated first because this is a nursing action, not a medical prescription. From the remaining options, consider the anatomical location of the surgery. This should direct you to the correct option.

Review: Postoperative care following **tonsillectomy**

Level of Cognitive Ability: Analyzing
 Client Needs: Safe and Effective Care Environment
 Integrated Process: Nursing Process—Implementation
 Content Area: Pediatrics—Throat/Respiratory
 Priority Concepts: Collaboration; Safety
 Reference: Hockenberry, Wilson (2015), p. 1157.

398. 1

Rationale: A tonsillectomy is the surgical removal of the tonsils. Frequent swallowing, restlessness, a fast and thready pulse, and vomiting bright red blood are signs of bleeding. An elevated blood pressure and complaints of discomfort are not indications of bleeding.

Test-Taking Strategy: Focus on the **subject**, a sign of bleeding, and use the concepts related to the signs of shock. These concepts should assist in eliminating options 2 and 4. From the remaining options, recalling that discomfort is expected and does not indicate bleeding will direct you to the correct option.

Review: Signs of **bleeding** following **tonsillectomy**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Pediatrics—Throat/Respiratory
 Priority Concepts: Clinical Judgment; Clotting
 Reference: Hockenberry, Wilson (2015), p. 1175.

399. 1

Rationale: A myringotomy is the insertion of tympanoplasty tubes into the middle ear to promote drainage of purulent middle ear fluid, equalize pressure, and keep the ear aerated. The nurse must instruct parents regarding the administration of antibiotics. Antibiotics need to be taken as prescribed, and the full course needs to be completed. Options 2, 3, and 4 are incorrect. Antibiotics are not tapered, but are administered for the full course of therapy.

Test-Taking Strategy: Focus on the **subject**, understanding of the instructions about antibiotics. Recall that antibiotics must

be taken for the full course, regardless of whether the child is feeling better. This will assist in directing you to the correct option.

Review: Administration of **antibiotics**

Level of Cognitive Ability: Evaluating
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Evaluation
 Content Area: Pediatrics—Eye/Ear
 Priority Concepts: Client Education; Safety
 Reference: Hockenberry, Wilson (2015), p. 1181.

400. 2

Rationale: Strabismus is a condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles. The nurse may suspect strabismus in a child when the child complains of frequent headaches, squints, or tilts the head to see. Other manifestations include crossed eyes, closing one eye to see, diplopia, photophobia, loss of binocular vision, or impairment of depth perception. Options 1, 3, and 4 are not indicative of this condition.

Test-Taking Strategy: Eliminate options 1 and 4 first because they are **comparable or alike** and relate to hearing. To select from the remaining options, recall that this is a condition in which the eyes are not aligned because of lack of coordination of the extraocular muscles.

Review: **Strabismus**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity
 Integrated Process: Nursing Process—Assessment
 Content Area: Pediatrics—Eye/Ear
 Priority Concepts: Clinical Judgment; Sensory Perception
 Reference: Hockenberry, Wilson (2015), p. 846.

❖ 401. 1, 5, 6

Rationale: Acute otitis media is an inflammatory disorder caused by an infection of the middle ear. The child often has fever, pain, loss of appetite, and possible ear drainage. The child also is irritable and lethargic and may roll the head or pull on or rub the affected ear. Otoscopic examination may reveal a red, opaque, bulging, and immobile tympanic membrane. Hearing loss may be noted particularly in chronic otitis media. The child's fever should be treated with ibuprofen. The child is positioned on his or her affected side to facilitate drainage. A soft diet is recommended during the acute stage to avoid pain that can occur with chewing. Antibiotics are prescribed to treat the bacterial infection and should be administered for the full prescribed course. The ear should not be irrigated with normal saline because it can exacerbate the inflammation further. Antihistamines are not usually recommended as a part of therapy. Test-Taking Strategy: Focus on the **subject**, care for the child with acute otitis media, and on the child's diagnosis and note the words acute and right ear. Think about the pathophysiology associated with the disorder and the associated manifestations to select the correct options.

Review: **Acute otitis media**

Level of Cognitive Ability: Analyzing
 Client Needs: Physiological Integrity

Respiratory Disorders

PRIORITY CONCEPTS Gas Exchange; Health Promotion

CRITICAL THINKING What Should You Do?

A child with pneumonia complains of pain in the pleural area on the affected side. What should the nurse do?
Answer located on p. 474.

I. Epiglottitis

A. Description

1. Bacterial form of croup
2. Inflammation of the epiglottis occurs, which may be caused by *Haemophilus influenzae* type b or *Streptococcus pneumoniae*; children immunized with *H. influenzae* type b (Hib vaccine) are at less risk for epiglottitis.
3. Occurs most frequently in children 2 to 8 years old, but can occur from infancy to adulthood
4. Onset is abrupt, and the condition occurs most often in winter.
5. Considered an emergency situation because it can progress rapidly to severe respiratory distress

B. Assessment

1. High fever
2. Sore, red, and inflamed throat (large, cherry red, edematous epiglottis) and pain on swallowing (Fig. 39-1)
3. Absence of spontaneous cough
4. Dysphonia (muffled voice), dysphagia, dyspnea, and drooling
5. Agitation
6. Retractions as the child struggles to breathe
7. Inspiratory stridor aggravated by the supine position
8. Tachycardia
9. Tachypnea progressing to more severe respiratory distress (hypoxia, hypercapnia, respiratory acidosis, decreased level of consciousness)
10. Tripod positioning: While supporting the body with the hands, the child leans forward, thrusts

the chin forward and opens the mouth in an attempt to widen the airway.

C. Interventions

1. Maintain a patent airway.
2. Assess respiratory status and breath sounds, noting nasal flaring, the use of accessory muscles, retractions, and the presence of stridor (Fig. 39-2).
3. Do not measure the temperature by the oral route.
4. Monitor pulse oximetry.
5. Prepare the child for lateral neck films to confirm the diagnosis (accompany the child to the radiology department).
6. Maintain NPO (nothing by mouth) status.
7. Do not leave the child unattended.
8. Avoid placing the child in a supine position because this position would affect the respiratory status further.
9. Do not restrain the child or take any other measure that may agitate the child.
10. Administer intravenous (IV) fluids as prescribed; insertion of an IV line may need to be delayed until an adequate airway is established because this procedure may agitate the child.
11. Administer IV antibiotics as prescribed; these are usually followed by oral antibiotics.
12. Administer analgesics and antipyretics (acetaminophen or ibuprofen) to reduce fever and throat pain as prescribed.
13. Administer corticosteroids to decrease inflammation and reduce throat edema as prescribed.
14. Nebulized epinephrine (racemic epinephrine) may be prescribed for severe cases (causes mucosal vasoconstriction and reduces edema); heliox (mixture of helium and oxygen) may also be prescribed to reduce mucosal edema.
15. Provide cool mist oxygen therapy as prescribed; high humidification cools the airway and decreases swelling.
16. Have resuscitation equipment available, and prepare for endotracheal intubation or tracheotomy for severe respiratory distress.

FIGURE 39-1 A, Normal larynx. B, Obstruction and narrowing resulting from edema of croup.

FIGURE 39-2 Location of retractions.

17. Ensure that the child is up to date with immunizations, including Hib conjugate vaccine (see Chapter 44).

! If epiglottitis is suspected, no attempts should be made to visualize the posterior pharynx, obtain a throat culture, or take an oral temperature. Otherwise, spasm of the epiglottis can occur, leading to complete airway occlusion.

II. Laryngotracheobronchitis

A. Description

1. Inflammation of the larynx, trachea, and bronchi
2. Most common type of croup; may be viral or bacterial and most frequently occurs in children younger than 5 years
3. Common causative organisms include parainfluenza virus types 2 and 3, respiratory syncytial virus (RSV), *Mycoplasma pneumoniae*, and influenza A and B.
4. Characterized by gradual onset that may be preceded by an upper respiratory infection

B. Assessment (Box 39-1)

C. Interventions

1. Maintain a patent airway.
2. Assess respiratory status and monitor pulse oximetry; monitor for nasal flaring, sternal retraction, and inspiratory stridor (see Fig. 39-2).

BOX 39-1 Progression of Symptoms in Laryngotracheobronchitis

Stage I

- Low-grade fever
- Hoarseness
- Seal bark and brassy cough (croup cough)
- Inspiratory stridor
- Fear
- Irritability and restlessness

Stage II

- Continuous respiratory stridor
- Retractions
- Use of accessory muscles
- Crackles and wheezing
- Labored respirations

Stage III

- Continued restlessness
- Anxiety
- Pallor
- Diaphoresis
- Tachypnea
- Signs of anoxia and hypercapnia

Stage IV

- Intermittent cyanosis progressing to permanent cyanosis
- Apneic episodes progressing to cessation of breathing

Adapted from Perry S, Hockenberry M, Lowdermilk D, Wilson D: Maternal-child nursing care, ed 4, St. Louis, 2010, Mosby.

3. Monitor for adequate respiratory exchange; monitor for pallor or cyanosis.
4. Elevate the head of the bed and provide rest.
5. Provide humidified oxygen via a cool air or mist tent as prescribed for a hospitalized child (Table 39-1).
6. Instruct the parents to use a cool air vaporizer at home; other measures include having the child breathe in the cool night air or the air from an open freezer or taking the child to a cool basement or garage.
7. Provide and encourage fluid intake; IV fluids may be prescribed to maintain hydration status if the child is unable to take fluids orally.
8. Administer analgesics as prescribed to reduce fever.
9. Teach the parents to avoid administering cough syrups or cold medicines, which may dry and thicken secretions.
10. Administer corticosteroids if prescribed to reduce inflammation and edema.
11. Administer nebulized epinephrine (racemic epinephrine) as prescribed; this may be prescribed for children with severe disease experiencing stridor at rest, retractions, or difficulty breathing.

TABLE 39-1 Oxygen Delivery Systems: Advantages and Disadvantages

System	Advantages	Disadvantages
Oxygen mask	Various sizes available; delivers higher O ₂ concentration than cannula Able to provide a predictable concentration of oxygen if Venturi mask is used, whether child breathes through nose or mouth	Skin irritation Fear of suffocation Accumulation of moisture on face Possibility of aspiration of vomitus Difficulty in controlling O ₂ concentrations (except with Venturi mask)
Nasal cannula	Provides low-moderate O ₂ concentration (22%-40%) Child is able to eat and talk while getting O ₂ Possibility of more complete observation of child because nose and mouth remain unobstructed	Must have patent nasal passages May cause abdominal distention and discomfort or vomiting Difficulty controlling O ₂ concentrations if child breathes through mouth Inability to provide mist if desired
Oxygen tent	Provides lower O ₂ concentrations (F _I O ₂ up to 0.3-0.5) Child is able to receive desired inspired O ₂ concentrations, even while eating	Necessity for tight fit around bed to prevent leakage of oxygen Cool and wet tent environment Poor access to child; inspired O ₂ levels fall when tent is entered
Oxygen hood, face tent	Provides high O ₂ concentrations (F _I O ₂ up to 1.00) Free access to child's chest for assessment	High-humidity environment Need to remove child for feeding and care

Data from Hockenberry M, Wilson D: Wong's nursing care of infants and children, ed 9, St. Louis, 2011, Mosby.
F_IO₂, Fraction of inspired oxygen; O₂, oxygen.

12. Administer antibiotics as prescribed, noting that they are not indicated unless a bacterial infection is present.
13. Heliox (mixture of helium and oxygen) may be prescribed; this medication reduces the work of breathing, reduces airway turbulence, and helps to relieve airway obstruction.
14. Have resuscitation equipment available.
15. Provide appropriate reassurance and education to the parents or caregivers.

 **Isolation precautions should be implemented for a hospitalized child with an upper respiratory infection until the cause of the infection is known.**

III. Bronchitis

A. Description

1. Inflammation of the trachea and bronchi; may be referred to as tracheobronchitis
2. Usually occurs in association with an upper respiratory infection
3. Is usually a mild disorder; causative agent is most often viral

B. Assessment

1. Fever
2. Dry, hacking, and nonproductive cough that is worse at night and becomes productive in 2 to 3 days

C. Interventions

1. Treat symptoms as necessary.
2. Monitor for respiratory distress.

3. Provide cool, humidified air to the child.
4. Encourage increased fluid intake; child may drink beverages that he or she likes as long as the respiratory status is stable.
5. Administer antipyretics for fever as prescribed.
6. A cough suppressant may be prescribed to promote rest.

IV. Bronchiolitis and Respiratory Syncytial Virus (RSV)

A. Description

1. Bronchiolitis is an inflammation of the bronchioles that causes production of thick mucus that occludes bronchiole tubes and small bronchi.
2. RSV causes an acute viral infection and is a common cause of bronchiolitis (other organisms that cause bronchiolitis include adenoviruses, parainfluenza viruses, and human metapneumovirus).
3. RSV, although not airborne, is highly communicable and is usually transferred by direct contact with respiratory secretions.
4. RSV occurs primarily in the winter and spring.
5. RSV is rarer in children older than 2 years, with a peak incidence at approximately 6 months of age.
6. At-risk children include children older than 1 year of age who have a chronic or disabling condition.
7. Identification of the virus is done via testing of nasal or nasopharyngeal secretions.
8. Prevention measures include encouraging breastfeeding; avoiding tobacco smoke exposure; using

good hand-washing techniques; and administering palivizumab, a monoclonal antibody, to high-risk infants. Palivizumab is administered via intramuscular injection monthly for a 5-month period (usually from November to March).

B. Assessment (Box 39-2)

C. Interventions

1. For a child with bronchiolitis, interventions are aimed at treating symptoms and include airway maintenance, cool humidified air and oxygen, adequate fluid intake, and medications.
2. For a hospitalized child with RSV, isolate the child in a single room or place in a room with another child with RSV.
3. Ensure that nurses caring for a child with RSV do not care for other high-risk children.
4. Use contact and standard precautions during care; using good hand-washing techniques and wearing gloves and gowns are necessary.
5. Monitor airway status and maintain a patent airway.
6. For most effective airway maintenance, position the child at a 30- to 40-degree angle with the neck slightly extended to maintain an open airway and decrease pressure on the diaphragm.
7. Provide cool, humidified oxygen as prescribed.
8. Monitor pulse oximetry levels.
9. Encourage fluids; fluids administered intravenously may be necessary until the acute stage has passed.

BOX 39-2 Assessment: Respiratory Syncytial Virus

Initial Manifestations

- Rhinorrhea
- Eye or ear drainage
- Pharyngitis
- Coughing
- Sneezing
- Wheezing
- Intermittent fever

Manifestations as Disease Progresses

- Increased coughing and wheezing
- Signs of air hunger
- Tachypnea and retractions
- Periods of cyanosis

Manifestations in Severe Illness

- Tachypnea more than 70 breaths/minute
- Decreased breath sounds and poor air exchange
- Listlessness
- Apneic episodes

Adapted from Perry S, Hockenberry M, Lowdermilk D, Wilson D: Maternal-child nursing care, ed 4, St. Louis, 2010, Mosby.

10. Periodic suctioning may be necessary if nasal secretions are copious; use of a bulb syringe for suctioning may be effective. Suctioning should be done before feeding to promote comfort and adequate intake.

11. Administer ribavirin, an antiviral medication, as prescribed,

! Cough suppressants are administered with caution because they can interfere with the clearance of respiratory secretions.

V. Pneumonia

A. Description

1. Inflammation of the pulmonary parenchyma or alveoli or both, caused by a virus, mycoplasmal agents, bacteria, or aspiration of foreign substances.
2. The causative agent usually is introduced into the lungs through inhalation or from the bloodstream.
3. Viral pneumonia occurs more frequently than bacterial pneumonia, is seen in children of all ages, and often is associated with a viral upper respiratory infection.
4. Primary atypical pneumonia, usually caused by *Mycoplasma pneumoniae* or *Chlamydia pneumoniae*, occurs most often in the fall and winter months and is more common in crowded living conditions; it is most often seen in children 5 to 12 years old.
5. Bacterial pneumonia is often a serious infection requiring hospitalization when pleural effusion or empyema accompanies the disease; hospitalization is also necessary for children with staphylococcal pneumonia (*Streptococcus pneumoniae* is a common cause).
6. Aspiration pneumonia occurs when food, secretions, liquids, or other materials enter the lung and cause inflammation and a chemical pneumonitis. Classic symptoms include an increasing cough or fever with foul-smelling sputum, deteriorating results on chest x-rays, and other signs of airway involvement.
7. Prevention of viral and bacterial pneumonia includes immunization of infants and children with heptavalent pneumococcal conjugate vaccine (see Chapter 44).

B. Viral pneumonia

1. Assessment
 - a. Acute or insidious onset
 - b. Symptoms range from mild fever, slight cough, and malaise to high fever, severe cough, and diaphoresis.
 - c. Nonproductive or productive cough of small amounts of whitish sputum
 - d. Wheezes or fine crackles

2. Interventions
 - a. Treatment is symptomatic.
 - b. Administer oxygen with cool humidified air as prescribed.
 - c. Increase fluid intake.
 - d. Administer antipyretics for fever as prescribed.
 - e. Administer chest physiotherapy and postural drainage as prescribed.

C. Primary atypical pneumonia

1. Assessment

- a. Acute or insidious onset
- b. Fever (lasting several days to 2 weeks), chills, anorexia, headache, malaise, and myalgia (muscle pain)
- c. Rhinitis; sore throat; and dry, hacking cough
- d. Nonproductive cough initially, progressing to production of seromucoid sputum that becomes mucopurulent or blood-streaked

2. Interventions

- a. Treatment is symptomatic.
- b. Recovery generally occurs in 7 to 10 days.

D. Bacterial pneumonia

1. Assessment

- a. Acute onset
- b. Infant: Irritability, lethargy, poor feeding; abrupt fever (may be accompanied by seizures); respiratory distress (air hunger, tachypnea, and circumoral cyanosis)
- c. Older child: Headache, chills, abdominal pain, chest pain, meningeal symptoms (meningism)
- d. Hacking, nonproductive cough
- e. Diminished breath sounds or scattered crackles
- f. With consolidation, decreased breath sounds are more pronounced.
- g. As the infection resolves, the cough becomes productive and the child expectorates purulent sputum; coarse crackles and wheezing are noted.

2. Interventions

- a. Antibiotic therapy is initiated as soon as the diagnosis is suspected; in a hospitalized infant or child, IV antibiotics are usually prescribed.
- b. Administer oxygen for respiratory distress as prescribed, and monitor oxygen saturation via pulse oximetry.
- c. Place the child in a cool mist tent as prescribed; cool humidification moistens the airways and assists in temperature reduction.
- d. Suction mucus from the infant, using a bulb syringe, to maintain a patent airway if the infant is unable to handle secretions.
- e. Administer chest physiotherapy and postural drainage every 4 hours as prescribed.
- f. Promote bed rest to conserve energy.

- g. Encourage the child to lie on the affected side (if pneumonia is unilateral) to splint the chest and reduce the discomfort caused by pleural rubbing.
- h. Encourage fluid intake (administer cautiously to prevent aspiration); intravenously administered fluids may be necessary.
- i. Administer antipyretics for fever and bronchodilators as prescribed.
- j. Monitor temperature frequently because of the risk for febrile seizures.
- k. Institute isolation precautions with pneumococcal or staphylococcal pneumonia (according to agency policy).
 1. Administer cough suppressant as prescribed before rest times and meals if the cough is disturbing.
- m. Continuous closed chest drainage may be instituted if purulent fluid is present (usually noted in Staphylococcus infections).
- n. Fluid accumulation in the pleural cavity may be removed by thoracentesis; thoracentesis also provides a means for obtaining fluid for culture and for instilling antibiotics directly into the pleural cavity.

 Children with a respiratory disorder should be monitored for weight loss and for signs of dehydration. Signs of dehydration include a sunken fontanel (infants), non-elastic skin turgor, decreased and concentrated urinary output, dry mucous membranes, and decreased tear production.

VI. Asthma

A. Description

1. Asthma is a chronic inflammatory disease of the airways (see Chapter 54).
2. Asthma is classified on the basis of disease severity; management includes medications, environmental control of allergens, and child and family education.
3. The allergic reaction in the airways caused by the precipitant can result in an immediate reaction with obstruction occurring, and it can result in a late bronchial obstructive reaction several hours after the initial exposure to the precipitant.
4. Mast cell release of histamine leads to a bronchoconstrictive process, bronchospasm, and obstruction.
5. Diagnosis is made on the basis of the child's symptoms, history and physical examination, chest radiograph, and laboratory tests (Box 39-3).
6. Precipitants may trigger an asthma attack (Box 39-4).
7. Status asthmaticus is an acute asthma attack, and the child displays respiratory distress despite

BOX 39-3 Laboratory Tests to Assist in Diagnosing Asthma

Pulmonary Function Tests: Spirometry testing assesses the presence and degree of disease and can determine the response to treatment.

Peak Expiratory Flow Rate Measurement: Measures maximum flow of air that can be forcefully exhaled in 1 second; child uses a peak expiratory flowmeter to determine a “personal best” value that can be used for comparison at other times, such as during and after an asthma attack.

Bronchoprovocation Testing: Testing that is done to identify inhaled allergens; mucous membranes are directly exposed to suspected allergen in increasing amounts.

Skin Testing: Done to identify specific allergens.

Exercise Challenges: Exercise is used to identify the occurrence of exercise-induced bronchospasm.

Radioallergosorbent Test: Blood test used to identify a specific allergen.

Chest Radiograph: May show hyperexpansion of the airways.

Note: Some tests place the child at risk for an asthma attack; testing should be done under close supervision.

vigorous treatment measures; this is a medical emergency that can result in respiratory failure and death if not treated.

B. Assessment

1. Child has episodes of dyspnea, wheezing, breathlessness, chest tightness, and cough, particularly at night or in the early morning or both.
2. Acute asthma attacks
 - a. Episodes include progressively worsening shortness of breath, cough, wheezing, chest tightness, decreases in expiratory airflow secondary to bronchospasm, mucosal edema, and mucus plugging; air is trapped behind occluded or narrow airways, and hypoxemia can occur.
 - b. The attack begins with irritability, restlessness, headache, feeling tired, or chest tightness; just before the attack, the child may present with itching localized at the front of the neck or over the upper part of the back.

- c. Respiratory symptoms include a hacking, irritable, nonproductive cough caused by bronchial edema.
- d. Accumulated secretions stimulate the cough; the cough becomes rattling, and there is production of frothy, clear, gelatinous sputum.
- e. The child experiences retractions.
- f. Hyperresonance on percussion of the chest is noted.
- g. Breath sounds are coarse and loud, with crackles, coarse rhonchi, and inspiratory and expiratory wheezing; expiration is prolonged.
- h. Child may be pale or flushed, and the lips may have a deep, dark red color that may progress to cyanosis (also observed in the nail beds and skin, especially around the mouth).
- i. Restlessness, apprehension, and diaphoresis occur.
- j. Child speaks in short, broken phrases.
- k. Younger children assume the tripod sitting position; older children sit upright, with the shoulders in a hunched-over position, the hands on the bed or a chair, and the arms braced to facilitate the use of the accessory muscles of breathing (child avoids a lying-down position).
- l. Exercise-induced attack: Cough, shortness of breath, chest pain or tightness, wheezing, and endurance problems occur during exercise.
- m. Severe spasm or obstruction: Breath sounds and wheezing cannot be heard (silent chest), and cough is ineffective (represents a lack of air movement).
- n. Ventilatory failure and asphyxia: Shortness of breath, with air movement in the chest restricted to the point of absent breath sounds, is noted; this is accompanied by a sudden increase in the respiratory rate.

C. Interventions: Acute episode (see [Priority Nursing Actions](#))

BOX 39-4 Precipitants Triggering an Asthma Attack

Allergens

Outdoor: Trees, shrubs, weeds, grasses, molds, pollen, air pollution, spores

Indoor: Dust, dust mites, mold, cockroach antigen

Irritants: Tobacco smoke, wood smoke, odors, sprays

Exposure to Occupational Irritants

Exercise

Cold Air

Changes in Weather or Temperature

Environmental Change: Moving to a new home, starting a new school

Colds and Infections

Animals: Cats, dogs, rodents, horses

Medications: Aspirin, nonsteroidal antiinflammatory drugs, antibiotics, beta blockers

Strong Emotions: Fear, anger, laughing, crying

Conditions: Gastroesophageal reflux disease, tracheoesophageal fistula

Food Additives: Sulfite preservatives

Foods: Nuts, milk, other dairy products

Endocrine Factors: Menses, pregnancy, thyroid disease

⚡ PRIORITY NURSING ACTIONS

Acute Asthma Attack

1. Assess airway patency and respiratory status.
2. Administer humidified oxygen by nasal cannula or face mask.
3. Administer quick-relief (rescue) medications.
4. Initiate an intravenous (IV) line.
5. Prepare the child for a chest radiograph if prescribed.
6. Prepare to obtain a blood sample for determining arterial blood gas levels if prescribed.

In the event of an acute asthma attack, several interventions are necessary. First, the nurse assesses airway status to ensure airway patency. If the airway is not patent, emergency interventions such as endotracheal intubation may be necessary. The nurse also quickly assesses the child's respiratory status. If the airway is patent, the nurse administers oxygen by nasal cannula or mask as prescribed. Quick-relief (rescue) medications are administered as prescribed to treat the symptoms. An IV line is initiated so that IV medications can be administered if prescribed. The nurse prepares the child for a chest x-ray to assess airway status and to assist in ruling out a respiratory infection. Blood samples are obtained, and an arterial blood gas may be obtained. When the laboratory results are obtained, the nurse administers medications as prescribed to correct dehydration, acidosis, or electrolyte imbalances. During the episode and during treatment, the nurse continuously monitors respiratory status, pulse oximetry, and color. The nurse also needs to be alert to decreased wheezing or a silent chest, which may signal the inability to move air.

Reference

Hockenberry, Wilson (2015), p. 1228.

D. Medications

1. Quick-relief medications (rescue medications): Used to treat symptoms and exacerbations ([Box 39-5](#))
2. Long-term control medications (preventer medications): Used to achieve and maintain control of inflammation ([Box 39-6](#))
3. Nebulizer, metered-dose inhaler (MDI): May be used to administer medications; if the child has difficulty using the MDI, medication can be administered by nebulization (medication is mixed with saline and then nebulized with compressed air by a machine).

BOX 39-5 Quick-Relief Medications (Rescue Medications)

- Short-acting β_2 agonists (for bronchodilation)
- Anticholinergics (for relief of acute bronchospasm)
- Systemic corticosteroids (for antiinflammatory action to treat reversible airflow obstruction)

BOX 39-6 Long-Term Control (Medications to Prevent Attacks)

- Corticosteroids (for antiinflammatory action)
- Antiallergy medications (to prevent an adverse response on exposure to an allergen)
- Nonsteroidal antiinflammatory drugs (for antiinflammatory action)
- Long-acting β_2 agonists (for long-acting bronchodilation)
- Leukotriene modifiers (to prevent bronchospasm and inflammatory cell infiltration)
- Monoclonal antibody (blocks binding of immunoglobulin E [IgE] to mast cells to inhibit inflammation)

4. If an MDI is used to administer a corticosteroid, a spacer should be used to prevent yeast infections in the child's mouth.
 5. The child's **growth** patterns need to be monitored when corticosteroids are prescribed.
- E. Chest physiotherapy
1. Includes breathing exercises and physical training.
 2. Chest physiotherapy strengthens the respiratory musculature and produces more efficient breathing patterns.
 3. Chest physiotherapy is not recommended during an acute exacerbation.
- F. Allergen control
1. Testing may be done to identify allergens.
 2. Teach the child and parents about measures to prevent and reduce exposure to allergens (see [Box 39-4](#))
- G. Home care measures
1. Instruct the family in measures to eliminate environmental allergens.
 2. Avoid extremes of environmental temperature; in cold temperatures, instruct the child to breathe through the nose, not the mouth, and to cover the nose and mouth with a scarf.
 3. Avoid exposure to individuals with a respiratory infection.
 4. Instruct the child and family in how to recognize early symptoms of an asthma attack.
 5. Teach the child and family how to administer medications as prescribed.
 6. Teach the child and family how to use a nebulizer, MDI, or peak expiratory flowmeter.
 7. Instruct the child and family about the importance of home monitoring of the peak expiratory flow rate; a decrease in the expiratory flow rate may indicate impending infection or exacerbation.
 8. Instruct the child in the cleaning of devices used for inhaled medications (yeast infections can occur with the use of aerosolized corticosteroids).
 9. Encourage adequate rest, sleep, and a well-balanced diet.

10. Instruct the child in the importance of adequate fluid intake to liquefy secretions.
11. Assist in developing an exercise program.
12. Instruct the child in the procedure for respiratory treatments and exercises as prescribed.
13. Encourage the child to cough effectively.
14. Encourage the parents to keep immunizations up to date; annual influenza vaccinations are recommended for children 6 months of age and older.
15. Inform other health care providers (HCPs) and school personnel of the asthma condition.
16. Allow the child to take control of self-care measures, based on age appropriateness.

VII. Cystic Fibrosis

A. Description (Fig. 39-3)

1. A chronic multisystem disorder (autosomal recessive trait disorder) characterized by exocrine gland dysfunction
2. The mucus produced by the exocrine glands is abnormally thick, tenacious, and copious, causing obstruction of the small passageways of the affected organs, particularly in the respiratory, gastrointestinal, and reproductive systems.
3. Common symptoms are associated with pancreatic enzyme deficiency and pancreatic fibrosis caused by duct blockage, progressive chronic lung disease as a result of infection, and sweat gland dysfunction resulting in increased sodium and chloride sweat concentrations.

4. An increase in sodium and chloride in sweat and saliva forms the basis for one diagnostic test, the sweat chloride test (Box 39-7).
5. Cystic fibrosis is a progressive and incurable disorder, and respiratory failure is a common cause of death; organ transplantations may be an option to increase survival rates.

B. Respiratory system

1. Symptoms are produced by the stagnation of mucus in the airway, leading to bacterial colonization and destruction of lung tissue.
2. Emphysema and atelectasis occur as the airways become increasingly obstructed.
3. Chronic hypoxemia causes contraction and hypertrophy of the muscle fibers in pulmonary

BOX 39-7 Quantitative Sweat Chloride Test

Production of sweat is stimulated (pilocarpine iontophoresis), sweat is collected, and sweat electrolytes are measured (more than 75 mg of sweat is needed).

Normally, the sweat chloride concentration is less than 40 mEq/L (40 mmol/L).

Chloride concentration greater than 60 mEq/L (60 mmol/L) is a positive test result (higher than 40 mEq/L (40 mmol/L) is diagnostic in infants younger than 3 months of age).

Chloride concentrations of 40 to 60 mEq/L (40 to 60 mmol/L) are highly suggestive of cystic fibrosis and require a repeat test.

FIGURE 39-3 Various effects of exocrine gland dysfunction in cystic fibrosis.

arteries and arterioles, leading to pulmonary hypertension and eventual cor pulmonale.

4. Pneumothorax from ruptured bullae and hemothysis from erosion of the bronchial wall occur as the disease progresses.
5. Other respiratory symptoms
 - a. Wheezing and cough
 - b. Dyspnea
 - c. Cyanosis
 - d. Clubbing of the fingers and toes
 - e. Barrel chest
 - f. Repeated episodes of bronchitis and pneumonia

C. Gastrointestinal system

1. Meconium ileus in the newborn is the earliest manifestation.
2. Intestinal obstruction (distal intestinal obstructive syndrome) caused by thick intestinal secretions can occur; signs include pain, abdominal distention, nausea, and vomiting.
3. Stools are frothy and foul-smelling.
4. Deficiency of the fat-soluble vitamins A, D, E, and K, which can result in easy bruising, bleeding, and anemia, occurs.
5. Malnutrition and failure to thrive is a concern.
6. Demonstration of hypoalbuminemia can occur from diminished absorption of protein, resulting in generalized edema.
7. Rectal prolapse can result from the large, bulky stools and increased intraabdominal pressure.
8. Pancreatic fibrosis can occur and places the child at risk for diabetes mellitus.

D. Integumentary system

1. Abnormally high concentrations of sodium and chloride in sweat are noted.
2. Parents report that the infant tastes “salty” when kissed.
3. Dehydration and electrolyte imbalances can occur, especially during hyperthermic conditions.

E. Reproductive system

1. Cystic fibrosis can delay puberty in girls.
2. Fertility can be inhibited by the highly viscous cervical secretions, which act as a plug and block sperm entry.
3. Males are usually sterile (but not impotent), caused by the blockage of the vas deferens by abnormal secretions or by failure of normal development of duct structures.

F. Diagnostic tests

1. Quantitative sweat chloride test is positive (see Box 39-7).
2. Newborn screening may be done in some states and may consist of immunoreactive trypsinogen analysis and direct DNA analysis for mutant genes.
3. Chest x-ray reveals atelectasis and obstructive emphysema.

4. Pulmonary function tests provide evidence of abnormal small airway function.
5. Stool, fat, enzyme analysis: A 72-hour stool sample is collected to check the fat or enzyme (trypsin) content, or both (food intake is recorded during the collection).

G. Interventions: Respiratory system

1. Goals of treatment include preventing and treating pulmonary infection by improving aeration, removing secretions, and administering antibiotic medications.
2. Monitor respiratory status, including lung sounds and the presence and characteristics of a cough.
3. Chest physiotherapy (percussion and postural drainage) on awakening and in the evening (more frequently during pulmonary infection) needs to be done every day to maintain pulmonary hygiene; chest physiotherapy should not be performed before or immediately after a meal.
4. A Flutter mucus clearance device (a small, hand-held plastic pipe with a stainless steel ball on the inside) facilitates the removal of mucus and may be prescribed; store away from small children because if the device separates, the steel ball poses a choking hazard.
5. Hand-held percussors or a special vest device that provides high-frequency chest wall oscillation may be prescribed to help loosen secretions.
6. A positive expiratory pressure mask may be prescribed; use of this mask forces secretion to the upper airway for expectoration.
7. The child should be taught the forced expiratory technique (huffing) to mobilize secretions for expectoration.
8. Bronchodilator medication by aerosol may be prescribed; the medication opens the bronchi for easier expectoration (administered before chest physiotherapy when the child has reactive airway disease or is wheezing). Medications that decrease the viscosity of mucus may also be prescribed.
9. A physical exercise program with the aim of stimulating mucus expectoration and establishing an effective breathing pattern should be instituted.
10. Aerosolized or IV antibiotics may be prescribed and administered at home through a central venous access device.
11. Oxygen may be prescribed during acute episodes; monitor closely for oxygen narcosis (signs include nausea and vomiting, malaise, fatigue, numbness and tingling of extremities, substernal distress) because a child with cystic fibrosis may have chronic carbon dioxide retention.
12. Lung transplantation is occasionally performed.

H. Interventions: Gastrointestinal system

1. A child with cystic fibrosis requires a high-calorie, high-protein, and well-balanced diet to

meet energy and **growth** needs; multivitamins and vitamins A, D, E, and K are also administered; for those with severe lung disease, energy requirements may be as high as 20% to 50% or more of the recommended daily allowance.

2. Monitor weight and for failure to thrive.
3. Monitor stool patterns and for signs of intestinal obstruction.
4. The goal of treatment for pancreatic insufficiency is to replace pancreatic enzymes; pancreatic enzymes are administered within 30 minutes of eating and administered with all meals and all snacks (enzymes should not be given if the child is NPO).
5. The amount of pancreatic enzymes administered depends on the HCP's preference and usually is adjusted to achieve normal growth and a decrease in the number of stools to 2 or 3 daily (additional enzymes are needed if the child is consuming high-fat foods).
6. Enteric-coated pancreatic enzymes should not be crushed or chewed; capsules can be taken apart and the contents can be sprinkled on a small amount of food for administration.
7. Monitor for constipation, intestinal obstruction, and rectal prolapse.
8. Monitor for signs of gastroesophageal reflux; place the infant in an upright position after eating, and teach the child to sit upright after eating.

I. Additional interventions

1. Monitor blood glucose levels and for signs of diabetes mellitus.
2. Ensure adequate salt intake and fluids that provide an adequate supply of electrolytes during extremely hot weather and when the child has a fever.
3. Monitor bone growth in the child.
4. Monitor for signs of retinopathy or nephropathy.
5. Provide emotional support to the parents, particularly when the child is diagnosed; parents will be fearful and uncertain about the disorder and the care involved.
6. Provide support to the child as he or she transitions through the stages of growth.
7. Teach the child and parents about the care involved and encourage independence in the child for self-care as age appropriate.

J. Home care

1. Home care involves educating the parents and the child about all aspects of care for the disorder.
2. Inform the parents and child about the signs of complications and actions to take and that the importance of follow-up care is crucial.
3. Instruct the parents to ensure that the child receives the recommended immunizations on schedule; in addition, annual influenza

vaccinations are recommended for children 6 months of age and older.

4. Inform the child and parents about the Cystic Fibrosis Foundation.

 **An alteration in respiratory status can be a frightening experience for the child and parents. A calm and reassuring nursing approach assists in reducing fear.**

VIII. Sudden Infant Death Syndrome (SIDS)

A. Description

1. SIDS refers to unexpected death of an apparently healthy infant younger than 1 year for whom an investigation of the death and a thorough autopsy fail to show an adequate cause of death.
2. Several theories are proposed regarding the cause of SIDS, but the exact cause is unknown.
3. SIDS most frequently occurs during winter months.
4. Death usually occurs during sleep periods, but not necessarily at night.
5. SIDS most frequently affects infants 2 to 3 months of age.
6. Incidence is higher in boys.
7. Incidence is higher in Native Americans, African Americans, and Hispanics and in lower socioeconomic groups.
8. Incidence has been found to be lower in breastfed infants and infants sleeping with a pacifier.
9. High-risk conditions for SIDS:
 - a. Prone position
 - b. Use of soft bedding, sleeping in a noninfant bed such as a sofa
 - c. Overheating (thermal stress)
 - d. Cosleeping
 - e. Mother who smoked cigarettes or abused substances during pregnancy
 - f. Exposure to tobacco smoke after birth

B. Assessment

1. Infant is apneic, blue, and lifeless.
2. Frothy blood-tinged fluid is in the nose and mouth.
3. Infant may be found in any position, but typically is found in a disheveled bed, with blankets over the head, and huddled in a corner.
4. Infants may appear to have been clutching bedding.
5. Diaper may be wet and full of stool.

C. Prevention and interventions

1. Infants should be placed in the supine position for sleep.
2. Mother needs to be taught about the risk factors: cigarette smoking and substance **abuse** during pregnancy; use of soft bedding, sleeping in a noninfant bed such as a sofa; overheating (thermal stress); cosleeping; exposure to tobacco smoke after birth. Stuffed animals or other toys should

be removed from the crib while the infant is sleeping.

3. Teach the parents to monitor for positional plagiocephaly caused by the supine sleeping position; signs include flattened posterior occiput and development of a bald spot in the posterior occiput area.
4. To assist in preventing positional plagiocephaly, teach the parents to alter head position during sleep, avoid excessive time in infant seats and bouncers, and place the infant in a prone position while awake (monitor the infant when in the prone position).
5. If SIDS occurs, the parents need a great deal of support as they grieve and mourn, especially because the event was sudden, unexpected, and unexplained.

IX. Foreign Body Aspiration

A. Description (Fig. 39-4)

1. Swallowing and aspiration of a foreign body into the air passages
2. Most inhaled foreign bodies lodge in the main stem or lobar bronchus.
3. Most common offending foods are round in shape and include items such as hot dogs, candy, peanuts, popcorn, or grapes.

B. Assessment

1. Initially, choking, gagging, coughing, and retractions are general findings.
2. If the condition worsens, cyanosis may occur.
3. Laryngotracheal obstruction leads to dyspnea, stridor, cough, and hoarseness.
4. Bronchial obstruction produces paroxysmal cough, wheezing, asymmetrical breath sounds, and dyspnea.

5. If any obstruction progresses, unconsciousness and asphyxiation may occur.
6. Partial obstructions may occur without symptoms.
7. Distressed child cannot speak, becomes cyanotic, and collapses.

C. Interventions

1. Emergency care
 - a. Interventions for the removal of a foreign body (or relief of choking) in a child (1 year of age or older) are the same as for the adult client. See Chapter 54 for this information.
2. After instituting emergency care measures, removal by endoscopy may be necessary.
 - a. After endoscopy, the child receives high-humidity air.
 - b. Observe for signs and symptoms of airway edema.
3. Prevention
 - a. Keep small objects, including rubber balloons, out of reach of small children.
 - b. Avoid giving small children small, round food items.
4. Parent, day care provider, and babysitter education
 - a. Teach about the hazards of aspiration.
 - b. Discuss potential situations in which small items may be aspirated.
 - c. Teach about the symptoms of aspiration.
 - d. Teach how to perform emergency care measures.

X. Tuberculosis

A. Description

1. Tuberculosis is a contagious disease caused by *Mycobacterium tuberculosis*, an acid-fast bacillus (see Chapter 54).

FIRST-DEGREE OBSTRUCTION

Obstruction allows passage of air in both directions

SECOND-DEGREE OBSTRUCTION

Air able to move past the obstruction in one direction only. Air passages enlarge during inspiration and diminish during expiration.

COMPLETE OBSTRUCTION

Air unable to move in either direction. FB and edematous mucosa obliterate passage.

FIGURE 39-4 Mechanisms of airway obstruction by a foreign body (FB).

2. Multidrug-resistant strains of *M. tuberculosis* occur because of child or family noncompliance with therapeutic regimens.
3. The route of transmission of *M. tuberculosis* is through inhalation of droplets from an individual with active tuberculosis.
4. There is an increased incidence in urban low-income areas, nonwhite racial or ethnic groups, and first-generation immigrants from endemic countries.
5. Most children are infected by a family member or by another individual with whom they have frequent contact, such as a babysitter.

B. Assessment

1. Child may be asymptomatic or develop symptoms such as malaise, fever, cough, weight loss, anorexia, and lymphadenopathy.
2. Specific symptoms related to the site of infection, such as the lungs, brain, or bone, may be present.
3. With increased time, asymmetrical expansion of the lungs, decreased breath sounds, crackles, and dullness to percussion develop.

C. Tuberculin skin test (TST) or Mantoux test (Box 39-8)

1. The test produces a positive reaction 2 to 10 weeks after the initial infection.
2. The test determines whether a child has been infected and has developed a sensitivity to the protein of the tubercle bacillus; a positive reaction does not confirm the presence of active disease (exposure versus presence).
3. After a child reacts positively, the child will always react positively; a positive reaction in a previously negative child indicates that the child has been infected since the last test.
4. Tuberculosis testing should not be done at the same time as measles immunization (viral interference from the measles vaccine may cause a false-negative result).

BOX 39-8 Tuberculin Skin Test (Mantoux Test) Interpretation

Induration measuring 15 mm or more is considered to be a positive reaction in children 4 years or older who do not have any risk factors.

Induration measuring 10 mm or more is considered to be a positive reaction in children younger than 4 years and in children with chronic illness or at high risk for exposure to tuberculosis.

Induration measuring 5 mm or more is considered to be positive for the highest risk groups, such as children with immunosuppressive conditions or human immunodeficiency virus (HIV) infection.

D. Sputum culture

1. A definitive diagnosis is made by showing the presence of mycobacteria in a culture.
2. Chest x-rays are supplemental to sputum cultures and are not definitive alone.
3. Because an infant or young child often swallows sputum rather than expectorates it, gastric washings (aspiration of lavaged contents from the fasting stomach) may be done to obtain a specimen; the specimen is obtained in the early morning before breakfast.

E. Interventions

1. Medications

- a. A 9-month course of isoniazid may be prescribed to prevent a latent infection from progressing to clinically active tuberculosis and to prevent initial infection in children in high-risk situations; a 12-month course may be prescribed for a child infected with human immunodeficiency virus (HIV).
- b. Recommendation for a child with clinically active tuberculosis may include combination administration of isoniazid, rifampin, and pyrazinamide daily for 2 months, and then isoniazid and rifampin twice weekly for 4 months.
- c. Inform the parents and child that bodily fluids, including urine, may turn an orange-red color with some tuberculosis medications.
- d. Directly observed therapy may be necessary for some children.

2. Place children with active disease who are contagious on respiratory isolation until medications have been initiated, sputum cultures show a diminished number of organisms, and cough is improving; this includes use of a personally fitted air-purifying N95 or N100 respirator (mask) by the nurse caring for the child.
3. Stress the importance of adequate rest and adequate diet.
4. Instruct the child and family about measures to prevent the transmission of tuberculosis.
5. Case finding and follow-up with known contacts is crucial to decrease the number of cases of individuals with active tuberculosis.

CRITICAL THINKING What Should You Do?

Answer: For a child with pneumonia, in order to reduce the discomfort in the pleural area, the nurse should encourage the child to lie on the affected side (if pneumonia is unilateral) to splint the chest. This position reduces the discomfort associated with pleural rubbing. A mild analgesic may be administered if prescribed.

Reference: Hockenberry, Wilson (2015), p. 1195.

PRACTICE QUESTIONS

402. A 10-year-old child with asthma is treated for acute exacerbation in the emergency department. The nurse caring for the child should monitor for which sign, knowing that it indicates a worsening of the condition?
1. Warm, dry skin
 2. Decreased wheezing
 3. Pulse rate of 90 beats/minute
 4. Respirations of 18 breaths/minute
403. The mother of an 8-year-old child being treated for right lower lobe pneumonia at home calls the clinic nurse. The mother tells the nurse that the child complains of discomfort on the right side and that ibuprofen is not effective. Which instruction should the nurse provide to the mother?
1. Increase the dose of ibuprofen.
 2. Increase the frequency of ibuprofen.
 3. Encourage the child to lie on the left side.
 4. Encourage the child to lie on the right side.
404. A new parent expresses concern to the nurse regarding sudden infant death syndrome (SIDS). She asks the nurse how to position her new infant for sleep. In which position should the nurse tell the parent to place the infant?
1. Side or prone
 2. Back or prone
 3. Stomach with the face turned
 4. Back rather than on the stomach
405. The clinic nurse is providing instructions to a parent of a child with cystic fibrosis regarding the immunization schedule for the child. Which statement should the nurse make to the parent?
1. "The immunization schedule will need to be altered."
 2. "The child should not receive any hepatitis vaccines."
 3. "The child will receive all of the immunizations except for the polio series."
 4. "The child will receive the recommended basic series of immunizations along with a yearly influenza vaccination."
406. The emergency department nurse is caring for a child diagnosed with epiglottitis. In assessing the child, the nurse should monitor for which indication that the child may be experiencing airway obstruction?
1. The child exhibits nasal flaring and bradycardia.
 2. The child is leaning forward, with the chin thrust out.
 3. The child has a low-grade fever and complains of a sore throat.
 4. The child is leaning backward, supporting himself or herself with the hands and arms.
407. A child with laryngotracheobronchitis (croup) is placed in a cool mist tent. The mother becomes concerned because the child is frightened, consistently crying and trying to climb out of the tent. Which is the most appropriate nursing action?
1. Tell the mother that the child must stay in the tent.
 2. Place a toy in the tent to make the child feel more comfortable.
 3. Call the health care provider and obtain a prescription for a mild sedative.
 4. Let the mother hold the child and direct the cool mist over the child's face.
408. The clinic nurse reads the results of a tuberculin skin test (TST) on a 3-year-old child. The results indicate an area of induration measuring 10 mm. The nurse should interpret these results as which finding?
1. Positive
 2. Negative
 3. Inconclusive
 4. Definitive and requiring a repeat test
409. The mother of a hospitalized 2-year-old child with viral laryngotracheobronchitis (croup) asks the nurse why the health care provider did not prescribe antibiotics. Which response should the nurse make?
1. "The child may be allergic to antibiotics."
 2. "The child is too young to receive antibiotics."
 3. "Antibiotics are not indicated unless a bacterial infection is present."
 4. "The child still has the maternal antibodies from birth and does not need antibiotics."
410. The nurse is caring for an infant with bronchiolitis, and diagnostic tests have confirmed respiratory syncytial virus (RSV). On the basis of this finding, which is the most appropriate nursing action?
1. Initiate strict enteric precautions.
 2. Move the infant to a room with another child with RSV.
 3. Leave the infant in the present room because RSV is not contagious.
 4. Inform the staff that they must wear a mask, gloves, and a gown when caring for the child.
- ❖ 411. The nurse is preparing for the admission of an infant with a diagnosis of bronchiolitis caused by

respiratory syncytial virus (RSV). Which interventions should the nurse include in the plan of care? Select all that apply.

- 1. Place the infant in a private room.
- 2. Ensure that the infant's head is in a flexed position.
- 3. Wear a mask at all times when in contact with the infant.

- 4. Place the infant in a tent that delivers warm humidified air.
- 5. Position the infant on the side, with the head lower than the chest.
- 6. Ensure that nurses caring for the infant with RSV do not care for other high-risk children.

ANSWERS

402. 2

Rationale: Asthma is a chronic inflammatory disease of the airways. Decreased wheezing in a child with asthma may be interpreted incorrectly as a positive sign when it may actually signal an inability to move air. A “silent chest” is an ominous sign during an asthma episode. With treatment, increased wheezing actually may signal that the child's condition is improving. Warm, dry skin indicates an improvement in the child's condition because the child is normally diaphoretic during exacerbation. The normal pulse rate in a 10-year-old is 70 to 110 beats/minute. The normal respiratory rate in a 10-year-old is 16 to 20 breaths/minute.

Test-Taking Strategy: Note the word worsening in the question. Options 3 and 4 can be eliminated because they are **comparable or alike** in that they are normal vital signs. From the remaining options, recall that a “silent chest” is an ominous sign during an asthma episode and indicates severe bronchial spasm or obstruction.

Review: **Bronchial spasm** and care of the child with **asthma**

403. 4

Rationale: Pneumonia is an inflammation of the pulmonary parenchyma or alveoli, or both, caused by a virus, mycoplasma agents, bacteria, or aspiration of foreign substances. Splinting of the affected side by lying on that side may decrease discomfort. It would be inappropriate to advise the mother to increase the dose or frequency of the ibuprofen. Lying on the left side would not be helpful in alleviating discomfort.

Test-Taking Strategy: Options 1 and 2 can be eliminated because they are **comparable or alike**. Recall that the nurse does not adjust the dose or frequency of medications. Recalling the principles related to splinting an incision in the postoperative client will assist in directing you to the correct option because these principles can be applied in this situation.

404. 4

Rationale: SIDS is the unexpected death of an apparently healthy infant younger than 1 year for whom an investigation of the death and a thorough autopsy fail to show an adequate cause of death. Several theories are proposed regarding the cause, but the exact cause is unknown. Nurses should encourage parents to place the infant on the back (supine) for sleep. Infants in the prone position (on the stomach) may be unable to move their heads to the side, increasing the risk of suffocation. The infant may have the ability to turn to a prone position from the side-lying position.

Test-Taking Strategy: Eliminate options 1, 2, and 3 because they are **comparable or alike**. Remember that the infant needs to be placed on his or her back.

405. 4

Rationale: Cystic fibrosis is a chronic multisystem disorder (autosomal recessive trait disorder) characterized by exocrine gland dysfunction. The mucus produced by the exocrine glands is abnormally thick, tenacious, and copious, causing obstruction of the small passageways of the affected organs, particularly in the respiratory, gastrointestinal, and reproductive systems. Adequately protecting children with cystic fibrosis from communicable diseases by immunization is essential. In addition to the basic series of immunizations, a yearly influenza immunization is recommended for children with cystic fibrosis. Options 1, 2, and 3 are incorrect.

Test-Taking Strategy: Eliminate options 1, 2, and 3 because they are **comparable or alike**, indicating that the immunization schedule will be adjusted in some way. Recalling the importance of protection from communicable diseases, particularly in children with a disorder such as cystic fibrosis, will assist in directing you to the correct option.

406. 2

Rationale: Epiglottitis is a bacterial form of croup. A primary concern is that it can progress to acute respiratory distress. Clinical manifestations suggestive of airway obstruction include tripod positioning (leaning forward while supported by arms, chin thrust out, mouth open), nasal flaring, the use of accessory muscles for breathing, and the presence of stridor. Option 4 is an incorrect position. Options 1 and 3 are incorrect because epiglottitis causes tachycardia and a high fever.

Test-Taking Strategy: Focus on the **subject**, manifestations of airway obstruction in a child with epiglottitis. Eliminate option 1 first because tachycardia rather than bradycardia would occur in a child experiencing respiratory distress. Eliminate option 3 next, knowing that a high fever occurs with epiglottitis. From the remaining options, visualize the descriptions in each and determine which position would best assist a child experiencing respiratory distress.

Review: Manifestations of **epiglottitis**

Level of Cognitive Ability: Analyzing

Client Needs: Physiological Integrity

Integrated Process: Nursing Process—Assessment

Content Area: Pediatrics—Throat/Respiratory

Priority Concepts: Clinical Judgment; Gas Exchange

407. 4

Rationale: Laryngotracheobronchitis (croup) is the inflammation of the larynx, trachea, and bronchi and is the most common type of croup. Cool mist therapy may be prescribed to liquefy secretions and to assist in breathing. If the use of a tent or hood is causing distress, treatment may be more effective if the child is held by the parent and a cool mist is directed toward the child's face (blow-by). A mild sedative would not be administered to the child. Crying would increase hypoxia and aggravate laryngospasm, which may cause airway obstruction. Options 1 and 2 would not alleviate the child's fear.

Test-Taking Strategy: Note the **strategic words**, most appropriate. Focus on the **subject**, the child's fear. Options 1, 2, and 3 are **comparable or alike** in that they do not address the fear. The correct option is the one that addresses the **subject** of the question.
